This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

+ *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.

+ *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.

+ *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.

+ *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at `http://books.google.com/`

CHAPTER XXV.

CHILD STUDY IN THE UNITED STATES.[1]

Child study has a special advantage from the standpoint of utility as well as from that of science; it not only requires rigid investigation, but whatever defect or abnormality may be found in a child is much more easily eliminated or modified than in the case of the adult.

It is often difficult to trace the origin of any movement. Although the initiatory impulse to child study was from the Continent of Europe, yet more perhaps has been done in America in the study of children than in all the rest of the world. It is therefore true that child study owes its development to our own country. Many movements are inaugurated which afterwards languish, either on account of prematureness or from want of insight into their relation to the environment at the time; those who develop and make them useful to civilization receive from society the credit.

There were few scientific observations of child life in America previous to 1880. At about this time Dr. G. Stanley Hall began investigations on this line, and continued his inquiries up to the present time. It is due to him that child study in this country has developed and become of general interest.

In the case of teachers, Dr. Hall's purpose has been gradually to concentrate all psychology, philosophy, and ethics about child study. This is in accordance with the tendencies of evolution in all fields of investigation, and its purpose is to aid in placing educational methods on a more scientific basis. In the words of Dr. Hall himself, the child-study movement is slowly doing a work "for studies of the mind not unlike that which Darwin did for the methods of nature study, or that embryology has done for anatomy, viz, cross sectioning the old methods of analysis and classification of the powers and activities of the adult consciousness by bringing in a genetic method, based not upon abstraction, like Spencer's, but on a copious collection of carefully made and critically sifted objective data."

No endeavor is here made to mention the large number of those who, under the inspiration of Dr. Hall, have contributed to this movement.

We have endeavored to give some of the results of the investigations in brief, others as illustrations of work and method and others in detail, and often in the words of the report. We have selected rather

CHILDREN'S DRAWINGS.

Professor Barnes, of Leland Stanford Junior University, believes that through a child's drawings[1] we can learn something of the way the child thinks and feels.

In order that the drawings should have some common element for comparison, a little poem was selected from Der Struwel-Peter, and was called "Hans Guck-in-die-Luft." The following is the English translation:

STORY OF JOHNNY LOOK-IN-THE-AIR.

As he trudged along to school,
It was always Johnny's rule
To be looking at the sky
And the clouds that floated by;
But what just before him lay,
In his way,
Johnny never thought about;
So that everyone cried out,
"Look at little Johnny there,
Little Johnny Look-in-the-Air."

Running just in Johnny's way,
Came a little dog one day;
Johnny's eyes were still astray
Up on high, in the sky,
And he never heard them cry,
"Johnny, mind, the dog is nigh!"
What happens now?
Bump!
Dump!
Down they fell, with such a thump
Dog and Johnny in a lump!
They almost broke their bones,
So hard they tumbled on the stones.

The following conclusions, according to Professor Barnes, would seem to be borne out by the study on these pictures:

1. Drawing is for the young child a language, a means of expressing ideas.
2. Children naturally adopt symbols and conventional forms to express what they want to say.
3. The courage to express ideas through drawing increases in California children until they are 13 or 14 years old and then steadily decreases.
4. The child thinks in small units; his intellectual processes are fragmentary and broken.
5. Children like to draw large, distinct figures, expressed with few lines.
6. Children draw full faces until they are 9 years old, and after that profiles.
7. In drawing figures children are most interested in the head; hence they draw single figures facing their left.
8. A child uses color naturally for decorative effect; for the drawings he prefers strong black or white.
9. Children select the dramatic points in a story well, and their pictures are naturally full of movement.
10. In a story a child is most attracted by the scene just preceding the catastrophe.
11. The humane instinct in children is far stronger than the destructive instinct.
12. There is very little difference between the drawings made by the boys and those made by the girls.

THE HEARING OF CHILDREN.

In Table 4 Oscar Chrisman,[1] of Clark University, shows the results of various investigations as to the hearing of school children. In Von Gossler's line, 8, in this table, under "defective hearing," the 2.18 per cent refers to the higher schools

[1] Ped. Seminary, December, 1893.

Digitized by Google

and the 1.8 per cent to the lower schools. Zhermunski gives results for both whispering obtained in the ordinary way and results from the use of Politzer's acoumeter. W. stands for whispering and P. for Politzer's acoumeter. It is difficult to tell how to classify defective hearing. Schmiegelow makes three classes; he gives (I) for those hearing the ticking of a watch at a distance less than 2 meters, and (II) for those hearing between 2 and 4 meters. The parentheses around the watch distances indicate that though the watch was used the results were given in whispering.

The normal reach of hearing is the distance at which all children are counted as having defective hearing.

Children's Rights as Seen by Themselves.

In order to obtain without prejudice the ideas of children as to their own rights, Margaret E. Schallenberger,[1] of Leland Stanford Junior University, sent out a syllabus to some hundreds of teachers in California. The teachers wrote stories upon the blackboard and the children answered any questions involved, finished incomplete stories, etc. They wrote their opinions as language exercises, having no idea of the use to be made of them. Three thousand papers were sent in. The following is the story:

"Jennie had a beautiful new box of paints; and in the afternoon, while her mother was gone, she painted all the chairs in the parlor, so as to make them look nice for her mother. When her mother came home, Jennie ran to meet her, and said, 'Oh, Mamma, come and see how pretty I have made the parlor;' but her mamma took her paints away and sent her to bed. If you had been her mother, what would you have done or said to Jennie?"

The results from the answers (given below the double rule in the table) were reduced to the number per 1,000 for the whole number examined in each case.

Some of the most striking results are the reasons given for punishing Jennie; one is for the sake of revenge, another is to prevent a repetition of the act, and a third is for the purpose of reforming Jennie.

Of 2,000 children six years of age some would explain to Jennie why it was wrong to paint the parlor chairs. The young children think of the results of an action; if it is bad, punishment should follow. But the older children consider the motive that led to the action. The boys show much less mercy than the girls. Out of 1,000 girls six years of age 512 would whip Jennie; out of the same number of boys, 590 would whip her. At sixteen 52 girls and 133 boys would whip her.

Threats and forced promises made very little impression. At six years of age out of 2,000 none would threaten; at twelve years, 39; at fifteen years, 85. Threats probably appeal to children so little on account of their indefiniteness as to time.

MOTOR ABILITY.

The following preliminary study of motor ability was made by J. A. Hancock,[1] of Clark University. The purpose of this study was to find (1) what movements children can make best; (2) to learn something more definite of the relative ability of children and adults, and of the relation between development and decline of motor ability, and (3) to find simple tests for incipient nervous diseases.

In order to carry this study out, the following series of suggestions and questions were used as tests. Two or three pupils were taken at a time.

FIRST SERIES.

1. Ask the child to stand with feet close together and hands at sides. Is there any swaying of the body? Try same with eyes closed. What difference?
2. Have him walk across the room backward with eyes closed. (Keep near him to prevent falling.) Is there any dragging of either foot, walking with feet wide apart, or turning to right or left?
3. Have him try to sit still a half minute exactly. Note all the movements he makes in the effort. Does he hold his breath?
4. Ask him to close his eyes and hold his hands out horizontally with the fingers spread. Is there tremor or twitching of the fingers? Which ones and in what directions? Is it slight or distinct?

[1] Ped. Seminary, October, 1894.

Digitized by Google

5. Hold your hands above your head out of sight and with palms front. Ask him to do the same. Does he raise them to the same height? Hold them symmetrically? Are the fingers or thumbs spread apart on either hand? Which? Which hand sinks first on a half minute's trial? Hold up your own hands but a moment.
6. Place him 10 feet away. Toss back and forth ten times a ball as large as a tennis ball. How and where does he throw it? How many times does he catch it?
7. Ask the boys to lie down on their backs, if they are willing. How do they get up? Have they difficulty?
8. Ask for the pronunciation of these letters and words and note errors: r, l, s, t, k, d, f, n, v, y, go, which, thin, the, long, show.
9. What signs of mental fatigue have you noticed in him in school work? Has he made any involuntary movements during these tests?
10. Please add any comments or suggestions that may occur to you.

SECOND SERIES.

1. Does the child dress himself? Button his clothing, and fasten hooks and eyes?
2. Can he tie the ends of a string together? In what kind of a knot?
3. Can he thread a needle? How small a one! In which hand does he hold it?
4. Can he interlace slats? Interlace four and six before him. See patterns 1 and 2. Does he even copy the pattern?
5. Can he wind thread on a spool? How does he do it?
6. Can he spin a top made of half a spool or of a button mold? Can he snap a marble?
7. Can he hop on each foot? Stand on tiptoes or heels? Touch his knees or shoes while standing?
8. Place before him pattern number three; give him squares of paper or square blocks; ask him to imitate it. Then show him number four. Does he shift the outer blocks of number three to make the other figure, or does he build anew from the beginning? The patterns may be shown him drawn full size on paper or made of the blocks. If he fails, divide each pattern vertically in the middle; try him and note results.
9. Count and beat time, double, treble, and quadruple. Can he do it? Rapidly?
10. Does he swing his arms or sway his body when walking? Can he march, keeping step as you count time or play for him? Can he run and keep time? Does he, when marching, move the head, eyes, mouth, or tongue?
11. Pat the top of your head and at the same time move the other hand in a circle on the breast. Can he imitate you?
12. Rest your forearms on the table, the hands in an easy position, with the fingers curved and the lower parts of the palms and the tips of the fingers touching the surface of the table. Begin tapping, letting the movements proceed rapidly from the little fingers to the thumbs. Ask him to imitate you. Notice the movements he actually makes. Are they with the hand and arm moving together from the elbow; the whole hand moving from the wrists; all of the fingers moving in unison from the knuckles; or with index fingers alternating with the other three? Reverse the tapping, beginning with the thumbs. Can he imitate you any better? Just what does he do?
13. Can he drive a nail, or hit it squarely after several trials when started for him?
14. Can he roll a hoop? Skate? Turn a somersault, or walk on his hands? (The boy, of course).
15. What movement seems to you the most difficult for children to learn?

The ages of the children tested were five, six, and seven; all were in the first year of school work. An apparatus known as an ataxeograph was employed to study the ability of children to keep quiet.

As the position of the body requires a coordination of a large number of the largest muscles, a test would show something of the control of these muscles. The child stood with feet close together and hands at sides. The child was asked to keep his attention on a distant object, and try to stand still for a minute. The amount of movement was measured; then the child rested for half a minute, and the test was repeated with eyes closed, and the amount of movement or swaying measured. The amount of movement is much greater for children than for men. The rectangles that would just contain the tracings of the instrument in the anterior-posterior and lateral directions were measured and are given in the following tables:

35 boys	5	5.8000	5.2228	6.6810	5.7675
22 girls	5	5.7773	4.9500	5.5400	5.0954
47 boys	6	5.1148	4.2660	5.6957	5.1637
18 girls	6	5.0611	3.7277	5.6000	4.3333
23 boys	7	4.9608	4.2434	6.0086	5.4521
13 girls	7	3.9538	3.2769	4.8230	3.7615

In studying the movements, we see from Table 6 above that 110 were steadier with the eyes open than with them shut; 48 with eyes closed. As the child was shorter he would sway less than the man.

With eyes open, there was an increase of control in each year. The girls were steadier than the boys.

In order to study the steadiness of shoulder and finger, Jastrow's automatograph[1] was employed.

The averages for both men and children were as follows:

TABLE 7.

Number of persons.	Age in years.	Eyes open.		Eyes closed.	
		Perpendicular movement.	Lateral movement.	Perpendicular movement.	Lateral movement.
		Cm.	*Cm.*	*Cm.*	*Cm.*
25 men	.....	.242	.752	.156	1.460
18 boys	5	.816	3.400	1.027	4.916
15 girls	5	.833	3.940	.780	4.706
34 boys	6	1.191	4.258	.805	5.058
12 girls	6	.423	3.883	1.825	4.166
14 boys	7	.500	3.750	.428	5.207
10 girls	7	.410	3.580	.480	3.550

The seventh table shows the relative difference of control in child and man to be greater.

TABLE 8.

Number of persons.	Age in years.	Eyes open.		Eyes closed.	
		Vertical movement.	Lateral movement.	Vertical movement.	Lateral movement.
		Cm.	*Cm.*	*Cm.*	*Cm.*
The men	.....	0.0975	0.0911	0.085	0.110
17 boys	5	.985	.532	.794	.680
14 girls	5	.580	.337	.714	.453
32 boys	6	.396	.378	.689	.534
12 girls	6	.394	.319	.535	.395
13 boys	7	.419	.282	.693	.442
8 girls	7	.300	.356	.312	.365

Table 8 above gives the results in testing the control of the entire arm by the tremograph. This instrument multiplies the movement four times; the results are reduced accordingly, and show the same general relations as in the other table.

Explanation of Table 11.

The names are arranged according to the order of birth. The date of the first edition of the biography and the date when written in case of autobiography are given. Under "family data" are given, in column 1, first the time exact (Ex.) or approximate (Ap.) of the time between the birth of the great man and the previous child or marriage, and second, the average time between the birth of the children of the same family. Column 2 shows the number for which there are data, and upon which the second set of figures in column 1 is based. Column 3 shows first the number of living children, or those who are old enough to have any influence upon the great man, and second, the number born to the parents of the great man, but does not include half-brothers or half-sisters; these are indicated by X. Y. means "young;" O. S. means "only son;" Y. S. "youngest son." Column 4 shows the age of the father and of the mother at the time of birth of the great man. Under "Education," "Home" refers to education by father, mother, or some one of the family; "Private" to instruction by a private teacher at home or in the house of the instructor.

AVERAGE NUMBER OF CHILDREN.

The average number of children in the family is 6+. This includes all the children born to the parents of the great man, but no half brothers or sisters. The time between the birth of the previous child of the marriage and the great man child is 22.87 months for 26 cases, while the average time between children of the family is 25.36 months for 33 cases. These latter facts seem to illustrate the biological law of judicious use of a function.

POSITION IN THE FAMILY.

By birth, 11 are "only sons" and 16 are youngest sons. The position by birth can be shown by a line, A being the first child, B the middle child, C the youngest child, E the older half, and F the younger half, of the family, as follows:

9	15	4	5	8
A	E	B	F	C

Practically the 50 lived in this position:

19	13	2	5	11
A	E	B	F	C

From these results it will be seen that by birth the chances of greatness are as 24 is to 13 and practically as 32 to 16—that is, as 2 to 1 in favor of a child of the older half of the family. This confirms Galton's opinion.

PHYSICAL HEALTH.

Some biographers seem to have a tendency to contrast mental greatness with physical weakness. This may be due to the persistent idea that the body is inversely as the mind. But ill health is not a condition of greatness.

GENERAL STATEMENTS.

In regard to place of living in childhood, a large number resided in the country.

The influence of poverty on great men is well known.

Great men have strong memories in the lines of their interests, although they may be very absent-minded generally speaking.

A careful study would probably show that in boyhood great men had more imagination than the average child. The popular idea that the great man owes his success to his mother's influence upon his education has at least many exceptions. The men given in the table above did owe much of their education to some one person, but often the mother's place was supplied by that of an aunt or other relative.

It is well known how unreliable are the estimates of the early childhood of great men, but at present there is a more scientific spirit in biographical writing, which, it is hoped, will counteract the usual tendency to exaggeration.

BARNARD CLUB SCHOOL OF CHILD STUDY.

The following syllabus for observations of children by the Barnard Club School of Child Study, of Providence, R. I., is given.

The syllabus contains "suggestions for the study of children from the second to the sixth year of school."

SYLLABUS 2.

Introduction.

This simple outline for child study has been prepared with the hope that it may aid primary teachers in coming into closer personal relation with their pupils, and that by the systematic study of a few children they may come to a better knowledge of child life and child nature.

Digitized by Google

Great delicacy and tact are required, however, in attempting this work, for the child studied must not suspect that he is the object of observation, and whenever direct questions are asked he should feel that they are prompted by friendly interest and not by curiosity.

It is recommended that only a few typical children in each class be studied in detail, but many points may easily be learned with regard to all the children. Walks through the school district will reveal much about their environment. Calls at the homes of the children under special study will bring out still more, while many points may be gained through oral or written exercises, which may be so planned as to come legitimately in the time devoted to language or natural science.

This work should not be taken up simply as an interesting psychological study, but rather approached reverently, remembering that the object sought is a deeper insight into the life and thought of the little child who has been "set in our midst."

   Form.
   Number.
   Pitch.
   Rythm.
   Location.
2. Memory.
   Events.
      Distinct or indistinct.
      Accurate or modified by imagination.
   Verbal. Accurate or inaccurate.
3. Imagination.
   Feeble or active.
   Creative or imitative, as shown in play, picture making to stories.
4. Feelings.
   Affections. For people; for animals.
   Fears.
5. Will.
   Power of attention.
   Self-control.
   Impulsive or thoughtful, reflective.
   Power of choice. Prompt or vacillating.
   Obstinate, resolute, or changeable in purpose.
6. Power of observation.
   Accurate or inaccurate.
7. Expression.
   Does the child express his whole thought or only a fragment of it?
   Vocabulary. Large or small.
   Rich or scanty in imagery.
   Is the child predominantly thoughtful, imaginative, emotional, active, or are all three characteristics well balanced?
8. Manners and morals.
   Obedient or disobedient.
   Tidy or untidy.
   Careful or careless.
   Persistent or easily discouraged.
   Polite or rude.
   Truthful or untruthful.
   Humane or cruel.

THE IOWA SOCIETY FOR CHILD STUDY.

Henry Sabin,[1] late State superintendent of public instruction of the State of Iowa, says in a paper to the teachers of that State:

The supreme object of the child's education is the child himself. Books, teachers, courses of study, methods, are but means to an end, and that end is to put the child in complete possession of all his powers, to fit him for the work of life. The new study of practical psychology is intended to acquaint the teacher with the nature of the child. The science is yet in its infancy, but many of the greatest educational minds in the country are working along the lines indicated in this circular.

The first topic investigated by this society was on "eye-mindedness" and "ear-mindedness." It was desired to learn the impressions made upon the ear and eye. Those who remember chiefly through the impressions upon the sense of hearing are called "ear-minded;" of sight, "eye-minded."

EYE-MINDEDNESS AND EAR-MINDEDNESS.

The following is the plan of investigation:

In this line of investigation the comparative value of recollection through impressions made upon the ear and eye is sought. Persons who recall chiefly through impressions made upon the sense of hearing are called ear-minded; those who recall chiefly through impressions made upon the sense of sight are called eye-minded; for example, in spelling, some recall the letters in a word by their sounds, others flash the letters before them in the "mind's eye," and read them as from the printed page. It is thought that the latter, the eye-minded, are the best spellers, and if these investigations point to the same conclusion, steps may be taken to develop eye-mindedness in the poor spellers.

Digitized by Google

Three sets of tests are to be made: Auditory, visual, and audo-visual. For each test prepare ten series of letters, each series containing ten letters, arranged disconnectedly, after the following manner:

1. l, d, n, r, v, g, b, h, s, m.
2. g, x, k, p, t, a, o, q, j, z, etc.

Provide pupils with pencil and paper. Have pupils place at head of sheet name of city, grade, name of pupil, age, nationality.

I. *Auditory test.*—Pronounce slowly, about one letter a second, and distinctly the first series, ten letters, and then give command to write. Pupils must not be permitted to begin to write until the command is given, and they must write without hesitation all the letters they can, and then stop. Then pronounce the next series in the same way, and so on till the pupils have written the ten series.

II. *Visual test.*—Take the second set and write the first series on the blackboard as promptly as possible and in full view of each pupil; then erase quickly and give the command to write. Pupils write under same limitations as in auditory test. Proceed in same manner with the remaining nine series.

III. *Audo-visual test.*—Take the third set and write on the blackboard, as in the visual test; then have pupils pronounce first series in concert. Erase, and then give command to write. Pupils write under same limitations as in visual test. Proceed in same manner with the remaining nine series.

Write these three tests on the same sheet, using both sides of sheet, if necessary. If there be objections to giving pupils' names, numbers may be used, but designate the sex of the pupils. Place the average standing, or teacher's estimate, in spelling of each pupil, at the top of his paper after these tests have been made. Mark it: "Spelling, —— per cent."

The Illinois Society for Child Study.

The following is a plan for the study of child's motives, suggested by the Illinois Society for child study:

Preconceptions and theories of the observer should not be permitted to manifest themselves to the observed, and thus influence and modify the observations recorded.

Plan for the study of child's motives

Name of the child. Age in years and months.
Nativity of father. Nativity of mother.
Occupation of father. Of mother.
Occupation of other members of family.
In what does the child take most interest at the present time?
(*a*) In what stories or books?
(*b*) In what games or entertainments?
(*c*) In what occupations?
What is the child's idea of an adult occupation for himself when grown? Reason for choice?
What experience has thus far afforded the child his greatest pleasure or joy in life?
What life experience has occasioned the greatest pain to the child?
Is the child a member of any school at present? Grade? If left wholly to his own choice would the child attend school? What seems to be the child's true motive for his choice?
Do the mere possibilities of extended social life, comradeship, furnish a leading interest in the child's school attendance?
Is there any portion of his school duties which he performs from a sense of the intrinsic charm in the thing done?
What study interests the child most? What is the real motive prompting this interest?
Name in order of relative interest other subjects of the course? (*a*), (*b*), (*c*). What seems the child's real motive why he pursues these subjects?
What portion of his school duties seem least attractive to the child, and why?
Is the child in good general health? What serious sickness, if any, has the child experienced?
Does the child's physical development appear to be normal? State any apparent defects. Are these the result of (*a*) Heredity? (*b*) Out of school environment? (*c*) Faulty school provisions? Does the child's mental development appear to be normal? State any apparent defects. Are these the results of (*d*) Heredity? (*e*) Faulty out of school environment? (*f*) Injurious school methods, etc.?

CHILDREN'S INTEREST.

In investigations on children's interests Professor Barnes concludes (1) that children are impressed to a very small extent by the visible aspect of things; (2) that their chief interest is in the use of things; (3) that their ideas possess only light abstract characteristics. Edward R. Shaw,[1] of the school of pedagogy, New York University, considers these conclusions as significant since they are at variance with the general practice of teachers in schoolroom work; for to appeal to primary children, in order to get them interested, we must start with the use of objects and gradually lead out from what things can do and what they are made of, to their structure, form, color, etc. In the present investigation by Dr. Shaw the data were gathered from children of a large city. The list of words used was given to children in classes from the second to the sixth school year, inclusive, and was placed before them in the following manner: Each child was directed to write his name, age, and grade at the top of the paper. As each word of the list was spoken and immediately written on the blackboard, the child was to write down as rapidly as possible whatever came into his mind. The work upon one word was completed before the next word was given out. No comments, questions, or suggestions were allowed, so that the pupil might be as unbiased as possible. The object was to see what associations arose in children's minds when the names of the objects in the list were presented.

The list of heads given in the table consists of ten used by Professor Barnes and eight additional ones.

Dr. Shaw collated 59,223 attributes (see Table 12) from 600 pupils, 50 girls and 50 boys of each year of age from 8 years to 13, inclusive. The idea of "use" in Barnes's returns stands 50 per cent as compared to 12 per cent in Shaw's returns. Shaw makes of special importance the difference found in the younger child's interest as compared with the more advanced pupil. The younger child's interest is self-centered—that is, for particular and individual action, as opposed to the older child's recognition of general or universal use. The terms "use," "used," "useful," "good for," "valuable," etc., are frequent with advanced pupils but rare with the younger ones. Barnes's results are almost the exact opposite; yet both investigations point to the conclusion that children's interests lie largely in what an object is good for, or what it can do.

TABLE 12.—*Showing proportion of different attributes by returns from 50 boys and 50 girls of each age from 8 to 13, inclusive.*

[The numbers denote the number of attributes.]

Rank.	8 years.	9 years.	10 years.	11 years.	12 years.	13 years.	Totals.	Grand total.

TABLE 13.

The story.	Third grade.	Fifth grade.	Seventh grade.	Ninth grade.	Second year, high school.	Fourth year, high school.	Seventh grade (self-reading).	University.	Miss Aiken's school.	Average for first six columns.
James	85	76	90	91	93	93	92	75	93	88
Mack,	27	56	80	81	93	83	92	85	93	71
ten years old,	20	20	28	58	68	69	50	50	57	43
a farmer's son,	17	28	40	54	55	55	70	60	52	41
dreamed	70	85	89	87	84	84	87	65	100	83
that his father	79	90	92	85	94	78	92	85	93	86
and mother	89	97	95	93	93	91	94	90	100	93
died	92	97	90	96	95	93	98	95	100	95
very poor,	19	22	25	30	28	40	40	30	47	27
and left him nothing	76	96	93	98	87	88	86	80	100	90
but 37 cents,	85	78	93	89	89	85	76	75	87	78
a loaf of bread,	73	93	96	95	99	97	96	90	100	89
and a Bible.	64	78	94	94	95	93	96	90	100	83
The day after the funeral	29	36	50	57	50	48	58	45	43	45
he had	13	37	38	23	31	30	46	25	47	28
to take these,	6	15	21	29	28	27	14	25	20	21
leave	21	34	40	36	35	30	62	45	27	32
his home	18	24	32	29	26	24	54	50	23	27
and his school,	13	15	16	15	17	20	38	15	10	16
and go out alone	21	43	48	42	68	48	36	35	53	46
into the wide world.	26	55	57	62	68	60	46	45	67	52
It was Sunday,	10	10	23	33	32	32	16	20	30	23
and a lame,	10	15	12	21	29	24	10	15	33	18
crooked,	10	10	23	29	31	39	20	35	47	23
little	3	3	5	9	13	15	12	35	37	7
old	41	66	84	74	85	59	74	80	90	67
woman,	58	81	90	91	95	92	94	90	93	84
with a red	20	20	24	40	37	43	34	40	63	30
shawl	23	21	24	45	35	46	34	30	57	32
on her head, said,	14	18	19	34	21	29	18	15	37	22
"Please give me your Bible.'	44	73	87	81	85	79	88	65	71	77
He did.	41	70	90	88	90	89	84	70	80	76
Soon he met	21	39	56	44	62	39	48	45	50	43
three	21	34	39	38	42	26	30	30	37	34
boys	33	72	78	73	66	59	78	35	70	63
who looked	22	52	58	61	59	46	72	7	70	49
so hungrily	22	54	68	83	77	66	72	50	77	61
at his bread	9	35	33	30	53	30	40	25	50	31
(so) that	1	16	18	20	27	24	20	25	33	15
he gave it.	49	78	89	93	90	89	82	80	100	74
Then came	0	3	1	1	3	0	0	0	7	1
a ragged	10	5	18	27	23	18	6	10	23	16
black	8	12	12	26	22	24	14	15	17	17
beggar,	20	42	44	50	57	67	44	60	57	48
with a stub	1	3	3	18	14	14	10	10	17	8
pipe,	5	4	7	21	21	15	10	25	20	12
one	6	20	34	29	39	27	18	15	20	27
leg,	7	24	38	34	43	33	22	40	37	31
and a crutch,	10	18	32	30	20	31	20	25	23	23
and into his hat	23	40	37	36	36	34	32	30	70	34
James	4	5	16	15	5	9	0	15	30	9
dropped	10	27	28	21	29	21	28	15	50	20
all	8	19	17	27	32	27	14	10	43	21
his money.	45	80	92	86	90	89	82	70	90	90
To a blind	10	24	34	33	27	26	16	20	43	25
schoolmate,	11	21	26	36	43	36	18	40	53	28
with no cap,	19	31	43	44	46	37	58	35	50	36
James	1	4	8	10	7	4	0	5	7	5
gave his.	13	44	62	70	70	66	66	65	80	55
To a half-	8	26	37	27	18	18	14	10	47	22
naked,	10	28	36	27	23	29	16	10	53	23
sickly	0	0	5	3	5	2	12	0	7	2
fiddler	3	17	25	28	27	17	48	15	23	19
boy,	17	41	48	37	36	30	46	30	50	35
with a lean	2	10	17	26	24	18	20	15	37	15
monkey,	5	19	29	38	29	23	40	20	50	24
he gave	21	50	79	76	77	78	64	80	97	62
his coat	23	48	76	75	75	79	58	75	87	62
and pants.	19	60	73	71	74	75	54	70	80	62
At night,	7	21	33	28	29	32	28	25	23	26
in a wood,	44	80	89	96	90	91	86	100	93	82
he found	29	48	62	78	80	82	58	75	73	63
a lost	6	18	10	11	8	7	8	5	13	10
baby,	57	88	100	99	99	96	86	95	100	90
naked,	18	50	64	64	68	57	48	70	77	53
crying;	15	23	25	26	26	18	30	30	13	21
and as it was dark	4	8	13	24	25	30	10	15	37	17
took off	28	49	68	58	63	57	34	65	90	55

One of the facts brought out was the early age at which children reach their maximum memory power. The boys in the second year of the high school remembered 43 per cent, which was the highest for boys.

To study the strength of memory as a function of the place of the words in the story it was divided into three equal parts, and the total number of words remembered in each part by the different grades calculated; the results are shown in the first three lines of Table 14, below. The story was again divided into eight equal parts and the total number of terms remembered in each of these parts by the different grades calculated. The results are given in the lower part of Table 14; the last vertical column of figures gives the average per cent of terms remembered in each part of the story by all grades. The line of figures at the bottom of the table shows the per cent of the whole story remembered by the grades under which the numbers are written. A considerable number remembered the first part of the story quite well, but very little in the latter part, showing the influence of fatigue. The high per cents for Miss Aiken's school may be due to special training.

	17	18	26	26	31	29	30	35	33	28	32	30	16	16	45	20

Among other things it is interesting to notice that the four terms, "mother," "died," "and left him," and "baby," were the only terms remembered by 90 per cent. Table 15 is on basis of 50, but last two columns have 100 for basis. "Christmas," "Santa Claus," and "box of candy," though near end of story, are remembered very well. "37 cents" and "dropped" have each two rows of figures; one gives number who remembered, the other the number who substituted synonym.

CONCLUSIONS.

For a story like the one employed, and under the conditions described above, the maximum memory power is reached at a relatively early age. The boys in the third grade remembered only 17 per cent of the story. In the ninth grade they remembered 42 per cent, and in the high school about 40 per cent. From this it seems that memory power for the boys culminates about the beginning of the high-school period. The girls made a rapid increase from 18 per cent in the third grade to 43 per cent in the seventh grade and 47 per cent in the high school.

The office of a term in the sentence, and the number of like terms employed determined how well a given term was remembered. It may be said that sentences as wholes were remembered inversely in proportion to their length and the number of nonessentials contained. Of the sixteen terms remembered by 75 per cent, eleven are in the first three sentences, and not one in the last half of the story, Table 13. About two-thirds of the forty-one terms remembered by 50 per cent are in the first half of the story. The decline of memory for the successive parts of the story is shown by the per cents for the three-part division of the story, Table 14. They are, successively, 46, 38, and 27. A four-part division would give 52, 34, 32, and 28. Much of the falling off is doubtless due to fatigue, but some of it is due to changes in subject-matter, as can be seen in Table 13, where sudden variations are found in the amount remembered. A decline in memory from the first to the last of the story was found in all grades, but the rate of decline was not the same in all.

Digitized by Google

The growth of memory is more rapid in the case of girls than boys, and here the figures suggest a coincidence with the general law, that the rapid development incident to puberty occurs earlier in girls than in boys. No other appreciable difference between the memory of boys and that of girls is apparent, except that the girls remembered 4 per cent more of the story than the boys, and the girls in higher grades showed a better retaining power for the latter part of the story.

It is surprising how few remembered some terms in a sentence, while other terms in the same sentence were remembered by a large number. There seemed to be marked similarity of apperception in all the different grades; for any term remembered by a large or small number in one grade was remembered by approximately the same number in every other grade. No part of the story nor any term other than those elsewhere mentioned made a noticeable appeal to any grade which did not in like manner appeal to all the other grades.

Drawings by First-Grade Pupils.

Frank S. Bogardus[1] remarks that drawings by first-grade pupils may be made the index of the childrens' mental characteristics.

He used drawing as a test of perceptive imagination and memory in a class of 18 pupils, from five to seven years of age, in the primary department of a normal training school. The class had been in school seven months. The method of testing was as follows:

1. *In perception.*—The object was placed before the child, and after making any kind of examination of it he wished he drew it, the object remaining before him.
2. *In memory.*—The object was placed before the children as a class. The examiner called their attention to certain characteristics, so as to be sure that they all had the same material to remember, and then removed the object and had it drawn as remembered.
3. *In imagination.*—The child was told to make up a story about a boy and a dog or any familiar animal, and then to make a picture of it.

In no instance did two children draw at the same table.

The grading was done in the following manner:

1. *In perception.*—The examiner counted up the number of different elements found in each set of drawings, and, taking that as the standard, compared each individual drawing with it, making the number of different elements or the amount of detail the decisive factor.
2. *In memory.*—The method of grading was essentially the same as in perception, except that the number of elements pointed out by the examiner was taken as the standard.
3. *In imagination.*—The greatest number of different elements found in any one drawing was used as the standard.

In this way statistics more or less truly indicative of the comparative powers of the children in perception, memory, and imagination were secured.

From the study of these statistics the following facts were noticed:

1. In thirteen of the eighteen cases there seemed to be a distinct relationship between the grades in perception, memory, and imagination, the greatest variation in any one case being a difference of 12 per cent between perception and imagination.
2. The highest average made by any one pupil was 82 per cent, the lowest 38 per cent.

The average of the whole class on perception was 59⅔ per cent; on memory, 59⅓ per cent, and in imagination 60 per cent.

4. The various averages of the individuals afforded a means by which they were ranked. The opinions of the teachers of these children agreed with the order in which they were ranked in all but three or four cases out of the eighteen.

Now comes the question of the application of these statistics to the needs of the individual child. Suppose that the drawing examiner finds that James has an average in perception of 15 per cent. He apprises the science teacher of that fact, and she immediately understands the cause of his poor work and sets about correcting it; or the examiner finds that Mary has a low average in memory. He notifies Mary's arithmetic and reading teachers, and they see that what Mary needs is drill in grasping and holding ideas. If John's imaginative powers are found to be less than the average of his class, his reading teacher must pay particular attention to securing an instantaneous response with a mental picture to an external suggestion.

In short, the system serves to establish the standard of the mental powers of the class, to detect the exact place of each child's development that is exaggerated or minimized, and in that way suggests a particular way in which each child must be treated according to his individuality.

Total	315	165	112	88	.....	31	10	7

Individual tests were made for illusions of taste, motion, heat, and cold touch. In Table 19, below, letter R means that an illusion was produced in the description of the five preceding divisions; O, indicates "no illusion;" RR, very marked illusion; J, jerked hand from table; S, scratched hand; "soda," tastes like soda; Il. O. S., illusion without stimulation; T, illusion after stimulation; W, illusion of heat waves. In the results under "Motion," the leaders mark cases in which the camel[1] was brought to move parallel with the line of vision as well as at right angles to that line.

INFERENCES AND APPLICATIONS.

The aim of this study, as a whole, has been to present data bearing on the suggestibility of normal children. A careful study of the records seems to indicate, according to Dr. Small, that in healthy children suggestibility is—

1. A universal condition.
2. High in degree.
3. Largely within the control of any one who knows the working of the child mind.

No thoughtful educator can fail to make from the same records a multitude of inferences related to every department of instruction. Among these inferences, some of the more important are:

1. The necessity of removing from the public schools stutterers, emotional prodigals, and nervous defectives.
2. The need of care that the teaching force is large enough to prevent teachers from breaking down because of overwork.
3. The prominence of the motor element in learning and the importance of calling it into play in teaching.
4. Ground for urging a fuller and higher use of the dramatic instinct in the class room.

If it should seem at first that giving play to the impulse for dramatic action is likely to make pupils stagy and artificial, it will be remembered that the danger lies in too little freedom for dramatic expression. The amateur only is stagy; the actor who knows the stage reflects from the footlights nothing but perfect human naturalness.

Of course it is necessary to guard against the dangerous element in plays of the circus group; this is easily done by learning the actual source of the danger and diverting the attention to something safe that will cause the same flow of spirits and awaken a sense of power and superiority. One of the best ways for securing this result would be to induce boys and girls to invent new games calling for suppleness, strength, skill, and competition, to supplement those now in use and the courses in manual and industrial training.

5. A possible use of the social instinct as it crops out in school fads to awaken interest in studies like history, literature, and science.
6. The danger in leaving children too much alone, and the necessity of closer companionship with children on the part of parents and teachers.
7. In suggestion as children use it, a hint at the natural method of child discipline.
8. The strong influence of the attitude of the teacher upon the tastes and ideals of the pupil.
9. That although a bright teacher may interest pupils in a study, large sympathies, personal interest in the pupil, and ability to appreciate the good in him, are necessary to awaken purpose and develop strong character.

A Study of Dolls.

It may be asked, What is the real source of the many instincts that are expressed in doll play, its form among savage races, whether it is related to idolatry, and, if so, how? The study of dolls by A. C. Ellis and G. Stanley Hall calls attention to the importance of a neglected but rich field of investigation.

The following questionaire was circulated by Miss S. E. Wiltse among some 800 teachers and parents:

The data desired are juvenile feelings, acts, or thoughts toward any object which represents a baby or a child.

1. Describe your dolls and get children to do the same—whether of wax, rags, paper, pasteboard, rubber china, wood, stone, etc.—and give instances where clothespins, nails, bottles, vegetables, sticks, flowers, keys, button hooks, etc., have been regarded as dolls in any respect or in any degree.
2. Feeding: What foods, liquid or solid, and how are they given? Describe imaginary foods, dishes, spoons, and other utensils. Is there any regularity or system in feeding, and are hunger, starvation, food preferences, or growth imagined?
3. Medicines, diseases: What diseases, pains, symptoms, are imagined? How is sympathy shown? What drugs are given? How, and with what conceptions? Imaginary doll doctors, their visits and functions. Surgical operations, etc.
4. What constitutes the death of a doll? Funeral services, and burial of dolls. When lost or crushed do children assume a future life for the doll, and does this assuage their grief?
5. Give details of psychic acts and qualities ascribed to dolls, and show how real, how treated, etc., are their feelings of cold, fatigue, anger, pain, jealousy, love,

Digitized by Google

hate, goodness and badness, modesty, tidiness, etc. Is any individuality or moral or other characters consistently and persistently ascribed to dolls?

6. Dolls' names: Are they of real persons; and if so, is there any resemblance, real or fancied?

7. Accessories and furnishings, toilet articles, clothes, beds, tables, and dishes, trunks, fashion and its changes, toys for the doll, etc: How far in fact are these carried, and how far should they be? What dangers, if any, here?

8. Doll families, and the relationship of the members; doll schools, doll parties, balls, entertainments, weddings.

9. Doll discipline, hygiene, and regimen: What toilet and what rewards and punishments are usual, and what moral qualities are aimed at?

10. Dolls' sleep: How are they put to sleep? What are the favorite lullabies, and does the doll's sleep keep the children good and quiet?

11. Dress: What is the influence of dolls upon the children? Can taste in dress, tidiness, thoroughness in making their clothes, or other moral qualities be cultivated? How does the material of which the doll is made and the degree of lifelike perfection react on the child? Is there regularity and persistency in the care of dolls? Is imagination best stimulated by rude dolls, which can be more freely and roughly used? Are children better morally, religiously, socially, or better prepared for parenthood and domestic life by them? How can the educational value of dolls be better brought out?

The above points are intended to be merely suggestive, and are, of course, far more comprehensive than any returns are expected to be.

Read this syllabus and write down with accuracy any facts which memory or observation may suggest, carefully specifying age, sex, and nationality.

Or, if practical, question children, or, if in a normal school, let teachers take this syllabus as a lesson on the blackboard in the psychology of childhood, and each record memory or observation.

Returns addressed as below will be carefully edited, credited, printed.

G. STANLEY HALL.

CLARK UNIVERSITY,
Worcester, Mass., November, 1894.

The returns from the above questionaire were of various degrees of merit. Ninety-four boys are reported on; the rest are girls. The majority of all were written by young girls and women, between 14 and 24.

Mr. A. C. Ellis issued the following supplementary syllabus:

"Will each person receiving this kindly answer, briefly, on this paper and return it to the address below? State age and sex."

1. Did you ever play with dolls? 2. Did you especially enjoy it? 3. About what age did you begin and stop? (Age in figures.) 4. Did you ever play with paper dolls? 5. At what age did you begin and stop? 6. Did paper dolls dull your interest for other dolls? 7. Did you ever play with anything else as a doll, such as a cat, pillow, vegetable, stick, clothespin, etc., either dressed or without dress? 8. Did you enjoy this as much as your real dolls? 9. Had you plenty of child companions? 10. Did you prefer playing with dolls alone or with other children? 11. Did you prefer old and well-used or new dolls? 12. Between the ages of 1 and 6 did you prefer large or small dolls? 13. From 1 to 5 did you prefer your doll to be, and be dressed, as a baby, child, or adult? 14. Between 5 and 10 did you prefer baby, child, or adult? 15. Between 10 and 15 did you prefer baby, child, or adult? 16. Did your love of dolls grow out of love for a real baby? 17. When you stopped playing dolls was it because your love was transferred to a real baby? 18. Why did you stop playing dolls? 19. Describe your favorite doll, or any other, if you had no favorite. 20. How did you chiefly punish dolls when you were under 6? 21. How when older? 22. At what age did you first play that dolls died? 23. Did you ever try to feed dolls? 24. Did you ever think your dolls were hungry? 25. Did you ever think your dolls were sick? 26. Did you ever think your dolls were cold, tired, hungry, good, bad, jealous, loving you, hating anyone? 27. Which of the following ways of playing with dolls were your favorites: (1) Dressing and washing or sewing for dolls; (2) feeding; (3) nursing; (4) funerals or burials; (5) doll parties, weddings, or schools; (6) punishing; (7) putting to sleep; (8) making imaginary companions of your dolls to talk with and tell your secrets, or to build air castles with? 28. Do you know a mother now very fond of her children who was not fond of dolls as a girl? 29. Do you know of a woman who was very fond of dolls, but is not now very fond of children?

A. CASWELL ELLIS.

beginning doll play was two years and eigh

Digitized by Google

was four years and five months. The same method is followed in column 5. For question 7 the upper number designates whether children played with anything else as if it were a doll. For question 10 the upper figure designates alone, the lower with others. For question 11 also the order of words in the syllabus is followed, the upper figure designating old, the lower new, and in question 12 the upper figure designates the preference for large and the lower small dolls. In 22 the minus sign means never played that dolls died, while the other figures designate the average age in years and months when death was played. In question 26 the upper figure designates the number of those who ascribed any one or more of the psychic qualities named in the question to doll, and the lower number designates the number of those who assigned none, leaving it to the supplementary table to show the relative frequency of each of the qualities.

From above table it appears that of average city-school children below six years, 82 per cent of boys and 98 per cent of girls have played dolls; between six and twelve years, 76 per cent of boys and 99 per cent of girls; of high-school girls, 100 per cent.

Those confessing that they ever specially enjoyed doll play are: Below six years, 77 per cent of boys, 95 per cent of girls; between six and twelve years, 78 per cent of boys, 97 per cent of girls; of high-school girls, 82 per cent.

Those ever having used substitutes are: Below six years, 15 per cent of boys, 48 per cent of girls; between six and twelve years, 35 per cent of boys, 68 per cent of girls; of high-school girls, 58 per cent. Thus girls appear to lead the boys in every grade. Nearly 50 per cent of the girls, and a little less of the boys, answering in all grades, said they loved the substitutes as much as real dolls.

Paper dolls had been used by 73 per cent of those below six years, by 80 per cent between six and twelve years, by 92 per cent of high-school girls. Interest in other dolls was thought dulled by paper dolls by 34 per cent of boys and 26 per cent of girls below six, 35 per cent of boys, and 15 per cent of girls between six and twelve, 44 per cent of high-school girls.

Of all kinds of children—blind, deaf, foreign, etc.—only 17 per cent speak of lack of child companionship, and 72 per cent prefer playing dolls in company; 38 per cent say that love of dolls grew out of love of real baby, and 13 per cent transferred their doll love to babies; 79 per cent had tried to feed dolls; 66 per cent have thought dolls hungry; 68 per cent have ascribed to dolls some of the psychic qualities mentioned; 67 per cent have thought them sick.

According to Louise Maitland, it is difficult to attach any real importance to the formal statements of the writers as to their belief or disbelief as children in ghosts.

The more or less vivid descriptions of fear in ninety-three cases are the most important features of the study.

In reply to the question, "Is there a stage in the development of children when they are prone to believe in and be frightened by debasing superstitions?" Miss Maitland finds:

First, that such a stage is clearly suggested; for while 58 did not believe or remember, 56 believed in ghosts or something similar, and 33 are doubtful as to what they did believe.

Of the 171 writers, 34 per cent presumably had no fear, since they either disbelieved in ghosts or had no fear of them. Of the 66 per cent remaining, 60 per cent mention fear, showing that fear almost universally accompanies the belief in ghosts.

One remedy is distinctly pointed out by the 41 writers who say that disbelief was taught to them. A study of the sources of information affords us another hint. Since we can not altogether prevent our children from hearing these superstitions from people who more or less believe in them, it would be a wise precaution to let them hear the truth at the same time. But more important perhaps than this is the suggestion contained in that part of these papers concerning a belief in other spirits, viz: That we may substitute harmless or even ennobling fancies in place of the baser sort.

Peculiar and Exceptional Children.

Dr. Bohannon, of Clark University, gives the results of reports from 1,045 peculiar or exceptional children—613 girls and 432 boys. These reports come from answers to the following syllabus:[1]

If you desire to receive the syllabi of this school year, to cooperate in collecting data, and to receive the final reports of the work, you are hereby respectfully invited:

First. To think over your own childhood and consider if you were a striking illustration of any of the following types; and if so, describe your case.

Second. Consider if you have any friends who would come into any of the classes below, and ask them to describe their own case.

Third. If you have children of your own, or if you are a teacher, if any of your pupils, past or present, are strikingly exceptional, describe them.

Fourth. If you are a college or normal instructor, explain very fully what is wanted, and ask each pupil to describe one or more such cases in a composition, essay, or a theme in psychology.

Fifth. State the salient points concerning any exceptional children you ever read of, whether fact or fiction, referring to the source if you can.

The following are types suggested to select from, but any others will be welcome:

1. *Physical.*—Exceptional beauty or ugliness; largeness or smallness; any bodily deformity; conspicuous scars or traumatic lesions; defects of sense or limb, as dimness of vision or slightly under normal hearing, weakness of spine, legs, or arms, etc.; exceptional strength, agility, clumsiness or deftness, or gifts of sense; any other marked physical peculiarity.

2. *Psychical.*—A child of exceptional courage or timidity; cleanliness or dirtiness; order or disorder; obedience or disobedience; truth telling or lying; cruelty or sympathy; selfishness or generosity; loquacity or silence; frankness or secretiveness; buoyancy or despondency; daintiness or gluttony; a blasé or otherwise spoiled child; a doubter, investigator, or critic; a buffoon; a restless, fickle scatter-brain or a tenacious child; an ugly and ill-tempered child; a careless, easy-going or a fastidious child; an inquisitive, imaginative, or poetic child; a teaser or hector; a nervous child; a querulent, whining child; a dignified and self-poised child, or one who acts habitually with abandon.

It is not a description of one or more of the above traits that is wanted, but an account of one or more individual cases where one trait or group of traits is so marked as to color the entire character of the child, to be known to all who see much of it, to therefore bear on the child's future career.

Note in each case, if you can, whether the trait is hereditary; in which parent, how far back can it be traced, and how marked was it in the ancestry? To this point the greatest importance is attached, and it should receive special attention.

Give, briefly, specific acts or instances of the manifestation of the trait.

---

[1] The Pedagogical Seminary, Vol. IV, No. 1, October, 1896.

Digitized by Google

State how each case has been treated at home and in school, and how you think it should be.

Always describe each case with the greatest conciseness and with the greatest fidelity to fact.

Always state age, sex, nationality, complexion, and temperament.

Always write on but one side of your paper.

Begin every new case on a new page.

Write at the head of the first page of each case one or more words designating the type, as a dirty child, a precocious child, etc.

There are 43 types of individuals of various ages represented in the answers, but nearly all are below the period of early manhood or womanhood.

In giving a statistical analysis of the results, the types were divided into three groups based on the worth to the individual of the various peculiarities—(1) the advantageous, (2) the neutral, and (3) the disadvantageous peculiarities.

In the advantageous peculiarities are found the tall, heavy, stout, strong, agile, deft, beautiful, clean, generous, sympathetic, buoyant, orderly, obedient, courageous, and those having keen sense powers.

In the neutral peculiarities are found the buffoons, frank, loquacious, imaginative, inquisitive, dignified, teasers, silent, and the dainty.

To the disadvantageous peculiarities belong the dirty, ill-tempered, small, timid, whining, disorderly, disobedient, cruel, gluttonous, selfish, those with sense defects, bodily weakness, ugly, nervous, deformed, spoiled, birth-marked, liars, clumsy.

From Table 23 it will be seen that the advantageous peculiarities are inherited more than twice as much (0.629) as the disadvantageous (0.281).

YOUTHFUL DEGENERACY.

According to Professor Lancaster, degeneration is "a gradual change of the structure in which the organism becomes adapted to less varied and less complex conditions of life." In applying this term to man, Morel considers degeneration as a "morbid deviation from an original type."

In the following investigation of degeneracy, G. E. Dawson,[1] Fellow in Clark University, gives the results of an examination of 60 juvenile delinquents. There were two groups, comprising 26 boys with an average age of 16 years. They were selected by the authorities of the institution as specimens of the following classes of offenders: Thieves, incendiaries, assaulters, sexual offenders, and general incorrigibles.

In the following tables, 24, 25, 26, 27, and 28, are given the results of Dawson's investigation.

INTERPRETATION OF DEGENERACY.

Dawson believes that the foregoing study of delinquent children has demonstrated a general deviation from the physically and intellectually normal type. A deviation from the morally normal type has, of course, under the circumstances, been assumed. The salient points of inferiority may be finally summarized as follows:

1. There was a tendency to shorter statures, lighter weight, diminished strength in the muscles of the hands, and greater sensitiveness to pain.
2. There was a tendency toward smaller heads, broader heads, and broader faces, the type being, in general, that of lower races or of the infantile period of our own race.
3. There were more physical anomalies than are found among normal persons, mainly in the direction of asymmetrical heads and faces, and deformed palates.
4. There were more defects in sight and hearing, and a greater dullness in the sense of touch, than are found among normal persons.
5. The intellectual reactions were, in general, inferior to the normal. More specifically this was the case in attention, memory, and association.

CONCLUSION.

In concluding, Dawson thinks that the degeneracy found in these delinquent children must be interpreted mainly as the result of two forces: (1) a degenerative process at work in the drunken stock from which the children are descended; and (2) bad surroundings which have developed the process already inherited. Dawson says: "Their parents have undergone modification in the direction of a less perfect physical structure and less highly developed physical powers. They have deviated, morbidly, from the type of their race and civilization."

THE FIRST FIVE HUNDRED DAYS OF A CHILD'S LIFE.[1]

The child whose history is here recorded was born of American parents while residing in Zurich, Switzerland. The father's ancestry is purely American, while the mother's is purely English. On the paternal side the families were agricultural, on the maternal mechanical. The grandparents were of good health. The parents are physically strong and of sanguine temperament; both had university education, and were teachers before and after marriage.

The child at birth was physically strong. His mother was his only nurse and constant companion. During the first sixteen months she was not absent from him more than half a dozen times during his waking hours. All the observations were made by his mother, Mrs. Winfield S. Hall. All the measurements were taken by his father, Dr. Winfield S. Hall.

Table 29 gives a list of twenty-five measurements. The observations were made at the end of each month during the first year.

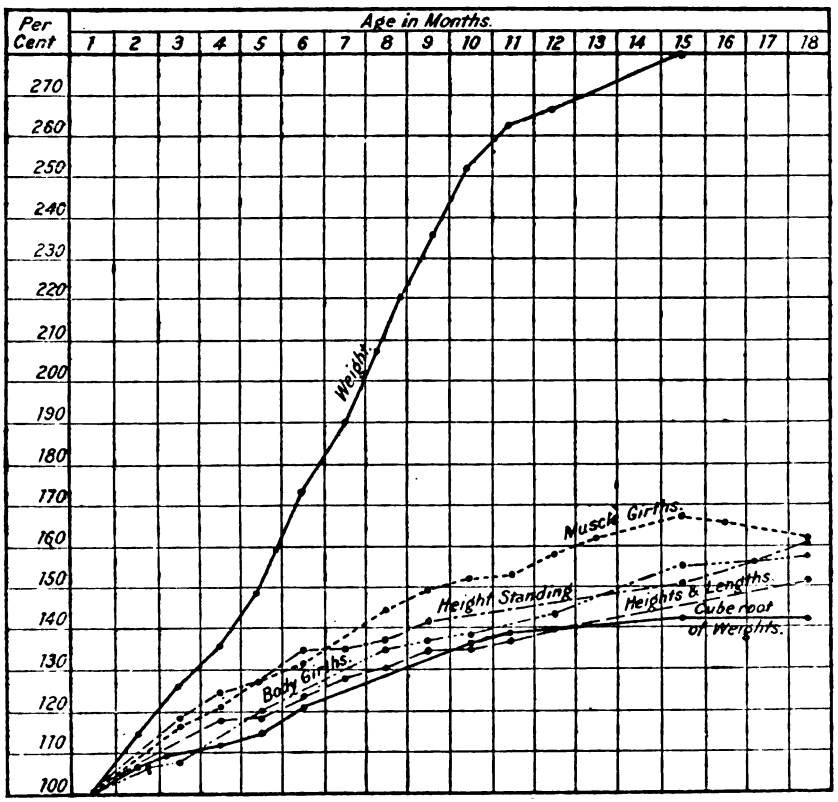
LAWS OF GROWTH.

1. The wave theory of growth, already demonstrated for children and youths of school age, is well illustrated in the course of any curve on the plate. The curve for muscle girths, for example, presents crests, at 3, 5, 8, and 15 months, and indicates periods of accelerated growth from the first to third month, fourth to fifth month, sixth to eighth month, and eleventh to fifteenth month; and periods of retarded growth, from third to fourth month, fifth to sixth month, eighth to eleventh month, and fifteenth to eighteenth month, or four periods of accelerated growth, followed by a like number of periods of retarded growth.

Showing course of increase in lengths, girths, and weights.



All the other curves show waves, though in a less marked degree than in the one just cited.

2. To test the relations of vertical to lateral dimensions—as cited above, under "a law of proportion of the human body"—is the principal purpose of this investigation.

Of the six curves traced, two represent vertical dimensions, heights and lengths, and heights standing; two represent lateral dimensions—body girths and muscle girths, while two represent mass—weight and cube root of weight. If the theory of the reciprocal relation of vertical and lateral dimensions is tenable, then we should expect: (1) That related curves will be parallel. (2) That in two reciprocal curves the periods of acceleration in one curve correspond with the periods of retardation in the other.

Digitized by Google

Now, the curves representing height standing and heights and lengths are related curves, because both represent vertical dimensions. If one follows their course from the first to the eighteenth month, one will find that they are remarkably parallel, i. e., that a period of acceleration in one corresponds to a period of acceleration in the other.

Let us inspect the other pair of related curves which represent lateral dimensions, i. e., the curves of muscle girths and of body girths.

Attention has already been called to the fact that the crests of the muscle girth curves occur in the third, fifth, eighth, and fifteenth months. Inspection of the body girths curve shows that its crests occur in the second, fifth, eighth, and fifteenth months. The slight discrepancy is of less moment than the lack of parallelism between the curves between fifteenth and eighteenth months. One curve shows a marked retardation of the rate of increase of the muscle girths, while the other shows only a slight retardation of the rate of increase of body girths. But this difference is easily accounted for. Between the fifteenth and eighteenth months the child suffered from a moderately severe attack of whooping cough. There was no increase in weight during these three months, but there was considerable increase in height and lengths. This combination must be accompanied by a decrease in girths. Now, a decrease in girth of arm or leg would signify a consumption of reserve fat, while a decrease of chest and abdomen measurements might signify a decrease in the rate of growth, or even of the nutrition and efficiency of the vital organs lodged in the body cavities. One would expect that if the girths must decrease, the muscle girths would be first to suffer. The chart shows that such is the case, and the loss of weight through consumption of fat from arms and legs, was compensated by the increase in the length of arms and legs. We are more than justified in affirming the conclusion that related curves are parallel, or we may formulate the following laws of growth:

(*a*) The vertebral column and all of the long bones of the body are subjected to simultaneous accelerations and retardations of growth.

(*b*) The girths of the body and of the arms and legs are subjected to simultaneous acceleration and retardation of growth.

(*c*) The acceleration and retardation of growth are more sharply accentuated in the muscle girths than in the body girths.

Let us now examine the tenableness of the second *a priori* proposition, that "in two reciprocal curves the periods of acceleration in one curve correspond with the periods of retardation in the other." Any curve representing vertical dimensions is reciprocal to any curve representing lateral dimensions. One may make four combinations of reciprocal curves: (1) Muscle girth is reciprocal to height standing, and (2) to heights and lengths; (3) body girths is reciprocal to height standing, and (4) to heights and lengths. The proportion may be most concisely and effectually tested by tabulating the position of the crests of the waves of growth:

Location of crests of reciprocal curves.

	Months.							
Muscle girths	3		5		8		15	
Height standing		4		7		9		18
Body girths	2		5		8		15	
Heights and lengths		4		7		9		18

The scarcely noticeable crest at the twelfth month in height standing and in related curve, heights and lengths, may be omitted from the table, though its presence is rather confirmatory. This table, according to Hall, demonstrates beyond a reasonable doubt that in any pair of reciprocal curves the crests of one alternate in time with the crests of the other; or that the periods of accelerated growth in one

Digitized by Google

dimension of the body alternate with periods of accelerated growth in the other dimensions. To the laws of growth formulated above we may add the following:

(*d*) When the vertebral column and all of the long bones of the body are undergoing an acceleration of their rate of growth, the body girths and muscle girths are undergoing a retardation of their rate of growth.

(*e*) Conversely, when the lateral dimensions of the body are undergoing an acceleration, the vertical dimension undergoes a retardation of its rate of growth.

But what is the relation of weight (rather the cube root of weight) to these linear dimensions? It is evident that the weight can not vary with the vertical dimension of a body when the lateral dimensions are varying at a rate different from that of the vertical dimension, though in the same direction. The weight of a body of varying dimensions varies as the product of the dimensions. In a graphic representation the curve of the cube root of the weight would be parallel to a curve representing the mean between reciprocal curves. If, for example, one traces a curve which is mean between muscle girths and height standing, this curve will represent the product of the lateral by the vertical dimensions. This curve presents a remarkable parallelism to the curve representing the cube root of the weight.

To the laws of growth formulated above we may add:

(*f*) The weight varies as the product of the vertical and lateral dimensions.

(*g*) The curve representing weight presents less marked waves than do the curves representing vertical or lateral dimensions.

SENSES.

The perception of light is the first step in the development of the sense of sight.

The perception of the light reflected from bright-colored objects is the second step in the development of sight.

The gradual development of the power of directing the eyes upon objects (fixation) indicates the course of the development of the visual perception of objects, because fixation of the eyes is, in all animals capable of binocular vision, accomplished by an associated coordination of the voluntary muscles which direct the eyes and of the involuntary ciliary muscles which cause the focussing of the rays of light upon the retina. The coordination just cited is inherent; there is therefore no reasonable doubt that the formation of a clear image of an object upon the retina is coincident with the convergence of the eyes upon the object. The physical perception of objects can not precede the formation of their image upon the retina—i. e. can not precede fixation of the eyes upon objects

The time when visual perception becomes relatively clear precedes the following of moving objects by the eyes, because this act is a voluntary one, and the child can not will to follow the motions of an object which it does not perceive.

Having established these two propositions, visual perception can not precede fixation; visual perception must precede the following of moving objects by the eyes, it remains only to establish the dates when these two things were observed, and we shall have the limits between which visual perceptions of objects developed.

Fixation is definitely observed first on the twenty-eighth day.

Voluntarily following a moving object was first noted on the thirty-second day.

Therefore, in this child, a clear visual perception of objects was established in the fifth week.

The differentiation and recognition of form begins earlier and develops much more rapidly than the differentiation and recognition of color.

Sensitiveness to vibrations of the air was manifested on the first day.

Differentiation of the character of sounds, whether agreeable or otherwise, precedes the recognition of sounds.

The attention is held much more closely when two senses are affected than when only one is affected.

EMOTIONS.

Fear and anger, the animal emotions, were very early exhibited.

Affection and sympathy, the higher emotions, were much later developed.

Compassion, one of the highest emotions, did not appear until near the close of the five hundred days.

ns, did not appear until near the close of

Fear being in every case allayed or dispelled, came to be seldom exhibited.

Outbursts of anger, being in no case allowed to avail anything, were very infrequent.

Sympathy and affection, being always encouraged, grew rapidly and became habitual.

There is a striking correspondence, in order of events and coincidence of time, between observations in Preyer's child and this child, given in the following table:

TABLE 31.

Observations.	Baby Preyer.		Baby Hall.	
	Week.	Day.	Week.	Day.

The child licks his image	61	.....	61	420
The child makes grimaces as he looks into the mirror	67	.....	62	428

INTELLECT.

In Baby Hall the powers of the intellect appeared in the following order: Attention (32), memory (34), volition (52), somatic consciousness (69), persistence (119), imitation (220), representative imitation (283), egoism proper (254), reason (287), active imagination (427).

Attention, memory, volition, and somatic consciousness, the powers which are shared by the lower animals, were first developed.

Persistence, imitation, egoism proper, and representative imagination, which are shared by the higher animals, were not developed.

Active imagination and reason, the essentially human powers, were last developed.

In the child's relations with the mirror he first simply looked at his reflection, as birds do. He next showed fear of it, as do many of the higher animals. He then grasped at it with his hands, as cats strike at reflections with the paw. Later he looked behind the glass to find the object, as cats and monkeys have been known to do. But on the four hundred and twentieth day he deliberately turned the glass at different angles to obtain required reflections, an intelligence not possessed by any animal other than man.

A definite idea of number, as far as two, had been developed by the sixty-ninth week.

CONCLUSIONS AS TO LANGUAGE.

The first language of the child was the primitive language of the species and consisted of sounds and signs. This language expressed elementary physical needs, and the lower order of psychical states—emotions. Every expression of this language would be perfectly understood by every adult member of the species.

The second language of the child—that of the first three months of articulate speech (two hundred and twenty-third day to three hundred and fourteenth day)—was an interjectional, onomatopoetic race-language. Of the vocabulary of this language, 83 per cent consisted of words having duplicated syllables, 33 per cent consisted of interjections, and 33 per cent of onomatopoetic words. With the exception of the word "kitty," acquired on the last day of the period, the whole vocabulary would probably be intelligible, when used by a child, to any adult member of the teutonic branch of the race.

The third language of the child was the vernacular language of the mother. The vowel sounds were introduced in the following order: i, ōō, ä, ĭ, ē, ŏ, ōō, ă, o, ā, á, ĕ, oi, ow, ū. The consonant sounds were introduced in the following order: b, p, t, k, sh, g, d, m, s, z, n, y, r, f, ch, l, ng, w, j. The consonant sounds not used were: v, th, (asp.), th (voc.), wh, and zh.

During the eighth, ninth, tenth, and eleventh months there were more vowels than consonants in use. During the twelfth and thirteenth months there were as many consonants as vowels in use. During the remaining time the consonants were more numerous than the vowels.

As to frequency of use in new syllables the vowels take the following order: ē, ĭ, ă, o, ū, ī, ōō, ä, á, ā, ĕ, ŏ, a, ōŏ, oi, ū.

As to frequency of use in new syllables the consonants take the following order: b, n, t, k, p, m, w, d, v, f, s, sh, h, g, ng, z, r, l, ch, j.

CHILDREN'S PURPOSES.

In order to learn something of children's interests in plants, Katherine A. Chandler,[1] of Leland Stanford, jr., University, California, sent out the following test to several public schools: "John's father gave him a piece of ground for a garden, and said he might plant three plants. Guess what he planted. Why?"

The answers returned show clearly the children's motives in planting, and are considered from that standpoint. There were received from the boys 232 papers, and from the girls 260 papers, the authors all ranging in ages from 8 to 15 years. The papers came from both city and farming districts.

The papers were collected under two main heads, "materialistic" and "æsthetic" according to the children's purposes in planting. Materialistic included all food products; æsthetic included plants esteemed for their flowers. The term garden may have increased the "materialists" among the country children, suggesting spring preparation for vegetables.

The boys show a strongly increasing idea of the value of material things, 50 per cent at 8 years becoming 75 per cent at 15.

The girls show less interest in material things, 46 per cent at 8 years reaching 56 per cent at 15, due perhaps to the fact that boys are given to understand that they must earn their living, making them more on the lookout for the value of things.

Æsthetic purposes are just the reverse of materialistic. While 50 per cent of the boys at 8 plant for the sake of flowers, only 25 per cent at 15 express a desire for the beautiful. At all ages, the girls are stronger in admiring the æsthetic; 54 per cent at 8 years decreasing only to 44 per cent at 15.

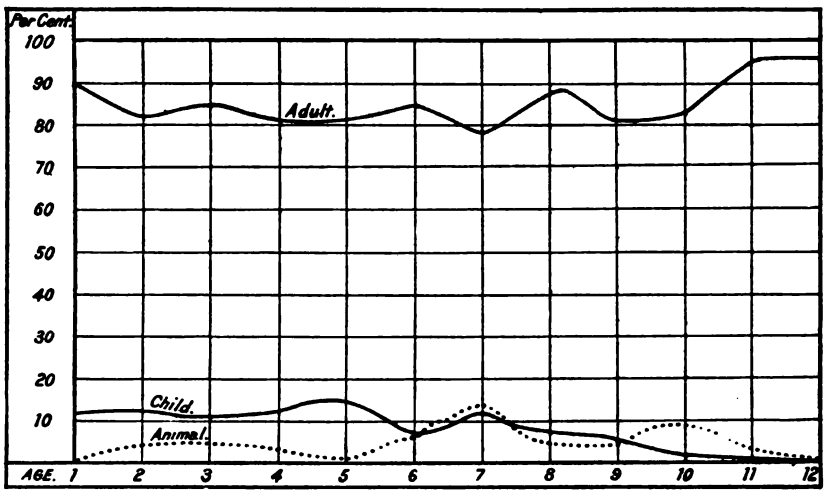
Imitation in Children.

By working over the results of E. H. Russell's book on imitation, Caroline Frear[1] gives results showing the trends and age tendencies in imitation by children. The following chart shows whom the child imitates:



There is a small per cent of imitation of things, as an engine. As will be seen, imitation of adults is much in excess of imitation of other children or animals. The imitation of adults increases with years. In another chart Miss Frear shows three kinds of imitative activity: Direct, playing, and imitation with an anxious purpose. Direct imitating is more immediate, is impulsive. Playing imitation is dramatic, like playing horse; it increases with age, while direct imitation decreases.

In another chart is shown with whom the child plays. The tendency to play with the adult is noteworthy during the first year, after which for two or three years he is satisfied to play with himself. Then this decreases, and play with other children increases rapidly as the social instinct develops. In other charts it is shown what children imitate, as action, speech, or sound. The preponderance of imitation of action over that of speech is shown in early years. Speech develops in connection with action.

Blushing.

The following data as to blushing are given by G. E. Partridge,[1] of Clark University. A syllabus sent out by Dr. Hall had, among other questions, these:

How do you know you are going to blush? Where is it first felt? Do you feel it in hands, arms, limbs, neck, chest?

Are there attendant tweaks, tingles, twinges, or other sensations elsewhere, or any reactions of pallor or chill?

Describe spontaneous flashes in any part of the body as when alone.

Teasing to make others blush.

Describe your own blushing habits and those of your friends.

The results upon which the study is based came from the State Normal School at Trenton, N. J.

Blushing is distinguished from flushing; blushing is use for the phenomenon as observed in others. There are 120 cases (36 males, 84 females) of blushing. The age is given in 60 cases: 2, six years; 2, nine; 4, ten; 5, eleven; 8, twelve; 2, thirteen; 2, fourteen; 11, fifteen; 8, sixteen; 7, seventeen; 8, eighteen; 3, nineteen.

[1]The Ped. Seminary, April, 1897.

Digitized by Google

There appears to be no uniformity in manner of blushing; in some it appears in a small spot and spreads in all directions, or spreads upward only; in some downward, appearing on the neck last.

The causes of blushing were teasing (usually about the other sex), 32; told to blush, or not to, or told that they are blushing, 18; reciting, 13; spoken to, 8; looked at, 6; a certain name mentioned, 5; talking, 4; mistake, 4, etc.

The frequency in which the mention of a blush produces it is to be noted. The fear of being seen blushing increases it, hence one does not blush so readily in the dark.

Flushing was felt in 134 cases, all but four or five of which are of females ranging in age from 17 to 22 years.

The most important warnings and preliminary symptoms of a flush are: Tremors, a "feeling" near the waist; weak in the limbs; tremor which passes from the feet to the head; a feeling, swelling, pressure, trembling, warmth, a weight, beating in the chest, warm wave from feet upward; heart seems to stop, then beats more rapidly; quivering of the heart; blood rushes upward; hot glow all over; nervous flush or feeling; cold all over, then very warm; feel uncomfortable; dizzy; "quickening" of blood all over the body; tingling in toes and fingers; something rises in the throat; eyes smart; ringing in the ears; face prickles; pressure inside the head.

Symptoms most physical were self-consciousness; "feeling as if being looked at;" "feel foolish;" "confused;" "feel as if I were going to blush."

There is more in a blush than a mere hyperæmia of the surface; there is a disturbance of the vaso-motor functions and emotions.

In flushing, the feelings, flashes, and tremors pass upward, but in blushing the actual redness has no definite course of spreading. Paget, a distinguished gynecologist, in making notes for Darwin in regard to the extent of blushing, showed that actual redness is confined to face and neck, occasionally appearing in the hands.

As to diffused waves and flashes, an increased flow of blood to the brain is accompanied by arterial contraction in other parts of the body; then, as the blush subsides, there is a redistribution of blood in the surface of other parts of the body, with tingling, prickling, and often sweating.

In regard to reactions, chill is mentioned 27 times; prespiration, 8; weakness, 8; pallor, 7; headache, 3, etc.

Campbell thinks that nine-tenths of all blushes are from a feeling of shyness, and that they are unnatural and morbid. But an infant does not blush; he may turn red from anger or other causes. It is not until the age of 3 or 4 that children begin to blush; still, children much younger than 3 exhibit shyness. Most evidence seems to show that fear underlies most of blushing; the presence of the feeling of dread, the palpitation of the heart, the impulse to escape or to hide, and the shock tend to confirm this view.

Blushing increases at puberty; it is much more common among girls than boys; with women than men, and remains to a greater age in women, as Darwin has shown. Blushing seems to be a relic of ancestral sex fear.

A Study of Fears.

This study of fears, by President G. Stanley Hall,[1] is based upon the returns in answer to the following syllabus:

SYLLABUS.

1. Fears of celestial phenomena, as, e. g., of winds, storms, thunder and lightning, heavenly bodies, meteors, sky falling, cloud, mist, fog, and cloud forms; end of the world and attendant phenomena; night and darkness, eclipse; moon breaking; that the sun may not rise; peculiar sky colors, northern lights, excessive heat and cold, loss of orientation and points of compass.
2. Special inanimate objects, as fire and conflagration; water, drowning, and washing or being washed; punishment and its instruments, and things and places associated with it; falling and of high places; uncanny places, as caves, ravines, gorges,

[1] A study of fears, reprinted from the American Journal of Psychology, Vol. VIII, No. 2.

Digitized by Google

forest gloom, high hills and solitude generally, and getting lost or shut up; guns and weapons; points, sharp edges, very narrow or wide open spaces; dirt on garments or skin, and contact generally; vehicles and riding.

3. Living things, self-moving things generally; big eyes, mouth, teeth; dog, cat, snakes, pigs, rats and mice, spiders, bugs and beetles, toads, etc.; sight of blood, robbers and burglars, strangers, society and bashfulness; fear of being laughed at, talked of, or being ridiculous; shyness of opposite sex; fear of fighting; cowardice, poltroonery, suspiciousness.

4. Disease, dying, death; loss of friends, position, fortune, beauty, or of health generally; heart disease, cancers, fits, consumption, starvation, fear of prevalent diseases, or of those read of.

5. Fears of the supernatural, e. g., ghosts, spirits, witches, fairies, dragons, or mythological monsters; dream fears, conscience fears, as of having committed unpardonable sins; punishments specially incurred or sent from heaven, loss of soul and next-world fears generally, fears of sin or impurity.

6. Describe any sudden experience you have felt or observed, and whether involving only distinct surprise or being intense enough to cause real shock, start, or astonishment, with details of cause, effects, and their permanence; terrors, without danger or cause other than an hereditary or a traumatic disposition to timidity.

7. In each case state order and age of fears, how long they lasted, how intense they were, what acts they prompted, and educational good or bad effects; was sleep affected? State specific symptoms, starting, paleness or sweat, urinations, rigidity, cramps, horripilations and "creepy, crawling" feelings, nausea, weakness, fainting, flight; causes, treatment, and cures.

This syllabus is drawn up by the undersigned, and is sent to you with the request that you will read it carefully item by item, and (1) jot down at once in the easiest form of notes whatever each paragraph or phrase recalls of your own childish fears; (2) that if you are a parent you will add to this any observations this paper may suggest or recall on your own children (it may aid you if you keep a "life book" or memoranda in any form about them); (3) that if you are a teacher, you will read this paper to your class, write it on the board, or give it to individual pupils (of upper grammar or high school grades) and ask them to write as an exercise in composition (setting apart an hour, or asking for out-of-school work) an account of their own early or present fears; (4) if you are a normal-school principal or teacher of psychology, you may connect it with the class work in the study of feelings or emotions; (5) if you are a principal or superintendent, you can assign the work to some teacher or advanced pupil to collect the data. All returns may be anonymous if preferred, but age, sex, and nationality must be stated in every case.

Returns may be sent direct to the undersigned, or, if preferred, may be studied by you, and will make the best of material for a lesson in psychology, for a discussion in a meeting of teachers or mothers, or an address, or an article for the press. When you are entirely done with the material thus gathered and used, send it to the undersigned.

G. STANLEY HALL.

The data for the first tabulation consisted of the records of the chief fears of 1,701 people, mostly under 23 years of age, gathered in different places, and 386 supplementary reports.

The 1,701 persons described 6,456 fears, which are grouped as follows, according to the objects feared:

Digitized by Google

The following fears show decline with advancing maturity in both sexes: Meteors, clouds, blood, end of world, being kidnaped, fairies, loss of orientation, shyness of strangers; but the following fears seem to increase: Thunder and lightning, reptiles, robbers, self-consciousness, machinery.

While many special fears decline and others increase with age, many infantile fears remain through life.

Class Punishment.

As a test of children's ideas of class punishment, the following story was given under direction of Caroline Frear[1] to 1,914 children: "One day the teacher left the room and while she was gone several children in the room began to make a noise. The teacher heard the noise as she was coming back, but did not know which children were out of order, and none of the class would tell her. So she kept the whole class after school. Was the punishment just or unjust, and why?" There were 968 boys and 946 girls ranging in age from 7 to 16 years. Each age for each sex was collected separately. The papers were collected under the headings "just" and "unjust", and subheadings for the reasons why just or unjust.

Eighty-two per cent of all the children considered the punishment just, 17 per cent unjust, and 1 per cent gave qualified answers.

The per cent of those regarding the punishment just decreases very slightly with age, as the following chart shows. The per cent of those regarding it unjust increases very slightly, but through all ages the proportion of those regarding it just exceeds the others very much.

The following figures show the age tendency in groupings:

	7 to 9 years.	10 to 12 years.	13 to 16 years.
	Per cent.	*Per cent.*	*Per cent.*
Just	88	83	79
Unjust	12	17	21

This may show tendencies, decreasing with age, on the part of children to accept as just their accustomed experience.

The per cents for the reasons under "just" are made out on the number of "just" papers, not on the whole number of papers, and the same is true for the reasons under "unjust."

Forty-seven of those who considered the punishment just gave as the reason that the class would not tell or ought to tell who the guilty were. The statement "ought to tell" increases with years.

The table which follows shows the relative appealing power, with the reasons given, for the justice of the punishment powers at different years. Age tendencies are noticeable.

Table 39.—*Reasons for justice of punishment.*

	7 to 9 years.	10 to 12 years.	13 to 16 years.
	Per cent.	*Per cent.*	*Per cent.*
Class wouldn't, or ought to, tell	39	50	50
Guilty should confess	2	4	7

Following are the conclusions:

(*a*) Children accept in early years arbitrary punishment enforced by authority. They submit to such punishment less readily as age increases.

(*b*) Children have an increasing sense of their value as individuals, and increasingly demand the protection of their individual rights.

(*c*) At the same time they have an increasing sense of social responsibility in the honest exposure of guilt.

The above conclusions seem to justify the following pedagogical application: Class punishment should be used less with older than with younger children. Its use, even with younger children, is questionable, since a considerable number of these react strongly against it.

The following additional conclusions bear on the general subject of punishment, and confirm what other studies have already asserted:

In early years the sense of justice is based on feeling and on faith in authority. As age increases it is based on reason and understanding.

Young children regard punishment as a means of balancing accounts with the offense. Its purpose as a social protective measure—a preventive of further trouble—is understood better as age increases.

Moral Education.

In order to study moral education from the side of introspection, a syllabus of twelve sections was sent out by President G. Stanley Hall. The returns from this syllabus have been worked out and presented by J. R. Street,[1] fellow in Clark University. The replies to the first five sections were of such a nature that only general results are given.

QUESTIONS.

1. What punishments or rewards have you ever had that did you good or harm? State the case and its results.

Of the 183 persons reporting 104 give instances of punishment, 66 speak of being benefited and 38 as being injured by the punishment.

Conscience cases.

SEC. III. State a few conscience cases in yourself or others, describing the circumstances that helped or confused them.

The following cases were presented:

Studying on Sunday, 7; dancing, 4; working on Sunday, 3; reading fiction on Sunday, 3; card playing, 2; theater going, 2; Sunday excursions, 2; waltzing with young men, 2; plagiarism, 2; Christian activity, 1; Sunday traveling, 1; betting, 1; confession of misdeeds, 1; boating on Sunday, 1; party going, 1; alcoholic drinking, 1; attending social entertainments, 1.

There was nothing to show that conscience plays any great factor in life before the age of 9, and very little mention was made of it before 13. The cases, however, are altogether too few to make any generalized conclusion concerning the age at which conscience becomes a potent element in the individual, yet it may be premised that it does not reveal its existence at as early an age as many would believe. The writer knows a child in whom it was abnormally developed at the age of 3. Impulse governs most of the activities of early childhood.

Direct moral education.

SEC. IV. What has been the effect on yourself or others of direct moral inculcation, whether at home in the form of a plain talk, a good dressing down, or advice not sought, or preaching in and out of the pulpit, and school or college instruction in morals? What book, system, or idea in each have been morally helpful?

The returns are filled with such statements as "Preaching or advice unsought has never done me good; suggestion has."

* * * * * * *

The boys were almost unanimous in commending the effects of a good plain talk, and none had a word to say against a good dressing down. Many spoke very gratefully for having had punishment in due season. It does seem that there comes a period in the existence of many a youth when he conceives the idea that he is lord of creation and his future usefulness as a member of society depends upon the thorough eradication of this disease of his system by the faithful and energetic administration of birch tonic.

Direct religious inculcation.

SEC. V. What has been the effect of direct religious inculcation and what changes of religious views have affected your moral conduct, your conscience, and sense of right? Have liberalizing theological opinions made you better or worse, and how?

Sixty-eight returns were received to this section.

* * * * * * *

Of those reporting, 50 say they were benefited by direct religious inculcation, 5 that they were injured, while 3 say they were affected in no way; 10 mentioned example with some precept.

Proper books seem to play an important function in religious education.

Very few mentioned liberalizing theological opinions (8), and they put an interpretation on these words that is not usual. The returns clearly point to the important duty of parents and friends to give proper religious instruction at a very early age.

Influence of teacher.

SEC. VI. Reflect which teacher or teachers from kindergarten to college, or professional school, or in Sunday school you have liked best and been influenced most by, and then try to state wherein the influence was felt. What qualities impressed you most, and how? i. e., account, if you can, for the exceptional influence of that particular teacher. Was it generally felt, or peculiar to you and your set? Was it connected with dress, manner, voice, good looks, religious activity or piety, bearing, learning, etc., and how did each salient quality affect you?

This question was answered by 23 boys and 160 girls. As few gave the exact time of the influence, no table can be prepared which might go to show the age at which the young are most susceptible to impressions from the teacher.

An endeavor has also been made to discover whether male teachers exert a greater influence over boys than do female teachers, and vice versa for the girls, but with the exception of the general impression one gets from the returns the attempt has not been fruitful.

From the showing of the table and the testimony of the writers it is safe to conclude that there is an unconscious educative force emanating from the teacher's personality, and so operating upon the pupil as to become a powerful formative agent in the development of his character.

Second. This force, being unconscious in its origin and in its attracting and transforming effect upon the plastic nature of the young, has its origin in what the teacher is rather than in what he says.

Third. It is a significant fact that 149 out of a possible 183 mention the manner of the teacher as exerting such an influence over their natures. It has been said of more than one man—as of the Earl of Chatham—that "everybody felt there was something finer in the man than anything he ever said." It is this very something in the teacher that will go down deeper than his words and either purify or befoul the springs of action in his pupils.

TABLE 40.

Fourth. It is worthy of note that what attracts the pupil is the externals. Voice, dress, good looks, manners, religious activity far overtop the deeper moral elements; but these would be of but little avail did not a teacher possess a personality whereby love, obedience, and respect may be inspired. Teacher's life and actions must harmonize. Example and precept are yokefellows, and children are intensely keen in observing any disparity between them. The teacher's personality determines his worth and moral influence. He who would rule the little child and mold him into pure, noble, useful manhood must himself be a model of virtue. How pertinent is the question, Is not a teacher born rather than made?

Fifth. The difference in the general character of the replies given by the boys from those of the girls suggests one of two things: Either the boys do not possess the power of introspection to the same degree as do girls, or else they seriously suffer by passing the period of early youth wholly under the influence of female teachers. As boys detest effeminate qualities in boys, there can not be in the female teacher as in the male the same inspiration and incitement to develop the manly virtues.

Sixth. Far more powerful than ethical handbooks is moral life.

Influence of companions.

SEC. VII. What playmates, intimate cronies, or friendships have you had that affected your moral nature for good or for bad? Describe concisely each such person physically and psychically. What temperament and what were the qualities that especially influenced you, and how? What is your own temperament?

* * * * * * *

Nearly 200 replies were given to this part of the questionnaire. They furnish some interesting material concerning the manner in which social environment operates.

The good results produced by companionship are: Kindness and sympathy, girls, 32—boys, 6; manners, 30—6; self-control, 20—5; Christian virtues, 20—4; religious influence, 22—1; disposition improved, 15—8; consideration of others, 19—4; sense of truth, 14—3; æsthetic tastes, 15—2; studiousness, 12—2; ambition, 10—2; judiciousness, 9—3; determination to overcome obstacles, 5—4; truer views of life, 6—1; greater love for parents, 3—0.

The evil effects were shown in: General conduct, 15—14; general morals, 20—6; untruthfulness, 15—4; evil thoughts, 12—5; boisterous and rough, 10—4; selfishness, 10—2; disobedient, 5—3; swearing, 4—4; neglectful of duty, 5—2; irreligious, 5—1; slang, 3—3; smoking, 0—4; temper, 2—1; neglectful of home, 2—0; love of dress, 2—0; sarcastic, 1—0; stealing, 1—0.

An interesting table was obtained which went to show that the age at which those external influences are most felt is from 10 to 15 years. The curve reaches its highest point at puberty. The potency of companionship for good or evil is further shown by the fact that only 10 returns refused to acknowledge themselves in any way indebted to their associates for good or evil. It is safe to conclude that social milieu is a moral factor second only to that of the home.

Only 6 girls were influenced by boy companions, 5 for good and 1 for evil. Three boys were affected by girls, 1 for good and 2 for evil. Two girls speak of being influenced for good by making some lads their companions and trying to reform them.

This practice can not be too severely condemned. The wail of many a broken-hearted wife and of social castaways is: "I thought I could reform him." Parents should never be so indiscreet as to permit their sons and daughters to undertake such doubtful tasks. The intense subtility and efficiency of suggestion has been fully shown by Mr. M. H. Small. (See Ped. Sem., Vol. IV, No. 2.)

An effort was made to discover the part played by temperament in these associations, but here the answers were too confused to admit of any satisfactory interpretation; 46 were attracted by persons of the opposite disposition, 43 by similar, 50 gave no clue, and 50 confused the matter.

Ethical relations with parents.

SEC. VIII. What were your ethical relations with your parents? What kind of personal influence emanated from your father and from your mother? What in their example and in their precepts affected you? Give incidents and details.

* * * * * * *

The ethical relations with parents, with two exceptions, were always described as of a pleasant and helpful nature. The intimacy existing between mother and child seemed to be more marked, even among the boys, than that between father and son, or daughter. This, however, is due chiefly to the external business relation of the father, which occupied his time and attention. The following tables show the manner and relation of the parental influence:

Fathers: Christian consistency, 31—0; hatred of falsehood, 22—4; generosity, 19—1; honesty, 15—4; kindness, 12—2; justice, 10—0; forgiving spirit, 9—0; hatred

may conclude that if parents have neither the time nor the disposition to become the companions and guides of their offspring, they can do the child no better service than to encourage him to form a close friendship with some pure soul who is interested in the elevation of humanity.

It is interesting to compare the influence of the preceding four classes. The teacher seems to stimulate the accessories of character, such as manners, sense of social and civil relationships, ambition, tastes, etc. The parent develops the fundamentals, such as sympathy, reverence, love, sense of truth, justice, mercy, kindness, meekness, patience, etc.

Companions develop the social qualities, and afford practical application of the teachings of the home and school, and prepare the boy or girl for the further duties of citizenship by cultivating the sense of independence, individuality, altruism, etc.

The influence exerted by the fourth is rather of an advisory nature. Many of them, however, become ideals to the young, and thus stimulate healthy growth.

In the present constitution of social life these four factors will operate in either a beneficial or injurious manner upon the growing boy and girl. It becomes the parents' therefore, to see, first, that their own life and home are right, then to guard their child from undue contamination from a corrupted milieu. This can be accomplished, not by building a wall around the child, but by erecting a wall within him, which must be razed before the enemy can take possession. In other words, get the child interested in the useful and the beautiful, so that the obscene and degrading will have no attraction for him.

Children have certain inalienable rights which fatherhood and motherhood must recognize. They have a right to stand first in the affections, the interest, and the endeavors of the parent; they have a right to all that is good and noble and encouraging in the parent life; they have a right to find their home the most pleasant spot on earth; they have a right to all the means of refinement that lie within the limits of the parents' purse; they have a right to proper food and clothing for the body, but equally as great a right to mental and moral nourishment, that neither body nor soul may be atrophied; they have a right to have the laws of their development, both physiological and psychical, well understood and held sacred by those in authority over them; they have a right to have their better nature so strengthened that when the seeds of evil speech and evil action fall upon their life they will take no deep and abiding root, because the soil is already occupied by flowers and the fruits of better hopes.

Games.

SEC. X. What games have you preferred and what has been their influence in developing manliness or womanliness, sense of justice and fair play, honesty, perseverance, hardihood, physical strength, and what recreations do you prefer, and why? What is their effect?

* * * * * * *

The following list shows the games played by the girls:

Hide and seek, 56; croquet, 43; tag, 41; tennis, 36; checkers, 23; parchesi, 22; authors, 10; dolls, 18; house, 17; cards 16; baseball, 15; blind man's buff, 15; pigs in clover, 12; prisoner's base, 12; jackstones, 11; jumping rope, 9; halma, 9; dominoes, 9; I spy, 6; chess, 5; duck on the rock, 5; fox and geese, 5; hopscotch, tiddledy winks, 5; school, 5; messenger boy, 4; old maid, 4; euchre, 4; pussy wants a corner, 4; hoop rolling, 3; drop the handkerchief, puzzles, whist, marbles, solitaire, kick the wicket, football, 3 each; anagrams, Antony over, colors, shuttlecock, battledore, basketball, pull away, horse, jackstraws, casino, seesaw, mumblety peg, bluebird, ambassadors, robbers, lotto, black bear. 2 each; beanbag, fish pond, twenty questions, hearts, color of the bird, come to supper, dog on wood, crack the whip, charades, sense steps, hide the thimble, puzzle fifteen, kick the can, red soldier cap, cribbage, bowling, London bridge is falling down, Jacob and Rachel, hare and hounds, my ship's arrived, bright idea, spider and the fly, Louisa, wild horse, golden pavement, consequences, snap, hunt the slipper, kick the stick, geography cards, dice, Peter Coddle's dinner party, putting together our country, princess and captain, tenpins, gymnasium, cars, cross and wood, can can, old witch, running on cans, walking on stilts, backgammon, crisscross, here we go round the mulberry tree, tollgate, giants, Copenhagen, needle's eye, word making, catch, jack-a-bow, innocence abroad, go bang, mother goose, catch fish, circus, church, babmintor, Indians, and guessing games.

Games by the boys are: Baseball, 14; football, 9; checkers, 8; cards, 7; tennis, 6; marbles, 4; tag, 4; croquet, 4; bowling, 3; hide and seek, 3; dominoes, 2; pool, 2; tiger, 1; blind man's buff, jumping rope, little old man, mossy, shinny, hide the thimble, forfeits, parchesi, chess, tit-tat-toe, quoits, billiards.

In regard to the moral import of games, the following classification shows the way they are viewed by the boys and girls:

Womanliness.—Dolls, 17; house, 12; school, 3.

Digitized by Google

Manliness.—Ball, 12 (football 6, baseball 6); tennis, 1; cricket, 1.

Mental power.—Authors, 5; checkers, 3; music, 2; chess, 1; cards, 1; parchesi, 1; charades, 1; ball, 1; my ship's come home, 1; anagrams, 1; putting our country together, 1.

Perseverance.—Pigs in clover, 9; parchesi, 9; tennis, 9; checkers, 8; ball, 8; croquet, 5; halma, 5; cards, 5; puzzles, 5; hide and seek, 5; I spy, 2; authors, 2; tag, 2; chess, 2; tiddledy winks, 2; black bear, 1; robber, puss in corner, backgammon, crisscross, anagrams, solitaire, duck on rock, the spider and the fly, messenger force, jacks, 1 each.

Justice and fair play.—Croquet, 22; hide and seek, 18; cards, 14; checkers, 12; ball, 12; authors, 7; tag, 6; parchesi, 6; tennis, 6; halma, 4; blind man's buff, 4; I spy, 3; jacks, 3; prisoner's base, 2; hunt the slipper, black bear, puss in corner, backgammon, crisscross, tollgate, puzzles, bowling, dominoes, hopscotch, ambassodor, bright idea, Indians, tenpins, lotto, chess, innocence abroad, messenger force, quoits, 1 each.

Honesty.—Croquet, 19; hide and seek, 18; cards, 12; checkers, 11; parchesi, 7; ball, 7; authors, 6; blind man's buff, 5; jacks, 5; tennis, 4; I spy, 3; tag, 2; halma, 2; prisoner's base, 2; hunt the slipper, black bear, puss in corner, tollgate, fish pond, seven steps, colors, hopscotch, chess, tiddledy winks, innocence abroad, go bang, 1 each.

Cheating.—Cards, 4; checkers, 1; croquet, 1; dominoes, 1.

The recreations mentioned by the girls are: Walking, 35; rowing, 35; reading, 33; skating, 32; dancing, 31; driving, 25; bicycling, 20; riding, 14; music, 14; swimming, 4; coasting, 3; sailing, 3; talking, 3; rambling in the woods, 3; theater, 2; fancywork, 2; springboard, 1; billiards, 1; tennis, 1; Indian clubs, 1; day dreaming, 1.

By the boys: Bicycling, 7; swimming, 7; skating, 4; riding, 3; gymnastics, 3; fishing, 2; strolling in the woods, 2; walking, 2; reading, 2; rowing, 2; hunting, 1; sailing, 1; driving, 1; music, 1; bowling, 1; dancing, 1.

The reason assigned for the choice of a certain recreation was, in almost every instance, "for physical development."

A number of other reasons, however, were assigned, such as—

Dancing.—Mere pleasure, develops the rhythmic sense, makes one graceful, enlivens the spirits, gives pleasant associations.

Theater going.—Pleasure, mental improvement, develops the sympathetic side.

Music.—Brings rest and makes one more cheerful, stirs one's deeper nature, produces a feeling of sublimity, develops the æsthetic side.

Fishing.—Develops patience and perseverance.

Bowling.—Produces physical strength and control of muscular power.

Bicycling.—For physical development, gives a sense of freedom and of independence, a great brightener of spirits. The motion is fascinating, pleasure, power to travel.

Rowing.—Physical strength, restful.

Skating.—Physical development, sense of freedom, hardihood, produces a better mood.

Bathing.—Pleasure.

Reading.—Takes my attention from my studies, develops sympathy, improves the mind, corrects one's views of life, pleasure; one said: "makes me unsociable and selfish."

Riding.—Physical health, restful, brings one into contact with nature, revives drooping spirits.

Walking.—Health, communion with nature, spiritual uplift, produces a better mood, pleasure.

It will at once be seen that the great incentive to recreation is the necessity of outdoor exercise for health. The choice, however, is chiefly determined by the pleasure produced. The majority of returns state that they saw no particular moral worth in their pastimes. There is no doubt, however, that even these may be made the means of strengthening the moral sense, and the writers are of the opinion that unconsciously, from those avocations, there has accrued to all those reporting some moral wealth.

The returns give clear evidence in regard to the educative value of plays. By them there is developed justice, moderation, self-control, truthfulness, loyalty, brotherly love, courage, perseverance, resolution, perception, prudence, forbearance, sympathy, a training of hand, eye, limb, and of the faculties of judgment. Provision should be made for a child to express and develop his own inner life through this spontaneous and pleasurable means. All writers on education have recognized the value of play. An article by Mr. Johnson, on "Education by plays and games," is found in the Pedagogical Seminary, Vol. III, No. 1, while President Hall's Story of a Sand Pile is a classic.

Reading, etc.

SEC. XI. What studies, subjects, or lines of reading, or intellectual interest have affected you for good or for bad, and how? Did mathematics deeply impress you with universal law, astronomy with sublimity and reverence, chemistry with the order of the infinitesimal, botany and zoology with the miraculous nature and persistence of life? Have you experienced special interest in any line of study; and if so, can you tell what it is about it that attracts you, and how it has affected you for good? Can you describe or account for any aversion you have felt for any special study?

The following table shows the subjects which seemed to have exerted a good influence upon the student: Psychology, 23; literature, 18; history, 17; geography 5; mathematics, 3; botany, 2; zoology, 2; grammar, 1; drawing, 1; manual training, 2; mechanical drawing, 1; physiology, 1.

The subjects that have had an evil effect are: Manual training, 4; physiology, 2; psychology, 1; literature, 1. Novel reading is also mentioned by 1.

In reply to the question, Did mathematics impress you with natural law? 24 girls and 2 boys answered yes, and 49 girls and 4 boys no.

Did astronomy with sublimity and reverence? Yes, 44 girls, 2 boys; no, 2 girls.

Did chemistry with the order of the infinitesimal? Yes, 17 girls, 1 boy; no, 3 girls.

Did botany and zoology with the miraculous nature and persistence of life? Yes, 70 girls, 5 boys; no, 5 girls.

The subjects in which special interest was taken are: Mathematics, 28; literature, 23; history, 23; psychology, 20; botany, 16; zoology, 11; geography, 10; drawing, 5; grammar, 3; music, 3; physics, 3; poetry, 2; manual training, 2; physiology, 1.

Special aversion was felt for the following subjects, and the reasons assigned were (1) they were poorly taught, (2) the learner had no gift along that line: Manual training, 16; mathematics, 12; grammar, 11; history, 10; geography, 5; latin, 5; algebra, 4; rhetoric, 3; geometry, 1; spelling, 1; physiology, 1; drawing, 1; arithmetic, 1.

GENERAL CONCLUSIONS.

It would be the height of pedantry to build any elaborate system of moral pedagogy on such a limited supply of data. Neither would it be wise to indulge in any metaphysical speculations, as the material is at best one sided. Before any satisfactory conclusions can be drawn a study must be made of persons whose conduct might be designated as moral laxity, a study similar to the one presented by Mr. Geo. Dawson in the Pedagogical Seminary for December, 1896.[2]

Five important facts or principles are clearly suggested by the above material.

First. Moral action in early period of life, and even in early manhood and womanhood, is a matter of imitation and suggestion rather than of intellect. The great rôle played by suggestion has been shown by Mr. M. H. Small.[1]

Second. Though children are born with the sense of the oughtness out of which the moral nature grows, yet this would avail nothing did not parents furnish the growing boy or girl with clear conceptions of the moral content of life, i. e., instruct him or her thoroughly in all the principles that teach duty to God and man.

Third. It is very evident that much of the moral excellence of the character of many of those reporting is due in large measure to the hereditary influence that gathered round them at their birth. Blood does count for something with a vengeance.

The work of Mr. Dawson, above referred to, goes to show that of the 52 moral delinquents personally studied by him the most of them "had parents that were intemperate, improvident, or criminal." When bad environment had joined hands with this bad heredity nothing short of a miracle could stay the influences that were driving these same boys and girls to the reformatories.

The point is (*a*) "The heredity of the child should be as carefully studied as the strain of the cattle with which the farmer would stock his acres, and any physical weakness or tendency to evil in his ancestry should be made known to him in order that he may be on his guard lest the enemy that lurks in ambuscade in his very veins may attack him unawares; (*b*) The forces of environment should be so controlled as to destroy as far as possible any hereditary taint and at the same time strengthen and develop any predispositions to moral rectitude and manliness of life."

Fourth. The supreme aim of the parent and the teacher should be to establish definite, strong, correct habits. True morality consists as much in doing as in being. Habits are the induced states of mind or body by means of which the latent power is transformed into an effective process, and becomes active rather than passive.

Their importance is recognized in the mechanical world. The intellectual and moral spheres have indeed been slow to acknowledge their worth. Manual habits enable the mechanic to produce the finished article; moral habits the boy or girl to maintain a blameless character under every circumstance of life. Sound knowledge of moral truth is good, but sound habits of moral action are better.

It is perhaps universally true that parents have devoted themselves assiduously to the instruction of their sons and daughters rather than to the establishment of habits. The natural and most effective means has thus been neglected.

Fifth. The last stage is the purification of the child's taste. All children are born with impulses and desires which are capable of unlimited education. In the early years of youth they are the controlling factors of the child. Intelligence and conscience assert their sway later. Not only are there natural tastes, but there are acquired ones. The latter are much more numerous, and are the direct production of environment. According as one's tastes are pure and noble so will be the life. Much can be done to surround the growing soul with such influences as will make for strong, vigorous, noble manhood or womanhood.

Sixth. For the evolution of the ethical consciousness nothing is perhaps better than the arousing of the religious sentiments.

Seventh. He who would lead must walk in the way himself.

Eighth. Love and faith are worth more than knowledge or specific forms of government.

Eye Defects in Students and Children.

Professor Swift,[1] of State Normal School of Stevens Point, Wis., gives the condition of eyes in young people engaged in study. The tests were made by Dr. Alcorn. They were (1) the ordinary tests of each eye for vision; (2) the card test for astigmatism; (3) the Maddox multiple rod test for muscle trouble; and (4) the diagnosing errors of refraction by means of the ophthalmoscope. The one undergoing examination was 20 feet from the test chart. The type used was Hermann Snellen's. The type which a normal eye should read at a distance of 20 feet was 9 millimeters square. This represents normal vision and is designated by twenty-twentieths. Over 300 of different ages were examined.

Table 41 shows that the percentage of pupils with normal vision in both eyes is much greater in the grammar grades than in the normal department. There seems to be a steady decrease in the acuteness of vision of pupils from the lower grades to the higher. About 50 per cent of the pupils have at least one eye whose vision is not normal.

Table 41.

Vision.	Normal department.	Grammar department.	Intermediate and primary department.
	Per cent.	*Per cent.*	*Per cent.*
Twenty-twentieths or better	14.39	21.42	19.04
Twenty-thirtieths or better, but not so good as twenty-twentieths	51.75	54.76	57.14
Twenty-fortieths or better, but not so good as twenty-thirtieths	12.06	9.52	14.28
Twenty-sixtieths or better, but not so good as twenty-fortieths	7.78	9.52	2.38
Twenty-eightieths or better, but not so good as twenty-sixtieths	2.72	2.38	0.00
Twenty one-hundred-and-twentieths or better, but not so good as twenty-eightieths	2.72	2.38	4.76
Twenty two-hundredths or better, but not so good as twenty one-hundred-and-twentieths	4.28	0.00	2.38
Below twenty two-hundredths	4.28	0.00	0.00

As a normal eye reads a letter 9 millimeters square at a distance of 20 feet, the twenty-thirtieths type is 13 millimeters square, the twenty-fortieths 18 millimeters, twenty-sixtieths 26 millimeters, twenty-sixtieths 26 millimeters, twenty-eightieths 35 millimeters, twenty one-hundred-and-twentieths 52 millimeters, and twenty two-hundredths 87 millimeters square.

PRACTICAL ASPECTS OF CHILDREN'S INTERESTS.

In order to gain some criterion of the value of educational work by ascertaining the attitude of children toward the different subjects of the curriculum, Dr. Joseph S. Taylor,[1] principal of a public school of New York, had the following four questions submitted to the pupils:

"1. What subject or subjects did you particularly like in your last class?

"2. Why did you take them?

"3. What subject or subjects did you particularly dislike?

"4. Why?"

If it be admitted that a suitable subject properly taught should interest a child, it would seem that where interest is wanting the fault must be either in the course of study or in the teaching, or in both. Such was the point of view of Dr. Taylor in making this investigation.

The number of pupils examined was about 1,000, but only 756 papers were available. The results were tabulated by ages, grades, subjects, and classes. In Tables 42 and 43 are given the results by age and grade.

Two more investigations were undertaken, aggregating with the former study returns from 2,137 pupils. In Tables 44 to 47 are found the results of these studies. No children below the third grade were examined. Table 42 shows an increased interest of the pupils as they advance in age and grade; this is in a boys' school of New York. But in Table 44, representing a mixed school, there is a noted decline of interest, beginning at age 13, for both boys and girls. This seems to be due to the teaching in the fifth grade. In preceding grade 60 per cent of the girls liked arithmetic, here only 20 per cent.

In the following tables the figures at the top represent the ages of the pupils and the grades from which they had been promoted ten weeks before. The next row of figures shows the number of pupils examined in each age and grade. All other figures are percentages, showing what proportion of pupils like or dislike the several subjects of study.

[a] Not reported.

ONLY CHILDREN.[1]

Out of the 1,001 individuals described, 46 were named as "only children," though none of the questions in the syllabus asked about such children. This suggested further questions, and Dr. Bohannon[2] gives the results of a special study of 481 children, based upon answers to the questions in the following syllabus:

Give age, sex, nationality, and describe the temperament, complexion, and general health of the child briefly. Has he brothers and sisters dead? If so, how many? Is he the first born? How long did the others live? Does the child go to school? Regularly? Commenced, at what age? Get along well with other children and in work? How much time does he spend in play? The favorite games? What plays at home? What are the child's best traits? Worst traits? Is he precocious or dull? Has he any mental or physical defects? Name them. What subjects best in? What poorest in? What has been the home and school treatment? What treatment do you recommend?

Age of parents at birth of child. How long had they been married at the birth of child? Are the parents still living? Health, habits, occupations, temperaments,

[1] This refers to instances where there is only one child in each family.

[2] Ped. Seminary, v. 5, No. 4, April, 1898.

Digitized by Google

and position in life. How many brothers and sisters had they? Do they (brothers and sisters) have good health? In so far as above questions apply, describe twins, the only boy, the only girl, and the youngest child in families.

State anything else you may think to be due to the fact that they are the only child, only boy, only girl, the youngest child, or twins.

(Clark University, Worcester, Mass., March 30, 1896.)

Of the children, 381 are only[1] children, 54 are only boys or only girls, 32 are the youngest children, and 12 are twins.

The average age of 134 girls is 12⅛ years, of 86 boys it is 11⅞ years, and for the 292 of both sexes it is 12. 2 years.

Out of 240, 190 were said to be American, 8 German, 5 English, 2 Jewish, 2 Scotch, etc. There were 50 of non-American parentage, 17 of whom are the results of marriages between persons of different nationalities or races.

Those with good health number 162, with fair health 98, and bad health 96.

The temperaments of parents are described as "nervous" in 134 out of 259 cases.

SUMMARY OF POINTS.

These only children are unmistakably below the average in health and vitality.

Mental and physical defects of a grave character are much more common among them than among children generally.

The average length of time between marriages of the parents and births of the children is so great as to suggest a pronounced degree of relative sterility in the stock. This is much more strongly shown in the mothers than in the fathers.

The average age of the parents at the birth of girls is considerably greater than it is at birth of boys.

A greater proportion of the girls than of the boys have only-child mothers, while on the other hand a greater proportion of the boys than of the girls have only-child fathers.

Nervous disorders seem to be unusually common in the families.

These children appear to enter school later than other children, and to be less regular in their attendance.

Their success in school work is below the average.

Not so large a proportion as of other children enter the public school.

They do not join in games so rapidly or often as do other children of corresponding ages. They prefer quieter forms of amusement.

Many of them have imaginary companions.

Very many manifest a decided preference for older associates, while not a few select younger companions, and often from the other sex.

A large number of them do not have as good command of themselves socially as does the average child. Their social relations are therefore more frequently characterized by friction.

Peculiarities in these children seem to be more pronounced than in others.

Precocity appears to be the most prominent trait.

Selfishness is the most frequently named of the worst traits, while affection is most often named among the best traits.

As a rule the home treatment had been that of unthinking indulgence, which generally develops in a child the habit of expecting concessions on all sides, and corresponding unwillingness on his own part to make them to others. A right appreciation of the conditions with which the child must be concerned outside the family life requires that he be given ample opportunity for companionship with children of corresponding ages.

BIBLIOGRAPHY OF CHILD STUDY.[2]

In addition to the titles taken from various works, the bibliography consists of selections from the following bibliographies: Bibliography of Child Study, by Louis N. Wilson; titles relating to the anthropometry of children in a preliminary report on Anthropometry in the United States, by Dr. Edward M. Hartwell; psychological indexes of The Psychological Review; Bibliographie der psycho-physiologischen

[1] This refers to instances where there is only one child in each family.

[2] The author was assisted much in the preparation of this bibliography by his mother, Mrs. Angus MacDonald.

Literatur in "Zeitschrift für Psychologie und Physiologie der Sinnesorgane," and the Index Catalogue of the Library of the Surgeon-General's Office.

There are a few small and special bibliographies given. It was thought best to have these after the special articles to which they refer, and also to preserve the classification made by their authors. (See pp. 1288 and 1315.)

INDEX (OF SUBJECTS AND NAMES) TO CHAPTERS XXI AND XXV.

ABILITY, abnormalities, table, 1087–1088.
— age, colored children, tables, 1051–1052.
—— diagrams, 1048, 1050.
—— Kansas City, 1108.
—— tables, 1047–1052.
— chest girth, 1099.
—— St. Louis, 1098.
— colored children, table, 1043–1052.
— dolichocephaly, 1005–1006.
— estimation of, 1041–1045.
— growth, diagrams, 1027, 1029.
—— Iowa City, 1105.
—— St. Louis, 1096, 1099.
— head circumference, diagrams, 1019–1022.
— height, 1028–1029.
— main branches of study, table, 1043.
— motor, 1291–1294.
— nationality, tables, 1043–1046, 1048.
— pain, table, 1117.
— race, tables, 1043–1052, 1088.
— schóol criterion of, 1041.
— sensibility, table, 1006.
— sex, 1031, 1045.
—— Kansas City, 1108.
—— tables, 1043–1052, 1088.
— sociological condition, 1045.
—— sensibility, 1007–1009.
—— tables, 1008, 1043–1045, 1098.
— standard of, 1042.
— tests of, Iowa City, 1105.
— voluntary motor, 1105.
— weight, 1028–1029.
—— St. Louis, 1096.
ABNORMALITIES, ability, table, 1087–1088.
— age, 1031.
— anthropometry, 935.
— boys, table, 1089.
— children, 1029–1041.
—— colored, table, 1092, 1093.
— girls and age, table, 1089–1090.
— growth, diagrams, 1034–1035.
— head circumference, diagrams, 1032–1033.
— height, diagrams, 1034–1035.
— nationality, table, 1087.
— peculiarities, 1319.
— race, sex, sociological condition, tables, 1087.
— weight, diagrams, 1034–1035.
ACHROMATOMETER (Bloch), 1175.
ÆSTHESIOMETER, 1004, 1158.
— dynamometrical (Verdin), 1160.
AGE, ability, colored children, tables, 1051–1052.
—— diagrams, 1048, 1050.
—— tables, 1047–1052.
AGE, abnormalities, 1031.
— average ability, 1046–1052.
— brightness, Kansas City, 1108.
— estimation of, 1015.
— fears, 1336.
— girls and abnormalities, table, 1089.
— growth, 1129.
— lung capacity, 1121.
— mode of recording, 994.
— punishment, 1337.
ALCORN Dr., 1346.
ALGOMETER (Cattell), 1161.
— (Chéron), 1160.
— temporal, 992, 1155.
AMERICAN parentage, girls, laboring class, statistics, 1070.
ANTHROPOMETER (Topinard), 1187.
ANTHROPOMETRICAL instruments, case, 1190.
ANTHROPOMETRY, aim of, 989, 994, 1122.
— practical nature of, 990, 992, 995.
ARCHIMEDES, plethysmograph, 1151.
ARITHMETIC, ability, colored children, diagrams, tables, 1043–1052.
— faculty for, 1006.
ARM lift, 1104.
— reach, measuring of, 1191–1192.
ARTISTS, first anthropometrists, 989.
ASSOCIATION, attention, apparatus for study, 1200.
AUTOMATOGRAPH (Jastrow), 1163, 1293.
AVERAGE ability, age, nationality, sex, sociological condition, 1046–1052.
AVERAGE boys, all, 1058.
AVERAGE girls, all, table, 1072.
— American and foreign parents, table, 1081.
— American parents, tables, 1077, 1078.
— laboring classes, table, 1077.
— nonlaboring class, table, 1075.
— not socially divided, tables, 1078, 1081.
BARÆSTHESIOMETER (Eulenburg), 1155.
BARNARD Club School of Child Study, 1299.
BARNES, Earl, 1100, 1285, 1303.

CHAPTER XXVI.

REPORT OF THE COMMITTEE OF TWELVE OF THE MODERN LANGUAGE ASSOCIATION OF AMERICA.[1]

The committee appointed two years ago to make recommendations upon the subject of preparatory requirements in French and German has the honor to submit the following report:

SECTION I.—PRELIMINARY.

It will be remembered that the appointment of the committee grew out of a request of the National Educational Association, which has for some time been endeavoring to bring about a better regulation of secondary instruction in the subjects usually required for admission to American colleges. In pursuing this laudable undertaking the National Educational Association very properly saw fit to ask for the advice of various professional bodies, our own among the number. In particular, it was desired that we draw up model preparatory courses in French and German and make recommendations concerning the practical management of these courses. The matter was brought to the attention of both branches of this association at the sessions of 1896, and we were asked to take appropriate action. As the business appeared to be of very great importance, it was thought best to turn it over to a large committee having a somewhat general mandate to investigate and report. The resolution under which the committee was appointed reads as follows:

> That a committee of twelve be appointed: (*a*) To consider the position of the modern languages in secondary education: (*b*) to examine into and make recommendations upon methods of instruction, the training of teachers, and such other questions connected with the teaching of the modern languages in the secondary schools and the colleges as in the judgment of the committee may require consideration.
>
> That this committee shall consist of the present president of the association, Prof. Calvin Thomas, as chairman, and eleven other members of the association, to be named by him.
>
> That the association hereby refers to this committee the request of a committee of the National Educational Association for coöperation in the consideration of the subject of college entrance examinations in French and German.

In pursuance of this resolution the committee was made up early in the year 1897, and began its work by preparing a circular, which was sent out to some 2,500

Digitized by Google

which will be long enough at the best, with a detailed recital of these statistics. Suffice it to say that, taken as a whole, they give us a picture of somewhat chaotic and bewildering conditions. Under various names our secondary schools have a large number of courses in which French and German figure as prominent or as subordinate subjects of instruction; courses of one, two, three, and four or more years; courses providing for two, three, four, or five recitations a week, and for recitation periods ranging from twenty-five to sixty minutes. And when we come to the colleges and higher scientific schools the requirements for admission are hardly less multifarious. Various bachelors' degrees are conferred, and for admission to the courses leading to these degrees French and German figure variously, according as the modern language is offered in addition to the Latin and Greek of the classical preparatory course, or in place of Greek, or as the main linguistic study. Some of the colleges have also an elementary and an advanced requirement, with options variously managed.

Upon surveying the intricate problem thus presented, the members of the committee perceived at once that any report which they might make, if it was to be really useful, must be adapted, so far as practicable, to the conditions as they are. It was not for us to recommend radical changes in the American system, or lack of system, which has grown up in a natural way and must work out its own destiny. It was not for us to attempt to decide which of the various competing courses is the best course, or to antagonize any particular study. Nor could we assume to dictate to the colleges just how much knowledge of French or German, or both, they shall demand for admission to this, that, or the other undergraduate course. The colleges would certainly not consent to any surrender of their liberty to regulate their requirements in their own way. Most important of all, it was not for us to propose any arrangements which could be taken to imply that secondary instruction in French and German exists only for the sake of preparation for college. The great majority of those studying the modern languages in school do not go to college at all. Our secondary education must be recognized as having its own function, its own aims and ideals. In the great mass of the schools those who are preparing for college receive instruction in the same classes with those who are not preparing for college. And this must always be so. These considerations seemed to indicate that the proper line for the committee to pursue was as follows:

To describe a certain number of grades of preparatory instruction, corresponding to courses of different length; to define these grades as clearly as possible in terms of time and work and aim, and to make a few practical recommendations with regard to the management of the instruction—recommendations having as their sole object the educational benefit of the pupil. The members of the committee are naturally of the opinion that the study of a modern language in school has a distinct educational value of its own. The teacher's problem is to realize this value from the study. Whether the learner is going to college or not makes no difference, save as this consideration affects the amount of time he can devote to the modern language while preparing himself in the other necessary subjects. If such courses could be wisely drawn up, and if then they were to be recommended to the country upon the combined authority of the Modern Language Association and the National Educational Association, it would seem reasonable to expect them soon to become the national norm of secondary instruction in the modern languages. It also seems reasonable to expect that the colleges will be not only willing but glad to adopt the practice of stating their requirements in terms of the national grades. Such a mutual understanding between the colleges and the secondary schools should do much to bring a definitely understood order out of our existing chaos.

Having come a year ago to this general conclusion as to what could and should be done, the committee saw that it would be impossible to submit a satisfactory

Digitized by Google

final report at the Philadelphia meeting. There were various matters that required further study. First, there was the question as to how many grades were really needed—whether two, or three, or more. Then there was the question of French and German in the lower school grades. This subject, it is true, had not been expressly committed to us; but it was known that many private schools, and not a few of our best public schools, already provide instruction in French or German in grades below the high school. It was also known that many good teachers strongly advocate this idea. But if it is wise to begin a modern language some time before the high school is reached, and if this practice is to be extended and to become more and more a part of our national system, it is evident that the modern-language work of the secondary schools must be more or less affected. Again, there was the perplexing question of method.

In view of the sharp differences of opinion and of practice known to exist among teachers, the committee thought it best, before undertaking to advise teachers how to teach, to reëxamine the whole matter carefully in the light of experience and in the light of recent contributions to the subject, to the end that their final recommendations might be as free as possible from any vagaries of personal prejudice. Finally, there was the large task of drawing up the proposed courses and formulating the recommendations. Seeing all this work ahead, the committee decided, at the Philadelphia session, to report progress, ask for additional time and money, and, if this request should be granted, to appoint a number of subcommittees, whose task it should be to inquire into and report upon the various questions just enumerated. The request was granted and the committee adjourned after passing unanimously a single resolution, the import of which will be apparent from what was said a little while ago. The resolution was to the effect that secondary instruction in French and German should not be differentiated, according as the pupil is, or is not, preparing for college.

During the first half of the year 1898 the subcommittees worked at their several tasks by means of circulars and correspondence. Early in November a three-day session of the general committee was held in New York City. The meeting was attended by 10 of the 12 members, 2 being unavoidably absent. The reports of the various subcommittees were received and discussed, together with other matters germane to the committee's general task. As a result of the three days' discussion, the substance of the following report was agreed upon. Since the November meeting the report, as below drawn up, has been submitted to the members of the committee, and, after some further interchange of views by mail, has been agreed to by them unanimously.

SECTION II.—VALUE OF THE MODERN LANGUAGES IN SECONDARY EDUCATION.

Aside from the general disciplinary value common to all linguistic and literary studies, the study of French and German in the secondary schools is profitable in three ways: First, as an introduction to the life and literature of France and Germany; secondly, as a preparation for intellectual pursuits that require the ability to read French and German for information; thirdly, as the foundation of an accomplishment that may become useful in business and travel. Under each of these heads a great deal might be said; but an exhaustive discussion of the several topics would swell the volume of this report beyond the limits within which it is likely to be most useful. A few words must therefore suffice.

What we have called the general disciplinary value of linguistic and literary study is well understood the world over, and has long been recognized in the educational arrangements of every civilized nation. The study of a language other than the mother tongue requires the learner to compare and discriminate, thus training the analytic and reflective faculties. The effort to express himself in the unfamiliar idiom, to translate from it into his own, makes him attentive to the

Digitized by Google

meaning of words, gives a new insight into the possible resources of expression, and cultivates precision of thought and statement. Incidentally the memory is strengthened and the power of steady application developed. In time such study opens the gate to a new literature, thus liberalizing the mind and giving an ampler outlook upon life. Through literature the student is made a partaker in the intellectual life of other times and other peoples. He becomes familiar with their manners and customs, their ideals and institutions, their mistakes and failures, and with the artistic forms in which the national genius has expressed itself. When he leaves school, such knowledge not only enriches his personal life, but makes him a more useful because a more intelligent member of society. It exerts a steadying, sanative influence, for it furnishes him with standards based upon the best performance of the race everywhere. For us Americans, with our large confidence in our own ways and destiny, there is special need of the wisdom that comes from familiarity with the life, literature, and history of the great makers of European civilization.

What has been said up to this point relates to the profit of linguistic and literary study in general, a matter about which there is no serious difference of opinion among intelligent people. When, however, we come to consider the relative value of the ancient and the modern languages, we raise a moot question over which there has been endless discussion. Here, again, we refrain from lengthy argument. Let it be remarked, however, that the question is a very large one, to be decided only in the light of long and wide experience. To reach a sane view of the matter it is necessary to make some allowance on both sides for the partisanship of the professional teacher, who is generally more or less prone to overstate the importance of his specialty. Nor should we allow too great weight to the views of publicists, men of letters, and so forth, who treat the question from a purely personal point of view. The man in middle life, who has the advantage of knowing just what knowledge is most useful to him in his own work, can usually look back upon his early education and tell a tale of neglected opportunities and misapplied energy. Educational arrangements must be made for the many, and human tastes, needs, and aptitudes are various. For the boy or girl who must select a course of study long before he or she can know just what special attainment will be the most useful in after life, it is enough to be assured that the discipline and culture derived from the study of a foreign language, whether ancient or modern, will certainly prove valuable.

The committee is of the opinion that the best course of study for the secondary school will always provide instruction in at least one ancient and one modern language. Beyond this we do not undertake to pass judgment upon the comparative merits of competing courses. It has always been the policy of the Modern Language Association not to antagonize the study of Latin and Greek. We ask for the modern languages in school and college nothing more than a fair chance to show what they are worth. We believe that they are worth, when properly taught, no less than the ancient languages.[1] It is, of course, conceded that the Latin and Greek are the more "difficult" in the initial stages. But difficulty can not be the highest test of educational utility, else Latin and Greek should themselves give way to Sanskrit and Chinese. Evidently it is the goodness of the kernel and not the thickness and hardness of the shell that we are mainly to think of. The kernel is the introduction to the life and literature of a great civilized people, whom it is, for some reason, very important for us to know about. And here it may properly be urged on behalf of the modern languages that, just in proportion as they are easier to acquire, the essential benefit of the acquisition is

[1] "It seems to me that the teaching of modern languages in many of the schools * * * has now reached such a stage that we may fairly say that a training in French or German, or both, can be given which is just as substantial, strong, and useful a training as any other that is given in the same period."—President Eliot, Educational Reform, p. 378.

Digitized by Google

the sooner realized. They give a quicker return upon the investment. This is a consideration that is of special importance for the secondary school. It is quite possible in an ordinary school course to learn to read French and German easily. The high-school graduate who has acquired this ability can at once turn it to account, even if he does not go to college. If he allows his ability to slip from him through lack of practice, it is at least his own fault. In the case of the ancient languages, on the other hand, it is a well-understood and oft-lamented fact that the great majority, even of college graduates, never learn to read Latin and Greek with ease. Up to the last the effort is more or less painful. After leaving college they usually drop their Latin and Greek, and in a short time they can not read at all. The profit of the study thus reduces, for the many, to its purely gymnastic value. That value, we are prepared to admit, is very great; but we would urge that the purely gymnastic value of the modern languages is, potentially, also very great. The argument of "difficulty" is often misused. There may be as much valuable exercise in walking five miles up a gentle slope as in climbing a mile up a sharp acclivity.

The first and greatest value of the study of the modern languages must be looked for, then, in the introduction of the learner to the life and literature of the two great peoples who, next to the English stock, have made the most important contributions to European civilization. That these literatures are as important, as worthy of study, as full of instruction for the modern man and woman as are those earlier literatures that once formed the great staple of education, is a proposition that we do not think necessary to argue, though it is sometimes denied in toto by zealous advocates of classical study. For the peculiar intellectual myopia that can see nothing new and nothing good in modern literature the only remedy is the classical hellebore.

We attach greatest importance, then, to linguistic discipline and literary culture. But the ability to read French and German has also another value not directly connected with the study of belles-lettres. In nearly all branches of knowledge at the present time a large part of the best that has been written is to be found in the German and French languages. One who wishes to study anything thoroughly, no matter what, finds it highly convenient, if not absolutely necessary, to be able to read these languages in the pursuit of information. The high-school graduate who brings this ability with him to college has a great advantage in that he can at once begin to use it as a tool in prosecuting his studies. Of those who do not go to college it is fair to presume that a considerable portion will continue some line of private study, if not as a vocation, then as an avocation. For all such the ability to read French and German will be of great service.

It is next in order to remark briefly upon what is popularly called the "practical" value of French and German—that is, their utility as a means of intercourse. The practical command of a foreign language has a potential value that is at once perceived by everyone. It is felt to be desirable by multitudes who would probably care but little for the considerations presented in the preceding paragraphs of this section. The committee hold, however, that in our general scheme of secondary education the ability to converse in French or German should be regarded as of subordinate importance. We by no means say that it should be ignored, or that colloquial practice may safely be neglected in teaching. With this point the report will deal further on. Here we merely express the opinion that the ability to converse should not be regarded as a thing of primary importance for its own sake, but as auxiliary to the higher ends of linguistic scholarship and literary culture. The grounds of this opinion are briefly as follows:

The practical command of a living language, such as will be really useful for the ordinary purposes of life, presupposes a large amount of practice in speaking. The requisite amount of practice can not possibly be given in an ordinary school course, even in a course of four years in length, in which the pupils come together

Digitized by Google

four or five times a week, perhaps in classes of considerable size, remain with the teacher for three-quarters of an hour, and the rest of the time speak English. With the most skillful teachers, working with the best methods that can be devised, and concentrating their effort upon the one aim of teaching the pupil to talk, the results of such a course, unless the work of the school is supplemented by practice at home, is only an imperfect command of the language, which is of little use outside the class room. Meanwhile the concentration of effort upon this one object necessarily involves the neglect of other things that are of more importance in the end. For it must be remembered that the process of learning to speak a foreign language has no educational value except as it is connected with, and grows out of, the improvement of the mind.

In the second place it is to be remarked that while in certain European countries, by reason of their geographical position, or the character of the population, it is of very great practical importance that the rising generation learn to speak two or three languages with facility, the conditions in the United States are different. If it were possible in the secondary school to impart a good practical command of French, it is evident that all but a minute proportion of those leaving school with this accomplishment would soon lose it for lack of occasion to use it. We have, it is true, a number of communities in which the ability to speak German is highly convenient, and may even have a local market value. But nowhere in the United States is this ability indispensable. The English language is the vernacular of the country and the medium of our civilization, and we wish it to become more so, rather than less so, with the lapse of time. So far as purely practical considerations go, it is for those who come to us to learn our language, not for us to learn theirs. If we teach a foreign language in our schools it should be for the sake of its general educational value. At the same time, its potential value as a means of intercourse may very properly be kept in view. One who has received the best training that the secondary school can give may not be able to speak his modern language with facility for the practical purposes of life, but he will have been started in the right way; will have obtained a good general knowledge of the language, and will have had some practice in speaking. If then, after leaving school, he needs to be able to speak the language, he has an excellent foundation on which to build. Proficiency will come rapidly with practice.

SECTION III.—A CRITICAL REVIEW OF METHODS OF TEACHING.

THE GRAMMAR METHOD.

When the modern languages first became a regular subject for serious study in secondary schools it was natural that teachers, having no other model to imitate, should adopt the time-honored plan followed in the department of Greek and Latin. According to this method the pupil is first put through a volume of paradigms, rules, exceptions, and examples which he learns by heart. Only when he has thoroughly mastered this book is he allowed to read; and even then his reading is usually regarded as a means of illustrating and emphasizing grammatical principles, rather than as a source of inspiration or of literary education. The amount of foreign literature studied by the class is, moreover, extremely small; but it is all carefully analyzed and translated, every lesson being, in general, repeated several times. Composition is used as an instrument for increasing still more the student's familiarity with inflections and rules. The foreign language is never spoken, and pronunciation is considered unimportant.

This method has fallen into discredit; and while it is not yet entirely banished from classical instruction, it can scarcely be found, in its original purity, among the modern language courses of any civilized region. It has, however, certain undeniable advantages. In the first place it trains the mnemonic faculty; in the

Digitized by Google

reaction against the hard, unattractive schooling of our fathers, modern pedagogical fashion has gone so far that the power of conscious acquisition and retention is hardly exercised at all; children go to college or out into life with an embryonic memory, and the teacher's task rivals the labor of the Danaïdes. Secondly, the careful study of grammatical rules and their nice application in translation and composition form one of the best possible exercises in close reasoning. It may be urged that logical processes are not natural to the child; neither are they natural to the uninstructed adult; but to be a successful student or an intelligent citizen, a boy or man must be able to arrive at rational conclusions. Hence it is one of the chief duties of education to afford practice in clear and orderly thinking. The principal value of arithmetic and algebra as secondary school studies lies in the fact that in them right and wrong reasoning are immediately and unmistakably distinguished by their results. In most subjects the white and black are not so clearly defined; between them lies a broad gray zone, the region of "not quite correct" and "not altogether bad," and it is toward this neutral belt that nearly all the pupil's efforts tend. The children "don't see why" their answer is not as good as any other, and the sloth and slovenliness native to the untrained human mind remain undisturbed. Now, grammatical analysis and synthesis, while less mechanical and more varied in their operation than elementary mathematics, are nearly or quite equal to it as a means of inculcating the habit of accurate ratiocination.

On the other hand, the grammar method is open to criticism on the ground that it neglects two of the most important objects of foreign-language study: the broadening of the mind through contact with the life, the ideas, and the forms of thought and expression of different times and countries; and the cultivation of the artistic sense by the appreciative study of literary masterpieces. A still more potent objection is the contention that pure grammar is not calculated to inspire interest in pupils of the high-school age. This objection seems to be well founded, and, if so, it is a fatal one; for modern pedagogy, if it has accomplished nothing else, has established the fact that interest is absolutely essential to the performance of the best work in any field. It appears, then, that the day of the pure grammar method is past; but while devising a system more in accordance with the principles and the possibilities of our time, let us not forget that the old-fashioned way had its good features.

THE NATURAL METHOD.

At the opposite pedagogical pole from the process just described, we find the conversational or "natural" method. This educational "naturalism" is a reaction against the inflexible systematism of earlier teachers; we should, therefore, expect it to be somewhat aggressive and somewhat formless, more given to pulling down than to building up. It is a principle, an impulse, rather than a plan; and its products depend, to a greater extent than those of any other school, on the personality of the instructor. Too often the results of a protracted and supposedly successful course of unalloyed conversation are a rapid, but unintelligible pronunciation, the fluent use of incorrect forms, and, worst of all, a most discouraging self-complacency. Some peculiarly gifted teachers have succeeded in combining alertness with a reasonable degree of accuracy, but it will probably be found, in all such cases, that the instructor has resorted to devices not strictly "natural."

What is the genuine "natural method?" In its extreme form, it consists of a series of monologues by the teacher, interspersed with exchanges of question and answer between instructor and pupil—all in the foreign language; almost the only evidence of system is the arrangement, in a general way, of the easier discourses and dialogues at the beginning, and the more difficult at the end. A great deal of pantomime accompanies the talk. With the aid of this gesticulation, by

Digitized by Google

attentive listening, and by dint of much repetition the beginner comes to associate certain acts and objects with certain combinations of sound, and finally reaches the point of reproducing the foreign words or phrases. When he has arrived at this stage, the expressions already familiar are connected with new ones in such a way that the former give the clue to the latter, and the vocabulary is rapidly extended, even general and abstract ideas being ultimately brought within the student's comprehension. The mother tongue is strictly banished, not only from the pupil's lips, but, as far as possible, from his mind. Not until a considerable familiarity with the spoken idiom has been attained is the scholar permitted to see the foreign language in print; the study of grammar is reserved for a still later period. Composition consists of the written reproduction of the phrases orally acquired.

This method—if "method" is the proper term—is based on two general ideas; one true, the other false. The first is the belief that the interest so necessary to the successful prosecution of any study (and especially of language work) can most easily be aroused by the actual spoken use of the foreign tongue. The second is the theory that a boy or man can best learn a new language in the manner in which an infant first acquires its native speech. Hence comes the epithet "natural." The advocates of this view overlook, first, the fact that the child requires eight or ten years of incessant practice to gain even a tolerable command of its own tongue, and, secondly, the vast difference between the mind of the baby and that of the youth. The really natural methods of acquisition at these two stages of development are almost diametrically opposed. Let us consider, for instance, the learning of pronunciation. The newborn child, after various unsuccessful experiments, reproduces sounds correctly because it has no previous habits of speech to contend with. The boy or man, unless he is phonetically trained or exceptionally acute of hearing, does not imitate at all. He merely substitutes for the several strange vowels and consonants the English sounds which the foreign ones happen to suggest to him. That is why the pronunciation of conversational classes is generally not a whit better than that of scholars taught after the most antiquated fashion. In the attempt to inculcate the other elements of speech—inflections, syntax, and phraseology—the purely imitative process shows itself to be almost equally inadequate. We may justly urge, furthermore, against this style of teaching, that it provides little discipline for the intelligence; that it affords only the poorest kind of mnemonic training; that it favors vagueness of thought and imprecision of expression, and, finally, that it sacrifices the artistic interest of language study to a so-called "practical" one. On the other hand, it certainly does awaken enthusiasm among its disciples, and it stimulates and holds the attention.

The natural method has been vehemently attacked and just as vigorously defended. At present the violence of the conflict has abated, and we are able to judge dispassionately the results of its introduction into our educational life. Those results have been mainly good. In summer schools and other institutions that have used the imitative process exclusively most of the pupils are persons who have had or will soon get some practice in grammar and reading. For them the conversation lessons are supplementary and form a useful addition to their training. In schools and colleges that have not accepted the "naturalistic" theory the fame of the new method has obliged teachers to adopt some of its practical features, thus bringing much-needed life and variety into their instruction. It seems probable that the next generation will regard "naturalism" rather as a vivifying influence than as an independent method.[1]

[1] For a description of the natural method see Der Leitfaden für den Unterricht in der deutschen Sprache, by G. Heness, and L. Sauveur's Introduction to the Teaching of Living Languages. The method is well exemplified, not only in the Leitfaden, but in Der Sprachlehrer unter seinen Schülern, by Heness, and in Sauveur's Causeries avec mes élèves and Petites causeries. All these works are now published by Messrs. Henry Holt & Co., of New York.

THE PSYCHOLOGICAL METHOD.

Out of the conviction that modern-language study should be made attractive, and out of the desire to adapt instruction to the known workings of the human mind, has come a system that seems more deserving of serious attention than the grammar method or the "natural" style of teaching. This is the system invented by Gouin and brought into general notice by Bétis.[1]

The psychological method rests on the principle of the association of ideas and the habit of "mental visualization." The whole current vocabulary of a language, in the form of short, idiomatic sentences, is divided up into groups, every group consisting of phrases that are intimately connected in subject. One group forms a lesson. These brief divisions are gathered together in chapters, each of which treats of one general topic, and several chapters make a "series." When a pupil has gone through all the series, with numerous reviews, he will have mastered (so we are told) the whole spoken language. Every lesson is first worked out orally and then studied by the pupil from his book. On presenting each new word to the beginner the instructor exhorts him to close his eyes and form a distinct mental picture of the thing or act represented. This image (it is affirmed) will remain indissolubly connected with the word, and the evocation of the one will always recall the other. Sometimes real objects or drawings are used, and pantomime is frequently resorted to; but in most cases reliance is placed on the child's active imagination. It is never considered a sin to put in a word or two of English, and at the outset that language is very freely employed. Although most of the talking is done by the teacher, the pupils are constantly called upon to repeat his sentences and to answer questions. After the first lessons written compositions may be prepared, made up of phrases already acquired. Grammatical instruction is begun early, concurrently with the other exercises, but the reading of consecutive texts is postponed until the bulk of the ordinary vocabulary has been learned. Many innovations have been introduced into the presentation of grammar, but most of them are more radical in appearance than in reality. Some, however, are extremely ingenious, and will doubtless be copied by instructors who do not see fit to adopt the whole system.

The Bétis method has the following obvious advantages: It trains the memory; it fascinates the student and holds his attention more closely than any other mode of teaching now in vogue; it gives the pupil, in a reasonably short time, a ready command over a large, well-arranged, and well-digested vocabulary; it affords, through some of its conversational groups, an insight into the life of a foreign country. As for the other side, the system seems, as far as we can ascertain the facts, to lay itself open to these criticisms: It affords but little opportunity for the exercise of judgment; it entirely neglects, in the first years, the cultivation of the æsthetic sense, and assigns literary study to a stage which high-school pupils will scarcely ever reach. Moreover, its treatment of pronunciation is decidedly unsatisfactory; but this defect can probably be remedied without disturbing the rest of the scheme.

---

[1] Its operation and results are described at considerable length in Die neueren Sprachen, by R. Kron in III, 1, 2, 3, 4, 5, 6 (published separately under the title Die Methode Gouin, oder das Serien-System in Theorie und Praxis, Marburg, 1896), and by V. Knorr in III, 8, and V, 9. The method has been subjected to a searching criticism by Traugott in the same periodical, VI, 6. It should be said here that Bétis has considerably altered the original plan; and opinions are divided concerning the respective advantages of the two versions. The real Gouin system can be studied in the author's Art d'enseigner et d'étudier les langues, Paris, 1880 (third edition in 1897); the Bétis or "psychological" method is illustrated by a volume called The Facts of Life, New York, 1896, by Bétis and Swan. Without presuming to pass judgment on the merits of the case, we shall confine ourselves to the revised plan, since that is the one more widely known and the only one that has been tried in America. It was brought to the attention of the English-speaking world in 1892 and 1896 by the articles of W. T. Stead in the Review of Reviews. In the years 1895–1897 it was used in Boston, Mass., by Bétis himself, and it is now on trial in one of the public high schools of the same city.

THE PHONETIC METHOD.

Pronunciation, neglected in the three modes of instruction just mentioned, is the very foundation of a system that has of late years attracted attention in all northern Europe, and has gained a considerable footing in Germany and Scandinavia.[1] Its advocates, while not entirely free from the intolerance and the self-confidence so characteristic of enthusiastic reformers, are men of sound scholarship, successful experience, and good standing in the educational world. As far as can be ascertained, they have arrived at results which go far toward justifying their seemingly extravagant claims. There have been few attempts to introduce the phonetic teaching in this country; probably the most extensive trial of it has been made at the Johns Hopkins University.

The phonetic method resembles the "natural" and the "psychological" schools in that it takes the modern spoken language as a basis and at first relies mainly on oral instruction, using as far as possible the foreign language itself as a medium of communication. Unlike most "conversation" courses, however, it is very systematically constructed and its beginning is strictly scientific. It begins with a training of the ear and the vocal organs, the pupils being thoroughly drilled in the vowels and consonants of the strange tongue. These sounds are considered both as isolated phenomena and as elements of idiomatic phrases. The phrases, in turn, are combined into dialogues, descriptions, and stories. At this stage printed texts are used, but only in phonetic notation. The ordinary spelling is carefully kept from the students during the elementary period. It is said that the transition from sound symbols to standard orthography presents no serious difficulty. Objects, pictures, and maps are constantly displayed, and every effort is made to familiarize the class with the surroundings, the institutions, the habits, the character, and the mode of thought of the people whose language they are learning. The phonetic texts gradually increase in length and difficulty, and some of the latest are representative of literature. Inflections and syntax are studied inductively. Composition consists first of the oral and written reproduction of matter already heard or read, then of combinations of familiar phrases. Systematic grammar is reserved for a late stage, and translation comes last of all.

It is evident that this sort of instruction requires a special preparation and a special apparatus. Although the pupils are not taught phonetics, it is essential that the teacher be something of a phonetician; and the present difficulty of obtaining adequate instruction in the science of speech-sounds has doubtless done much to hinder the rapid general adoption of Vietor's programme. Let us hope

[1] The names by which it is known are the "reform," the "new," and the "phonetic" methods. It was outlined by Vietor in his famous monograph, Der Sprachunterricht musz umkehren (1882, new edition, Heilbronn, 1886), and its principal features are set forth on the cover of every number of the Maître phonétique. Both this periodical (the organ of the Association Phonétique Internationale) and Die neueren Sprachen, edited by Vietor, are devoted to the propagation of the phonetic method. The list of publications—books, pamphlets, and articles—which deal with the "reform method" is very large. A complete bibliography down to 1893 is given by H. Breymann in Die neusprachliche Reform-Litteratur von 1876-1893, eine bibliographisch-kritische Übersicht, Leipzig, 1893. Two articles by leading exponents of the method have appeared in American journals, viz, "A new method of language teaching," by W. Vietor, in the Educational Review, Vol. VI, p. 351, and "Phonetics and reform method," by A. Rambeau, in Modern Language Notes, Vol. VIII, p. 161. An excellent report of observations made during a six months' tour of inspection of German schools is given by Mary Brebner in The Method of Teaching Modern Languages in Germany: New York, Macmillan, 1898, and this is now admirably supplemented by the work of Karl Breul, The Teaching of Modern Foreign Languages in our [English] Secondary Schools, New York, Macmillan, 1898. A conservative and at the same time fairly representative presentation of the aims and methods of the "reformers" is given by W. Münch in his and F. Glauning's Didaktik und Methodik des französischen und englischen Unterrichts, Sonderausgabe aus A. Baumeister's Handbuch der Erziehungs-und Unterrichtslehre für höhere Schulen. On pp. 102 sq. is to be found a select list of the more important writings on method in modern-language teaching which have appeared in recent years.

Digitized by Google

that in the near future such training will be brought within the reach of all by means of courses conducted, in our universities and in our summer schools, by men who unite with the necessary scientific attainments a practical knowledge of the requirements of American pedagogy. Phonetic texts, too, though not absolutely indispensable, are of the greatest assistance.[1]

This method, while it lacks the logical discipline of the old grammatical instruction, is more successful than any other in forming a good pronunciation and in giving pupils a ready and accurate control of the spoken language. The training it affords can hardly fail, moreover, to improve the quality of the student's voice and his enunciation of his mother tongue. From the standpoint of mnemonic education, too, it ranks high. In stimulating interest it is nearly equal to the "natural" and "psychological" courses, and it is second only to the latter in holding the attention. The training of the attention should, by the way, be regarded as an important part of any pedagogical scheme; for the habit of inattention—the utter inability of pupils to fix their minds on anything for more than a few minutes at a time—is the most serious obstacle that confronts our secondary teachers. The attempt to give scholars, by ear and eye, by description and by the use of objects and pictures, a correct and vivid idea of foreign life has been carried further by the phoneticians than by any other school; but there is no reason, save the lack of rightly prepared instructors, why this feature should not be introduced into every method; the neglect of it defeats one of the principal objects of modern-language study. Another means to the same end is the system of international correspondence between school children of different countries.[2]

What are the disadvantages of the "phonetic" plan, when we consider it from the point of view of our American high schools? In the first place, it seems, like other "oral" methods, to overlook the importance of literary education, for it postpones the reading of real books to a stage that is beyond our secondary period. In Europe, where intercourse between foreign countries is easy and frequent, and a command of several languages has a recognized commercial value, it is natural that a practical mastery of the strange tongue should seem highly desirable. With us, isolated as we are, a speaking knowledge of French and German has,

[1] Some good ones are already available: For French, F. Beyer and P. Passy; Rambeau and J. Passy have provided us with suitable chrestomathies; in German, we have a little book by Vietor; the Maître phonétique furthermore, is constantly furnishing material in various languages.

[2] Mentioned by Vietor in Die neueren Sprachen, V, 3, 165, and described by Professor Magill in Modern Language Notes, XIII, 3. The plan was first suggested in the Revue universitaire for June, 1896, by Prof. P. Mieille, who gave an account of his efforts to bring about an interchange of letters between French children studying English and English children studying French. His idea attracted immediate attention in France and England, ere long also in Germany, Italy, and the United States, and it was soon perceived that it could be turned to profit, not only for school children, but also for adults, especially for teachers. Having already been tried on a large scale, the plan has passed the experimental stage and may be confidently recommended as a valuable aid in the learning of a living language. At first, correspondents could be secured only through certain journals, which published lists of names in consideration of a subscription. Later, on the initiative of the Manuel général de l'instruction primaire, a large committee was appointed, which now undertakes gratuitously to bring correspondents together. The vice-president of the English section for women is Miss E. Williams, professeur aux Écoles de Sèvres et de Fontinay, whose address is No. 6 rue de la Sorbonne, Paris. Miss Williams's secretary, who conducts her correspondence, is Mme. Rossignol, 117 rue Nôtre Dame de Champs, Paris. The vice-president of the English section for men is Prof. A. Mouchet, 16 rue de St. Guillaume, Asnières (près Paris). Any one of these three can be addressed by American teachers desiring French correspondents for themselves or for their pupils. In Germany the plan has been taken up prominently by Dr. K. A. Martin Hartmann, of Leipsic, who has reported upon a trial of it in the Saxon schools and published a body of Vorschläge relating to it. The advantages of the system are well set forth by Petri in Die neueren Sprachen VI, 511, and objections to it are answered by Hartmann in the same journal, VI, 324. A second and more extended article by Prof. Edw. H. Magill, of Swarthmore College, Pennsylvania, may be found in Modern Language Notes for February, 1899.

except for teachers, but little pecuniary worth; and even in the case of a student who has acquired it for pleasure alone, the opportunities for practice are so few that his hardly won accomplishment will soon slip from him. Familiarity with pronunciation and a certain ability to handle foreign constructions are, indeed, essential to a proper appreciation of the literature; but if literary study is not reached, of what avail is the preparatory training? For we must bear in mind that the vast majority of our pupils—those for whom the course should be planned—will not continue their education beyond the high school. It has been pointed out that oral work, besides exercising the organs of speech, arouses interest and fosters a certain alertness of mind, and is therefore valuable for its own sake. We may question, however, whether these benefits make up for the sacrifice of all the æsthetic culture and the intellectual broadening that come only from the reading of good books.

To this criticism the European advocates of the method would surely reply that they believe in abundant reading, after the student has mastered the spoken idiom. It appears, then, that the real fault of their programme, as applied to our conditions, is not so much that its underlying principle is entirely incompatible with our creed as that it calls for much more time than we allot to foreign language. In fact, we may well doubt whether with our three or four hours a week for three or four years our scholars would ever reach the end even of the elementary stage; they certainly would not go beyond it; their acquisition would be only a fragment. If we should wish to introduce this or any other thoroughgoing method, we should be obliged to increase the importance of French and German in the school curriculum; and such increase is desirable from every point of view. Not only should the pupils who are intending to continue these studies in college receive the best possible preliminary training, but all children who begin the subjects at all should give them time enough to admit of an extended course, conducted according to the most enlightened principles. In order to gain the necessary hours, the foreign language must be taken up earlier, or some other high-school topic must be sacrificed. A few things thoroughly and intelligently done make the best secondary discipline. As long, however, as our present conditions last it is clear that we must give up something. Until we are all willing greatly to lengthen the time given to the linguistic part of our children's education, we shall have to renounce the idea of a full, well-rounded knowedge of French and German, and, selecting the portion of the subject that appears most important for the greatest number, devote ourselves to the cultivation of that restricted field. Considerations of this nature have led many thoughtful teachers to adopt a mode of instruction that we may call the "reading method."

THE READING METHOD.

The title explains itself. The study of texts from the very beginning of the course, abundant practice in translation at sight, leading ultimately to the ability to read the foreign language with ease and without the interposition of English, are the principal features of this programme. Grammar and composition are regarded merely as a help to reading, and are reduced to the essentials; sometimes accidence and syntax are first learned inductively, but oftener a small text-book is used concurrently with translation. Great importance is attached to the use of good English in the renderings. Pronunciation receives scant attention; there is little or no oral exercise.

This method has been much used of late in our schools and colleges, especially in those that have large classes, a short course, and an American teacher. The great advantage of the process is that it quickly enables the student to read French and German literature—not with the complete appreciation that only an all-around command of the language can give, but with the same kind of intelli-

Digitized by Google

gence and enjoyment with which good classical scholars read Latin. Indirectly, it helps the pupil to form a good style, and to increase the volume and precision of his English vocabulary; it cultivates the taste by dwelling upon delicacies of expression; it exercises the memory through the enforced retention of words and idioms; it trains the linguistic sense by calling attention to the points of resemblance and difference in various tongues; and the exact fitting of phrase to thought forms an excellent discipline for the judgment.

On the other hand, in addition to the fact that it deals with only one aspect of language, the reading method is lacking in vivacity and in stimulus to the attention; it interests only the more serious pupils. Moreover, the continued use, year after year, of an easy way of teaching—for it is comparatively easy, and requires but little special training—may prove demoralizing to the instructor, dull his appetite for self-improvement, and make him indolent and easily satisfied with his qualifications.

Section IV.—Method as Related to the Preparation of Teachers.

If all our classes were in the hands of born teachers, ideally prepared for their work, advice with respect to method would be quite superfluous. Every teacher would create for himself the method best suited to his class and to his own peculiar gifts. His personality would infuse life and efficacy into any process he would be likely to adopt. But in a profession so widely pursued we can not expect the majority of its followers to show genuine vocation. The most of our teachers are made, and we must see to it that they be as well made as possible. It can not be too strongly urged upon school authorities that if modern-language instruction is to do the good work which it is capable of doing it must be given by thoroughly competent teachers. The committee's investigations show, and it is a pleasure to testify to the fact, that we already have a goodly number of secondary teachers who answer to that description. Nevertheless, our general standard is still far too low. For some time to come the majority of our teachers will necessarily be guided to a large extent, in their choice of methods, by the consideration of their own competence.

But while it is easy to insist, broadly, upon the importance of adequate preparation for teachers, it is not so easy to define, in exact terms, the minimum of attainment which can be regarded as sufficient. Much will always depend upon personality, upon general alertness of mind and aptitude for teaching. The best of teachers learn with their pupils, and it will sometimes happen that one who knows too little of his subject will teach it better than another who knows more. Nevertheless, it remains broadly true, and should never be forgotten for a moment, that what the teacher most needs is to be a master of his subject. With the sense of all-around mastery come independence of judgment and the right kind of self-assurance. Without this sense the attempt to follow someone else's method, however good the method may be in the hands of its inventor, can never produce the best results.

To be ideally prepared for giving instruction in a modern language, even in a secondary school, one should have, aside from the ability to teach and the general personal culture necessary to secure the respect and attachment of pupils, a thorough practical command of the language to be taught, a solid knowledge of its literature, and a first-hand acquaintance with the foreign life of which the literature is the reflection. To be decently prepared, he should, at least, have read so much in the recent literature of the language that he can read about as easily as he would read matter of the same kind in English. He should have studied the principal works of the great writers, and should have taken a course in the general history of the literature. He should know thoroughly the grammar of the language in its present form. If he has some knowledge of the historical development of

Digitized by Google

forms, such knowledge will help him in his teaching, especially in the teaching of French to pupils who have studied Latin. He should be able to pronounce the language intelligently and with reasonable accuracy, though he may not have the perfect "accent" of one who is to the manner born. He should be able to write a letter or a short essay in the language without making gross mistakes in grammar or idiom, and to carry on an ordinary conversation in the language without a sense of painful embarrassment. Even this degree of attainment will usually require residence abroad of those for whom English is the mother tongue, unless they have enjoyed exceptional opportunities in this country. In any case, the residence abroad is greatly to be desired..

In insisting that secondary teachers of a modern language should be able to speak the language with at least moderate facility and correctness, the members of the committee are well aware that they set up a standard higher than that which has very generally been deemed sufficient. But it is a standard to which we must come. Many of the best schools have already come to it. Nor need we fear that such a standard will result permanently to the advantage of the foreign-born teacher in the competition for positions. If we leave out of account cases of exceptional individual talent for teaching, the general principle holds good that the best teacher of a foreign language is a person of the same nationality as his pupils who is thoroughly at home in the language to be taught. The American-born teacher will thus have a substantial advantage over his foreign-born competitor, but he can not afford to be vulnerable in so vital a point as the practical command of the language in which he undertakes to give instruction.

To many of our teachers residence in Europe will probably seem out of the question. Those who, by dint of thrift and sacrifice, contrive to cross the ocean can now enjoy fine opportunities in the way of summer courses at Paris, Geneva, Jena. Marburg, Greifswald, and elsewhere. The others must content themselves for the time being with a somewhat inadequate equipment, the defects of which, however, can be to a great extent remedied by the reading of well-chosen books, by work in American summer schools, and by association with foreigners in this country. It is to be hoped that our colleges and universities will recognize, more largely than they have heretofore recognized, the need of practical courses for teachers of the modern languages.

With respect, now, to the main subject of this section, it is hardly necessary to observe that the teacher who can not himself speak his modern language should not attempt seriously to teach his pupils to speak it. He should not try to work the "natural method," or any private variation thereof; if he does, he will be almost certain to do more harm than good. He may and should provide memory exercises that exhibit natural colloquial forms, but in so doing he should be guided by some good manual, and make that the basis of the class-room work. The native German or Frenchman will naturally think that success will be easy for him in a "conversation" course, but it is for him to remember that he can accomplish nothing worth while without system; that he must have the proper books; that he can not comprehend his pupils' difficulties unless he knows English well, and that he can never govern his class unless he has a sympathetic understanding of American character. For the "psychological," and still more for the "phonetic" programme, special study is necessary, and no one, foreigner or native, should imagine that he can cope with such a method offhand.

But if the availability and the goodness of the several methods described in the preceding section depend mainly upon the fitness of the teacher, they also depend upon the age of pupils, the probable length of the course, and the size of classes. If the study begins in childhood and the beginner is looking forward to a long and thorough course of the best possible kind, it is obviously the right thing that he devote a large amount of time at first to the acquisition of a faultless pronunciation and an easy command of the colloquial language. He will then have the best

Digitized by Google

possible foundation for literary study. But if he begins later in life and the problem is to realize the maximum of benefit from a limited course, he should devote less time to the colloquial language and proceed more quickly to the study of literature. It is also evident that in classes of considerable size the most efficient colloquial practice can not be given; the pupils may learn to understand the language (and this is of course well worth while) but they will not learn to speak with much facility. If this report were intended to meet ideal conditions, that is, if it were addressed to teachers whose training would permit them to choose freely from the methods that have been described and to combine them with wise discretion, the committee might be disposed (although in that case, as we have already remarked, advice with regard to method would hardly be needed) to make some such recommendations as the following: For very young children, say up to the age of 10, the "natural" or imitative method of the nurse or the governess, with some help perhaps from the "psychological" method. For a course of six years, beginning, say, at the age of 12, a combination during the first three years of the "psychological" and "phonetic" methods, accompanied by some study of grammar; after that a more thorough study of grammar, together with the reading and translation of good literature, supplemented by oral practice in the language and written composition. For a four years' course, beginning in the high school, we should recommend a similar procedure, the division between the "psychological-phonetic" and the "reading" method coming, however, somewhat earlier, say, after the first year. In combining the "psychological" and "phonetic" methods the general plan of the former would be followed, while the latter would be imitated in its treatment of pronunciation and, so far at least as French is concerned, in its use of phonetically transcribed texts. For any shorter course we should advise the "reading" method, accompanied, however, by scientific training in pronunciation, drill in the rudiments of grammar, and a moderate amount of oral practice.

Recognizing the somewhat idealistic character of these recommendations, the committee will present further on a scheme of secondary courses, with suggestions relating thereto, which are meant to be adapted to existing conditions. First, however, it is necessary to deal briefly with another subject, or rather with two closely related subjects, which are more or less involved in any consideration of the modern languages in secondary education.

SECTION V.—MODERN LANGUAGES IN THE PRIMARY GRADES; THE EXTENSION OF THE HIGH-SCHOOL COURSE.

In a number of American cities modern-language instruction, mainly German, has already been introduced in the primary[1] grades of the public schools, and the propriety and value of such instruction have been warmly debated in the newspapers and in local educational circles. On the one hand, it is urged that in any community where Germans preponderate or constitute even a large minority of the taxpayers they have a right to demand that the German language be taught in the public schools. The reply is made that the primary schools of the United States have an important function to perform in preparing children for life and citizenship in an English-speaking country, and that this mission will best be performed if the English language and no other is made the subject and the medium of instruction. To this it is rejoined that the learning of a foreign language in childhood need not prejudice the learning of English or of any other important subject, that the rudiments are quickly and easily acquired, and that the early beginning is in accordance with sound pedagogical principles. This line of assertion, in turn, is met with the reply that the primary schools have all they can do in teaching the subjects that are of obvious and undeniable use to everybody, and

[1] We use the word "primary" to denote in a general way all grades below the high school.

Digitized by Google

that the smattering of a foreign language which they can impart serves no educational purpose and is of no practical value in life.

When the issue is thus stated one sees at once that there is a measure of soundness in all these contentions. The committee feel that it would be futile to attempt here an answer to the question whether it is or is not desirable, in the abstract, that a foreign language be taught in the primary grades of our public schools. The question in its politico-social bearings is a very large one, but it is a question which every community must and will decide for itself in view of local conditions, and the wisdom of its decision must abide the test of experience. We believe, however, that experience is already sufficient to enable us to formulate certain general principles which should always be kept in view in the practical management of the matter under consideration.

In the first place, if a foreign language is taken up in the primary grades, it should always be as an optional study. This point seems to require no argument. The value of the study is at best so uncertain, so dependent upon circumstances of one kind or another, that the work should not be made obligatory for anyone.

In the second place, it is not worth while, as a rule, that the study of a foreign language be taken up in the primary grades unless the beginner has at least a prospect and an intention of going on through the secondary school. The reason for this opinion is that what can be acquired of a modern language in the primary grades, even with the best of teaching and under the most favorable conditions, is good for nothing except as a foundation. For while it is true that children learn quickly and easily the rudiments of "conversation" in a foreign tongue, it is also true that they forget them no less quickly and easily. The children of parents who speak German at home and expect to speak it more or less all their lives, may be taught in the primary school to use the language a little more correctly; but if they leave school at the age of 12 or 14, they inevitably drop back into the speech habits of those with whom they associate, and their school training thus becomes, so far as the German language is concerned, a reminiscence of time wasted. The children of parents who speak English at home may get a smattering of German at school; but if they leave school at the age of 12 or 14 they soon forget all they have learned.

In the third place, if a foreign language is taught in the primary grades, it should be by teachers who handle the language easily and idiomatically. Classes should be as small as possible and there should be at least one exercise on every school day. Infrequent lessons in large classes amount to nothing. It is important that the teacher know his pupils intimately and be able to adapt his instruction to their individual needs. The general aim should be to familiarize the learner with the vocabulary and phraseology of the spoken language and to teach him to express himself readily and correctly in easy sentences. The free use of objects and pictures is to be recommended.

In what has just been said we have had in view the usual arrangement of work, in accordance with which the secondary or high school is supposed to begin with the ninth grade (the average pupil being then about 14 years old) and to extend over a period of four years. Grades below the ninth we have classed as primary. But while this is still the typical arrangement for the country at large, schoolmen have here and there lengthened the high school by extending it downward; in other words, by making provision that some of the solid disciplinary studies of the secondary period shall begin in the seventh or eighth grade. There appears to be strong argument in favor of this plan. It is urged by thoughtful schoolmen that our American high school has become congested; that the increased requirements of the colleges and the pressing demands of new subjects for "recognition" have given to the secondary school more work than it can do thoroughly in the traditional allotment of time. When, as sometimes happens, the colleges are blamed for this state of affairs and it is suggested that they reduce their requirements for admission, they are able to reply with much force that present

Digitized by Google

requirements, even where they are highest, are none too high unless we are willing to fall far below the standard of the Old World. The average graduate of an American high school is of about the same age as the average graduate of a German gymnasium, but the latter is further along in his studies and better prepared for higher work. We have therefore to consider the problem of strengthening the preparatory course while recognizing that the ordinary four-year curriculum can bear no further burdens and should, if anything, be simplified. Of this problem the obvious solution is to begin the proper work of the high school at an earlier date. Instead of dividing our educational years into eight primary, four secondary, and seven or eight higher, we should divide them into six primary, six secondary, and six higher.

It is probable then that the six-year high-school course will meet with increasing favor, for the idea is a good one. At the same time we can not expect that the now usual organization of school work will be changed immediately or even rapidly, and for this reason the model courses to be described below have been drawn up primarily with reference to existing conditions. Our principal object in touching here upon the subject of the six-year secondary curriculum was to prepare the way for an expression of the opinion that, where such extended courses are provided, a modern language can be very advantageously begun in the seventh grade.

Whether Latin or a modern language should come first in a well-ordered course of study is a question upon which teachers differ. It is one of the questions upon which, in the existing state of psychological and pedagogical science, it is just as well not to dogmatize. In fixing the order of studies in any school course, practical considerations of one kind or another will often outweigh general argument. Probably the sanest view of the matter is that it does not make very much difference whether Latin or a modern language precedes, if only the elementary instruction in either case be rightly adapted to the learner's age and mental condition. It is often urged that the discipline afforded by the study of Latin makes the subsequent learning of a modern language easier. This is true, but the converse is no less true. In beginning the serious study of any foreign language there are certain mental habits to be formed, certain faculties to be called into play and exercised. The pupil must learn how to study. He must become familiar with strange forms and with their equivalent in his own tongue. He must learn what idiom means and how to translate; must learn to observe, compare, and think. For the purpose of this elementary discipline one language is as good as another, if only the teaching be intelligent; and the discipline of the first linguistic study makes the second easier. In general, it is safe to assert that the average boy or girl of 12 will take more kindly to French or German than to Latin. The modern language is easier and more interesting. It seems more real and practical. Progress is more rapid. The value of the Latin has to be taken on trust, that of the modern language is more obvious to the juvenile mind. For children of 12 the Latin grammar is a very severe study. It means usually for many months little more than a loading of the memory with paradigms, a blind investment of labor for the sake of a mysterious future profit which the learner can not comprehend. The elementary reading matter is usually dull stuff, devised to illustrate grammar. Up through Cæsar's Commentaries there is almost nothing to touch the feeling, to feed the imagination, or to suggest a real connection with the pupil's own life. It is all a grind; in its time and place, to be sure, a very useful grind. We believe in it heartily. But the question is whether for children of 12 it is not best to break the force of the initial impact with Latin by using a modern language as a buffer.

It may also be remarked, finally, that one who wishes to acquire a modern language thoroughly will always do well to begin in childhood. The later period of youth is distinctly a bad time to begin. In childhood the organs of speech are still in a plastic condition. Good habits are easily formed; bad habits more easily

Digitized by Google

corrected. The mind acts more naively, and the memory is tenacious of whatever interests. Forms of expression are readily mastered as simple facts. Later in life, in proportion as the mind grows stronger, it also grows more rigid. The habit of analyzing and reasoning interferes more or less with the natural receptivity of the child. The fixation of speech habits in the mother tongue makes it increasingly difficult to acquire even a moderately good pronunciation, and perfection is usually out of the question.

SECTION VI.—PROPOSAL OF THREE NATIONAL GRADES OF PREPARATORY INSTRUCTION IN THE MODERN LANGUAGES.

Thus far this report has not dealt specifically with requirements for admission to college. In accordance with the idea embodied in the resolution referred to in Section I, we have approached our subject from the point of view of the secondary schools. We have endeavored to state and explain the principles which should be kept in view in order to render our school work in French and German as valuable as possible to the learner. We have recognized that the secondary school does not exist solely or even mainly for the sake of its preparatory function; and what we have said would be in the main true, and we hope valuable, even if there were no colleges. Nevertheless the preparatory function of the secondary school is obviously of very great importance. In practice secondary courses are shaped quite largely with reference to college requirements. The school naturally looks to the college as a regulative influence. It turns to the college catalogue, learns what must be done to prepare its pupils for admission, and concludes, not unnaturally, that this is about what ought to be done from an educational point of view. In the absence of any central control of education in the United States this regulative influence of the college is the most potent agency at our command for creating and maintaining a high standard of secondary teaching. We come, then, to the subject of secondary instruction as related to college requirements.

For the purpose of simplifying the relation between the colleges and the secondary schools and for the purpose of securing greater efficiency and greater uniformity in the work of the schools, it is hereby proposed that there be recognized, for the country at large, three grades of preparatory instruction in French and German, to be known as the elementary, the intermediate, and the advanced, and that the colleges be invited to adopt the practice of stating their requirements in terms of the national grades.

Explanatory.—The proposed three grades are designed to correspond normally to courses of two, three, and four years, respectively, the work being supposed to begin in the first year of a four-year high-school course, and to proceed at the uniform rate of four recitations a week. The elementary course is designed to furnish the minimum of preparation required by a number of colleges in addition to the Latin and Greek of the classical preparatory course. The intermediate course is designed to furnish the preparation required by many colleges which permit the substitution of a modern language for Greek. The advanced course is designed to furnish the highest grade of preparation of which the secondary school will ordinarily be capable in a four-year course.

With respect to the time required, in years and in hours per week, for the satisfactory completion of the work to be outlined below, it should be said that the committee has no thought of imposing upon the schools an inflexible programme. Teachers will continue to make their programmes in accordance with their own judgment and convenience. The rapidity with which the proposed work can be done will, of course, vary greatly in different schools, with the age and aptitude of pupils, the size of classes, the efficiency of teaching, and according as the beginner of French or German has or has not studied Latin. It makes no small difference whether the modern language is begun in the first year or in the third year of the high-school course. In attempting to draw up model courses, however, the com-

Digitized by Google

mittee obviously had to make some definite assumption with regard to the time of beginning and the number of recitations per week. It was also necessary to provide for the case of the work beginning in the first year, since many of our best schools already have four-year courses in German or French, or both. It is clearly desirable that such courses be made as good as possible, and that they have a recognized place and value in our general scheme of requirements for admission to college.

With regard to the four recitations per week let it be observed that that number has been made the basis of our calculations, not because the committee prefer it to five, or wish to recommend it to the schools instead of five, but because it is believed to be the smallest number that will permit the proper completion of the work proposed, if the work begins in the first year. Where a modern language is begun in the third year of a high school, it may be possible to complete the intermediate course in two years at the rate of five recitations a week, and the elementary course in proportionally less time. Where French is taken up in the last year of the classical preparatory course, it may be possible sometimes to meet the elementary requirement in one year at the rate of five recitations a week. But this will almost never be possible in the case of German, and in general the committee do not recommend one-year courses. The attempt to meet the elementary requirement in one year will result usually in a cramming process with neglect of that thorough drill upon the rudiments which is necessary for a good foundation.

In drawing up model courses the committee has had in view the needs and the conditions of the United States at large.[1] The work of the subcommittee charged with the matter was first submitted for criticism and suggestions to some two hundred secondary teachers of known ability and experience. It was then carefully revised in the light of the information and opinions gathered, and finally ran the gauntlet of thorough discussion in the committee of twelve. It is believed to represent the best intelligence of the country; to set a standard which is high, but not too high, and to be throughout entirely practicable. Teachers who do not find their own ideas perfectly expressed by the scheme will please remember that the committee had to find its way among a multitude of counselors.

SECTION VII.—THE ELEMENTARY COURSE IN GERMAN.

(*a*) THE AIM OF THE INSTRUCTION.

At the end of the elementary course in German the pupil should be able to read at sight, and to translate, if called upon, by way of proving his ability to read, a passage of very easy dialogue or narrative prose, help being given upon unusual words and constructions; to put into German short English sentences taken from the language of every-day life or based upon the text given for translation, and to answer questions upon the rudiments of the grammar as defined below.

(*b*) THE WORK TO BE DONE.

During the first year the work should comprise: (1) Careful drill upon pronunciation; (2) the memorizing and frequent repetition of easy colloquial sentences;

[1] In the spring of 1896 representatives of Harvard, Yale, Princeton, Columbia, Cornell, and the University of Pennsylvania met in New York and, in conference with representatives of a number of prominent Eastern preparatory schools, agreed upon a scheme of uniform requirements which has since been accepted by the institutions concerned. The modern-language conference framed an elementary and an advanced requirement in French and in German. The elementary requirement of the New York conference is substantially the same as that proposed by this committee, and their advanced requirement is nearly identical with our intermediate requirement. Slight differences appear in phraseology, in estimates of time required, and in the number of pages suggested for reading. But these differences are insignificant. It is believed therefore that the six prominent institutions which have already made so good a beginning in the unification of entrance requirements will have no difficulty in adapting their statements to the scheme which is here proposed for the country at large.

Digitized by Google

(3) drill upon the rudiments of grammar, that is, upon the inflection of the articles, of such nouns as belong to the language of every-day life, of adjectives, pronouns, weak verbs, and the more usual strong verbs, also upon the use of the more common prepositions, the simpler uses of the modal auxiliaries, and the elementary rules of syntax and word order; (4) abundant easy exercises designed not only to fix in mind the forms and principles of grammar, but also to cultivate readiness in the reproduction of natural forms of expression; (5) the reading of from 75 to 100 pages of graduated texts from a reader, with constant practice in translating into German easy variations upon sentences selected from the reading lesson (the teacher giving the English), and in the reproduction from memory of sentences previously read.

During the second year the work should comprise: (1) The reading of from 150 to 200 pages of literature in the form of easy stories and plays; (2) accompanying practice, as before, in the translation into German of easy variations upon the matter read, and also in the off-hand reproduction, sometimes orally and sometimes in writing, of the substance of short and easy selected passages; (3) continued drill upon the rudiments of the grammar, directed to the ends of enabling the pupil, first, to use his knowledge with facility in the formation of sentences, and, secondly, to state his knowledge correctly in the technical language of grammar.

(c) SUGGESTIONS TO THE TEACHER.

The following paragraphs are submitted in the interest of good teaching, and not in the interest of the most expeditious preparation for college. It is well known that a capable boy or girl can be crammed for a college examination in any subject in much less time than a proper training in the subject would require. Here, however, we are concerned with the proper training. The college entrance examination is admittedly an imperfect test of attainment in a modern language. Where candidates are numerous and the time limited, the examination is necessarily in writing; and then the only available test of the ability to read is the ability to translate, while pronunciation and readiness of speech are not tested at all. It is evident, then, that a good symmetrical training in the secondary school must keep in view more things than are likely to be "required" of the candidate at his examination for admission to college. In what follows we shall take up the more important points that are involved in the teaching of beginners and make some practical suggestions—suggestions that are by no means intended to prescribe a routine, but rather to state and explain guiding principles.

(1) *Pronunciation.*—It is hardly necessary to say that the first matter of importance for the beginner is the learning of a good pronunciation. Drill upon the subject should be kept up steadily and inexorably until right habits are firmly fixed; because wrong habits formed at the outset are very persistent and very difficult to correct. In attempting to imitate his teacher's utterance of the strange German sounds the learner will at first neither hear nor reproduce correctly, but will utter rough approximations of his own. It is necessary to train both his ear and his vocal organs. In doing this most teachers rely only upon oft-repeated imitations of their own pronunciation; and this is the best reliance, always supposing that the model itself be good. What usually happens, however, is that teachers cease or slacken their drill too soon. They find it dull business. After correcting some faulty utterance a score or two of times, they conclude that the result obtained will "do," that it is the best obtainable, that practice will make perfect—in the future. But the learner, being no longer regularly brought to book for his faults, perpetuates them, and makes no further progress except to pronounce badly with greater facility. In this way is acquired the slovenly pronunciation with which too many leave school.

The opinion is sometimes expressed that it is not worth while to take great

Digitized by Google

pains in the teaching of pronunciation, since perfection is out of the question. The argument is that American youth will not learn in school, however they may be taught, to pronounce German as Germans pronounce it; and that since they will speak badly anyway, the question of more or less can not greatly matter. But this is not the right attitude. For although one who is not a German will very rarely learn after childhood to use the organs of speech precisely as Germans use them, so that his pronunciation will ring absolutely true, still any boy or girl of average aptitude may by careful attention to the subject acquire a pronunciation so good that it will be pleasing rather than displeasing to a cultivated German ear; just as in the case of Germans learning English, that which is called the foreign "accent" may be reduced to such minute proportions that it does not offend, though it is noticeable. Now this is a result worth working for; but it can only be obtained when the teacher is interested in pronunciation and well-informed with regard to it. And right here comes in the great value of a knowledge of phonetics. Without such knowledge the teacher's only resource is the imitation of himself as model; his own personal habits of utterance become the standard of the class. But his habits may not be the best. If an American, he may have received a faulty training; if a German, he may have dialectic peculiarities which should not be taught to a class. One who knows just how the German sounds are produced, and how they differ from the English sounds with which they are most apt to be confounded, has a great advantage in teaching pronunciation. If he hears a faulty utterance he will know what is the matter and can correct it in the most effective way. If he knows something of German dialects, of provincial or local peculiarities of pronunciation, of the nature and claims of the so-called standard pronunciation, he will know what "correctness" means and will be able to teach more intelligently. And, what is most important of all, for one who has a scientific interest in pronunciation, the class-room drill upon the subject will not be a dull mechanical routine, but a highly interesting employment. He will himself learn much incidentally, and will make his teaching of pronunciation useful to his pupils, not only for German, but also for English.

It is therefore very much to be desired that teachers of German in the secondary schools be qualified to deal scientifically with the subject of pronunciation. For this purpose it is not at all necessary that they be accomplished phoneticians. A very rudimentary knowledge of general phonetics will suffice. Of greater importance is it to have at hand and to have carefully studied a good treatment of the special problems of German-English phonetics.[1]

(2) *The memorizing of colloquial sentences.*—If there is any point upon which progressive teachers of living languages the world over have lately been coming to an agreement, it is that in any course of study making the slightest pretension to thoroughness the proper starting point in teaching is the vocabulary and phraseology of the language as represented in its every-day forms of expression. It is of course possible to learn to read a language with some facility and still not be

[1] Such a treatment can be found in Hempl's German Orthography and Phonology, Boston, 1897. The second "book" of Professor Hempl's work gives, in chapter 1, a sufficient introduction to general phonetics, with bibliography on p. 61; then, in chapter 2, a scientific description of German speech sounds. Chapter 3 discusses such topics as "A standard of pronunciation," "Stage pronunciation," "The best German," "The difference between German and English pronunciation," and, very fully, "The values of the letters." Bibliography, on p. 107. From the works there mentioned we select, as likely to be most useful to the teacher (aside from Professor Hempl's own book): Grandgent's German and English Sounds, Boston, 1892; Brandt's German Grammar (second part), Boston, 1888; Vietor's German Pronunciation, 4th ed., 1890 (Lemcke & Büchner, 812 Broadway, New York, American agents); also Vietor's German essays, Die Aussprache des Schriftdeutschen, 1890, and Wie ist die Aussprache des Deutschen zu lehren? 1893. It is hardly necessary to say that the most widely used school grammars deal very briefly and superficially with the subject of pronunciation and are an insufficient reliance, even when free from positive error.

Digitized by Google

able to utter a sentence in it intelligibly or to understand a sentence uttered by another; in short, without acquiring any feeling for the language in its characteristic modes of expression. Scholars and men of science who find it necessary in their work to read a number of foreign languages can very quickly, by the aid of grammar, dictionary, and translation, reach a point at which they can "make out the sense" or "get the drift" of an article or a pamphlet. But this is not learning the language any more than "picking up" a few tunes on the piano is learning music. Such reading, though better than nothing and useful for certain purposes, is unsatisfactory. In the field of belles-lettres, where so much depends upon style, upon niceties of expression, and the subtle association of ideas, it is extremely unsatisfactory. The school, in dealing with languages so important as German and French, should aim at something better. It should aim to be thorough; to begin in the best way and lay a good foundation.

For literary appreciation—that is, for reading of the most profitable kind—one needs before all things a sensitive feeling for the language. One needs the sense of being at home in it. In teaching, this principle should be recognized from the outset. The learner's knowledge is to be made second nature. His faculties and organs must be taught to respond instantly and naturally to the foreign symbols whether they are seen or heard. Idea and form of expression must become so intimately associated that the one suggests the other without any intervening process of ratiocination. To accomplish this, there is no kind of drill so good as the memorizing and frequent repetition of easy colloquial sentences. Such sentences can be given out and learned without any attempt at grammatical analysis and quite in advance of the pupil's grammatical knowledge. To know the meaning of "es thut mir leid" and be able to handle the sentence appropriately, it is not at all necessary that one be able to parse a single one of the words. It is to be borne in mind that psychologically the unit of speech is the sentence or the phrase, and not the individual vocable. Thoughtful teachers sometimes object to this form of drill on the ground that it is mere memory work, that it does not teach the pupil to think or to reason. This, however, is not a valid objection. Such drill does much more than to load the memory. It develops aptitude by making psychological reactions instantaneous; in short, by creating Sprachgefühl. Its value has some analogy to that of the finger-exercises of the incipient pianist.

It is obviously important that what is given out to be learned in this way should consist of nothing but natural, oft-recurring forms of expression. The pupil is to learn how Germans actually say things, and not how they might possibly say something which no one would ever have occasion to say outside the class room. The ideal condition is, of course, that the teacher have such a command of colloquial idiom that he will be able to furnish the necessary materials from the resources of his own knowledge. It will then be best that the pupil's repetitions be elicited by questions addressed to him in German; in other words, that the drill take the form of short dialogues without use of English. But, as we have already intimated, the teacher who does not command the language should not attempt this, but follow a book or note down suitable sentences from his reading of realistic stories and plays. Such sentences may then be given out to be learned and repeated frequently, the teacher giving the thought in English.[1]

[1] For reasons sufficiently obvious the committee does not undertake to recommend particular American text-books for class use. There are a number of publications from which material more or less suitable can be culled. The test in choosing is whether a sentence represents (1) a natural and (2) a usual or oft-recurring form of expression. A scientific manual of spoken German, on the general lines perhaps of Sweet's Elementarbuch des gesprochenen Englisch, is a desiderandum. Worthy of recommendation for its thorough trustworthiness in respect of idiom, and equally good for German and French, is the German edition of Storm's Dialogues français, i. e., Französische Sprechübungen, Leipzig, 1888. For an excellent theoretical discussion of colloquial German, containing many useful hints to the teacher, we call attention to Wunderlich's Unsere Umgangsprache, Weimar, 1894.

This is perhaps an appropriate place to say a word upon the subject of memorizing poetry, a kind of drill which is highly thought of and largely practised by many teachers. The argument in its favor generally takes some such form as this: Boys and girls are apt to memorize easily, and they must memorize something; then why not have them memorize gems of poetry and great thoughts of great writers rather than the banalities of ordinary discourse? But this argument is fallacious. The object of the drill in colloquial German is, as we have already remarked, not to load the memory with things supposed to be highly valuable in themselves, but to create an instinctive feeling for the language in its usual and natural modes of expression. Now poetry, as the language of emotion, is a more or less artificial—often a highly artificial—form of expression, and it is better that the natural become lodged in the mind first. The beginner who has learned to recite "Sah ein Knab ein Röslein stehn, Röslein auf der Heiden," is hardly in a better, but rather in a worse, position for learning how a German would ordinarily express that idea. It may further be remarked that in simply hearing recitations of poetry in the class room the teacher can be of little use except to see that his pupils have done their task, which is, to make the best of it, one of his lowest functions; to correct mistakes of pronunciation, and to give points in elocution, if his talent runs in that direction. It is an easy business for him, but it is apt to involve a great waste of valuable time for all except the reciter. Finally, it is not to be forgotten that this kind of exercise, if it is felt as an irksome task, may easily create a positive distaste instead of a liking for the gems of poetry. We must remember Lord Byron's pathetic exclamation:

Then farewell Horace, whom I hated so.

To sum up, we would not be understood as condemning altogether the exercise of memorizing poetry, but we have not thought it of sufficient importance to deserve a place in the scheme of work outlined above. At any rate, it should not be made much of in the early stages. The poems given out for committing to memory should be few and short and selected with reference to their simplicity and naturalness of expression. The teacher who omits the exercise altogether during the first year will make no great mistake. The recitation of well-chosen dialogues, with the parts assigned, is a better exercise, and we believe is usually found more interesting to learners.

(3) *Grammar.*—It is assumed that simple exercises in colloquial German will begin with the very first lesson and take a portion of each recitation period, even when the pupil is learning the alphabet and becoming familiar with the values of the letters. It goes without saying that the sentences learned should occasionally be written down as well as often repeated orally. Practice in writing German from dictation is helpful in learning to spell, and should be kept up for some time. It may, however, be discontinued earlier than in case of French, because German spelling is much easier to learn than French.

Whether the script letters should be learned at the same time with the print letters and regularly used in all written work is a question upon which opinions differ. On the one hand, it is urged that the script letters are not at all difficult to master, and that the use of them facilitates learning to spell. Such spelling as *musz*, *müssen*, *Herz*, *sitzen*, and others, come more easily in the German than in the Roman script. It is also urged that, as Germans use the script in their ordinary writing, those who are studying the language should learn to use it. The opposing arguments are that there is nothing educational or practically useful about learning to write the German script; that for Americans it is quite sufficient to be able to read it, in case they should some time get a letter written in it; that boys and girls of high-school age have usually formed their hand in English, and that, unless great pains be taken with them at the start—that is, unless the teacher be both able and willing to teach penmanship for its own sake—they are almost

Digitized by Google

sure to learn to write the script in an ugly un-German hand, like nothing ever met with outside the class room. From this it is clear that there is something to be said upon both sides. Upon the whole, the committee are of the opinion that the use of the German script in the schools should not be regarded as a matter of great importance and should never be required at a college examination. Teachers who write it well and are willing to take the time to teach it well may very properly insist upon it. Others will be upon safe ground if they permit the use of the Roman letters in all written work. In that case, however, they should sooner or later give their pupils some practice in reading German handwriting.

It is assumed that learners who are of high-school age will take up the study of grammar after a few preliminary lessons. But for several weeks the grammar lessons should be short and easy, so as to allow an abundance of time each day for colloquial exercises and drill upon pronunciation. As the course proceeds the study of grammar and the doing of exercises directly related to the study of grammar may properly be allowed to absorb an increasing portion of the time, but the colloquial practice should be kept up. In the teaching of grammar the most important principle to be kept in view is that the grammar is there for the sake of the language and not the language for the sake of the grammar. The recitation of paradigms, rules, and exceptions is always in danger of degenerating into a facile routine in which there is but little profit. The important thing is not that the learner should acquire facility in telling off paradigms, quoting statements, and explaining principles according to the book, but that he should acquire facility in understanding and using the language. The maxim should be: Little theory and much application. It is of small use to be able to state correctly the principle of adjective declension, so long as the pupil, in attempting to apply the principle in a simple case, is obliged to stop and think, to recall his grammar, and perhaps to guess after all. The right forms must be so bred into the blood that they come naturally from tongue and pen. This, of course, requires an endless amount of repetition, which may at times become tedious. But the time spent upon this elementary drill is well spent and tells for good throughout the course. Teachers should not be in too great haste to get to reading good literature.

The first difficulty of practical importance in teaching German grammar relates to the gender and declension of nouns. If the attempt is made to master the gender and declension of every noun that is met with, either progress will be very slow (as in case of German children learning the mother tongue), or the learner's memory soon becomes overtaxed. Trying to remember everything, he soon ceases to remember anything with absolute confidence. The best way to deal with this difficulty is to concentrate attention from the start upon those nouns that belong to the language of everyday life—the names of familiar objects, relationships, and ideas—to make sure of these and let the others go. A list of such nouns can be made out which need not contain more than, say, 300 words. The pupil who at the end of a two years' course has really learned that number of nouns, so that the right gender and the right plural come to him instantly, has done quite enough. More should not be expected by the college examiner, so far as concerns those nouns the gender and declension of which can not be determined by inspection. It is of course assumed that the candidate will know about nouns in *chen*, *lein*, *ei*, *heit*, *keit*, *in*, *schaft*, *ung*. Whether he knows any other rules for gender is not very important.

After the inflection of the noun the other grammatical topics that require the most attention are the inflection of the adjective, the forms of the strong verbs and modal auxiliaries, the use of prepositions, and the subject of word order. In dealing with these and the minor difficulties of German grammar it is customary to rely, first, upon grammatical exercises—that is, the translation from German into English and from English into German of collections of sentences devised or selected for the express purpose of illustrating some grammatical point; and, sec-

Digitized by Google

ond, upon drill connected with the German reading lesson. Both these resources are good if properly handled, and neither should be neglected. To do its proper work the grammatical exercise should not be simply worked through once and then dismissed, but reviewed and repeated until the right forms come instantly from tongue and pen. From this it follows that the sentences of the grammatical exercise, no less than those learned in colloquial practice, should represent natural forms of expression—things that Germans say or might say under easily supposable conditions. It used to be thought, and perhaps some teachers and text-book makers still think, that anything grammatical will do for teaching grammar. And so, perhaps, it will; but it is possible to teach the grammar at the expense of the language, and the language is what we are after.

To ask a learner to upset into alleged German such sentences as: "The pupils' coats and shoes are in the maids' hands," or "I give warm clothes and red apples to poor little children," is, to say the least, inexpedient. Instead of a help, it is a hindrance to the acquisition of a sensitive feeling for the language. Rather than exercise his wits upon the translation of such English into such German it were much better that the learner should do no English-German translation whatever, but simply read real German and learn the grammar by observation and appropriate drill. Perceiving rightly that the translation of bad exercises is a waste of time and positively harmful, some teachers have been led to the position that all English-German translation is out of place in a beginner's course. They argue that one should not be expected to translate into a language until he knows something about it, until he has a certain working capital in the way of vocabulary, phraseology, and linguistic feeling; that so long as he must look up his words in the vocabulary and painfully and faultily piece them together according to his understanding of the grammar, it is better for him to occupy himself with German produced by those who know the language. This reasoning is not altogether unsound, but properly applied it does not lead to the rejection of all English-German translation in the early stages of study. On the contrary, such translation is itself highly useful in acquiring that larger working capital which is desired. All that is necessary is to avoid difficult or independent translation. Throughout the elementary course the English-German translation should consist of little else than easy variations upon a German text already studied. The German text should furnish or suggest substantially all that the learner needs to know, previous acquirements being of course taken into consideration. Here the maxim should be: A great deal of the easy rather than a little of the difficult.

We come now to the subject of drilling upon the reading lesson. There are various kinds of questions that can be asked about a text, but three types are prominent in the practice of teachers. In the first type the questions call for the recitation of paradigms and rules and the explanation of grammatical principles. In the second type the questions call for the translation into German of English sentences based upon the text. In the third the object is to draw the pupil out and induce him to talk about what is said in the text. To illustrate, supposing the text in hand to be *Der See macht eine Bucht ins Land:*

(1) Decline *Der See.* What is the meaning of *die See?* Decline *die See.* Give the principal parts of *macht.* Inflect *macht* in the present indicative active. Give a synopsis of its tenses in the indicative, first person singular. Why is the accusative used after *in?* Decline *Land.* What is the difference between *Lande* and *Länder?*

(2.) How would you say in German: The lake is quiet. The sea is quiet. My home is on the lake. I see a ship on the sea. There are many lakes in Switzerland? Give the German for: I made. I have made. I shall make. What are you making? Paper is now made of wood. Would it do to say *eine Bucht im Lande?* How would you say: He is coming to land. I am going into the country. I live in the country. That is the case in all lands except the Netherlands?

Digitized by Google

(3.) *Was macht der See? Welcher See ist gemeint? Wo befindet sich dieser See? Von welchem Lande ist hier die Rede? Waren Sie je in der Schweiz? Was für eine Regierung hat die Schweiz?*

Now, the best teaching will make some use of all these types of drill questions, but more of the second than of the first or third. The objection to an exclusive or even a predominant use of the first is that it teaches the pupil to "rattle off" paradigms and rules, but not to understand or to use the language. Instead of learning to think in German, as the phrase is, he learns to think grammar in the terms of his text-book. Every college examiner is acquainted with the youth who will write *er hat gekommen* and then, on demand, give correctly the rule for the use of the auxiliaries of tense. What is needed in his case is not more practice in repeating the rule, but more practice in writing and saying *er ist gekommen*. The objection to an exclusive use of type 3 is that it does not specifically teach grammar at all. In types 1 and 2 the questions may, of course, be put in German instead of English. It is to be observed, however, that the German grammatical terms are rather difficult to learn and do not come under the head of "everyday forms of expression." The principal value of grammatical drill conducted in German is to teach the learner to handle the sentence. So far as the vocabulary is concerned he might better be learning something else.

(4). *Reading matter.*—In outlining the work of the elementary course we have recommended that, aside from the German-English exercises of the grammar, the reading matter of the first year consist of graduated texts from a reader. This is the usual practice, and it certainly has some argument in its favor. The advantage of a reader is that it offers variety, introduces the learner to different styles, and leads him gradually from that which is very easy to that which is more difficult. Some teachers, however, prefer to make no use of a reader, but to pass directly from the grammar to complete stories having some literary value. They urge that such reading is more interesting and profitable than the disconnected texts usually found in readers. Others, while approving the use of a reader, will prefer to drop it earlier than our scheme proposes, and to read at least one complete story during the first year. Questions of this kind are not very important; and there are no general principles on which to decide them. Teachers must decide according to the character of their classes. Fortunately there is now no lack of suitable material. We have several very good readers and a large number of *Märchen*, *Geschichten*, *Erzählungen*, and *Novellen*, published both separately and in collections, and all annotated for beginners.

In choosing from the mass of literature available for the second year the aim should be, of course, to find that which is interesting to the young, wholesome, well-written, and not too difficult. It is natural to begin with the fairy stories, or *Märchen*, in which Germany is so prolific, but pupils of high-school age should not be kept too long on a diet of *Märchen*. If, at the end of the elementary course, the pupil is to be able to read easy narrative prose at sight, it is necessary that he have practice in reading different styles. Lively, realistic narrative, with plenty of dialogue, is to be preferred. The German *Märchen* is apt to appear childish to American boys and girls. On the other hand teachers often complain that the most of the tales furnished by conspiring editors and publishers are more or less mawkish love tales, and they sigh for vigorous stories of adventure with the grand passion left out or made little of. This is a demand which future editors may well keep in view. Meanwhile we must remember that the Germans are a more sentimental people than the Americans, and that one of the objects for which we study German in school is to learn what the Germans are like.

Stories suitable for the elementary course can be selected from the following list:[1] Andersen's Märchen and Bilderbuch ohne Bilder; Arnold's Fritz auf Ferien;

[1] In all the reading lists the order is alphabetical. It expresses no opinion with regard to the merit of the texts as compared with one another.

Digitized by Google

Baumbach's Die Nonna and Der Schwiegersohn; Gerstäcker's Germelshausen; Heyse's L'Arrabbiata, Das Mädchen von Treppi, and Anfang und Ende; Hillern's Höher als die Kirche; Jensen's Die braune Erica; Leander's Träumereien, and Kleine Geschichten; Seidel's Märchen; Stökl's Unter dem Christbaum; Storm's Immensee and Geschichten aus der Tonne; Zschokke's Der zerbrochene Krug.

Good plays adapted to the elementary course are much harder to find than good stories. Five-act plays are too long. They require more time than it is advisable to devote to any one text. Among shorter plays the best available are perhaps Benedix's Der Prozesz, Der Weiberfeind, and Günstige Vorzeichen; Elz's Er ist nicht eifersüchtig; Wichert's An der Majorsecke; Wilhelmi's Einer musz heiraten. It is recommended, however, that not more than one of these plays be read. The narrative style should predominate. A good selection of reading matter for the second year would be Andersen's Märchen, or Bilderbuch, or Leander's Träumereien, to the extent of say forty pages. After that such a story as Das kalte Herz, or Der zerbrochene Krug; then Höher als die Kirche, or Immensee; next a good story by Heyse, Baumbach, or Seidel; lastly Der Prozesz.

A minor question which sometimes exercises the mind of the teacher is the question of the special vocabulary versus the dictionary. The obvious advantage of the special vocabulary is that it is very much more convenient for the learner. A well-known schoolman in writing to the committee upon this subject, sums up his views in the proposition that "dictionaries are a nuisance." Nor is it easy to find any valid pedagogical objection to the use of a properly prepared special vocabulary. The objection most often urged is that in using a special vocabulary the scholar does not learn, nor try to learn, what the word really means in and of itself, but only what it means in the context where he has found it. It is urged, therefore, that before he can become independent, and acquire scholarly habits of study, he must emancipate himself from the special vocabulary and learn to use the dictionary. There is some force in this argument, but not much; for what the learner invariably does in using the dictionary is to pick out, from the various meanings given, the particular one that suits his occasion. To the others he pays no attention. When he comes across the word in another sense, he looks it up again. It is thus a saving of time if he have the right meaning, unincumbered by the others, given him in a special vocabulary. Really the whole question is mainly one of saving time. If, in getting his lesson, the learner could have at his elbow someone who would simply tell him the meaning of the word, that would be better still, if he would but remember what he were told. But there is undoubtedly some truth in the principle that what is acquired with difficulty, that is, with exertion and exercise of judgment, is the more likely to be remembered. Meanings that come easily in footnotes are apt to go no less easily. The whole question is one upon which no fixed rules can be laid down. There is no serious objection to the use of special vocabularies throughout the elementary course, provided the right texts are available in editions provided with vocabularies, but the choice of reading matter should not turn primarily upon this consideration. It is best to provide a good course of reading, with variety, interest, and progression, even if, toward the end, the dictionary has to be used.

(5) *Translation into English; sight reading.*—In the majority of schools it would appear that, after the first few months, the study of German consists principally in the translation of German literature into English. Translation is the exercise which is felt by both teacher and pupil to be the most important, and it is the one, accordingly, which is most insisted upon. It is also the exercise most easily handled. To sit and hold a book while the members of the class translate, one after the other, into class-room English, to correct their more serious blunders, and help them to "get the sense," requires no great amount of preparation, no great expenditure of energy or ingenuity. But while it has its dangers, the profitableness of translation can not be successfully attacked. Whatever may be

Digitized by Google

true of very young children, one who already knows one language will learn another most "naturally," most expeditiously, and most thoroughly by means of comparison with his mother tongue; and this comparison, as was pointed out in a preceding section, is an important instrument of discipline and culture. Moreover, translation is the most effective and the most readily available means of determining whether the sense of a passage is exactly understood. It is the best detective of mental haziness, half-knowledge, and self-deception. At the same time it should not be forgotten that the principal object of study is not to learn to translate, but to learn to read without translating.

How to deal with translation so as to make neither too much nor too little of it, so as to get the good and escape the evil of it, is not a simple problem for the teacher. It is easy to say that good translation should always be insisted on, and that bad English should never be allowed to go uncorrected. As a counsel of perfection, this is no doubt good. The trouble is, however, that really good translation of real literature is an art requiring literary skill. There must be time for the mental balancing of alternatives, the testing of synonyms, etc. No one can do it offhand. To expect schoolboys or college students to do it in the ordinary routine of class work, is to expect impossibilities. On the other hand, slovenly, incorrect, and unidiomatic translation is worse than a waste of time. The young person who gets into the habit of murdering his mother tongue in cold blood, under the pretense of learning a foreign language, does himself more harm than good. What, then, is to be done? The practical answer would seem to be this: Between the extremes of atrocious English, which should not be endured, and the really good English, which is unattainable, there is a wide belt of what may be called tolerable English; English which is not excellent from a literary point of view, but is at least clear, grammatical, free from gross improprieties in respect to idiom, and reasonably faithful to the meaning of the original. Such tolerable English is all that can be expected in the ordinary routine of the class room. It is, however, desirable that the learner become aware that there is a higher ideal, and that he have some practice in trying to reach it. To this end a passage of German text should occasionally be given out for a carefully prepared written translation, with instructions to take time and make the work just as good as possible. Such translations should then be criticised by the teacher and compared with one another in the class. Attention should be called to the small points of idiom, arrangement, choice of words, turn of phrase, etc., which make up the difference between the tolerable and the excellent. In this way the pupil's literary sense will be cultivated; he will become familiar with the idea of translation as an art, and the effect will be to improve gradually the quality of his ordinary work.

The next question is: How long and to what extent should the routine translation of good German into tolerable English be insisted on in the class room? The answer is: So long as and wherever the teacher is uncertain whether the meaning of the original is understood. If there is complete certainty that the learner can translate his passage of German into tolerable English, it is, as a rule, not worth while to have him do it; the time can be used to better advantage. An exception may be made, of course, in the case of pupils who are for any reason unusually backward in their English, or for such as may be suspected of not preparing their lessons. But for capable pupils who have a right attitude toward their teacher and their work, there presently comes a time when the routine translation in class of what they have previously prepared ceases to be profitable. They learn no new German in the process, and they do not improve their command of English. For A, B, C, and D, who have prepared their lessons and know perfectly well how to translate a given passage, to sit in the class while E actually translates it means a waste of time. When that stage is reached it is time to drop the systematic translation of the entire lesson in class, to call only for the rendering

Digitized by Google

of words or passages that are liable to be misunderstood, and to use the time thus gained in some exercise more profitable than superfluous translation.

One such exercise is reading at sight. Since the general aim in the elementary course is to learn to read very easy narrative prose at sight and not to learn to translate any specified texts, and since the candidate for admission to college will probably be tested upon some text that he has never studied, it is evident that considerable practice should be given in sight reading. Teachers sometimes object to this exercise on the ground that it encourages guesswork and inaccuracy. But the objection is not valid. The object of the exercise is to increase the learner's vocabulary, to make him feel that he can read German that he has not previously studied and to give him facility in such reading. There is not the slightest objection to his guessing at the meaning of a new word. All our reading is largely a process of divination, and the better we can divine from the context the better we can read. Of course the wrong guesses must be corrected, and the teacher is there for that purpose. It is hardly necessary to say that for sight reading the very easiest texts that can be found should be chosen. Grimm's Märchen are well adapted for the earliest experiments, then Meissner's Aus meiner Welt or Volkmann's Kleine Geschichten.

(6) *Reproductive translation into German.*—It will be observed that the programme of work for the second year of the elementary course provides for practice "in the off-hand reproduction, sometimes orally and sometimes in writing, of the substance of short and easy selected passages." This is what the Germans call "freie Reproduktion," and is one of the most profitable exercises possible. It teaches the pupil to give heed not only to the meaning but to the form in which it is expressed, to put thoughts in German with German as a starting point. The language of the original should, of course, not be memorized verbatim; what is wanted is not an effort of the memory, but an attempt to express thought in German forms that are remembered in a general way but not remembered exactly. The objection to independent translation from English into German is that for a long time it is necessarily mechanical. The translator has no help except his dictionary and grammar. His translation is mere upsetting. In free reproduction, on the contrary, he instinctively starts from his memory of the original. His thoughts tend to shape themselves in German form. In short, he learns to think in German.

SECTION VIII.—THE INTERMEDIATE COURSE IN GERMAN.

(*a*) THE AIM OF THE INSTRUCTION.

At the end of the intermediate course the pupil should be able to read at sight German prose of ordinary difficulty, whether recent or classical; to put into German a connected passage of simple English, paraphrased from a given text in German; to answer any grammatical questions relating to usual forms and essential principles of the language, including syntax and word formation, and to translate and explain (so far as explanation may be necessary) a passage of classical literature taken from some text previously studied.

(*b*) THE WORK TO BE DONE.

The work should comprise, in addition to the elementary course, the reading of about 400 pages of moderately difficult prose and poetry, with constant practice in giving, sometimes orally and sometimes in writing, paraphrases, abstracts, or reproductions from memory of selected portions of the matter read; also grammatical drill upon the less usual strong verbs, the use of articles, cases, auxiliaries of all kinds, tenses and modes (with special reference to the infinitive and subjunctive), and likewise upon word order and word formation.

Digitized by Google

(c) SUGGESTIONS TO THE TEACHER.

The intermediate course is supposed to be the elementary course, plus one year's work at the rate of not less than four recitations a week. Suitable reading matter for the third year can be selected from such works as the following: Ebner-Eschenbach's Die Freiherren von Gemperlein; Freytag's Die Journalisten and Bilder aus der deutschen Vergangenheit, for example Karl der Grosse, Aus den Kreuzzügen, Doktor Luther, Aus dem Staat Friedrichs des Grossen; Fouqué's Undine; Gerstäcker's Irrfahrten; Goethe's Hermann und Dorothea and Iphigenie; Heine's poems and Reisebilder; Hoffmann's Historische Erzählungen; Lessing's Minna von Barnhelm; Meyer's Gustav Adolph's Page; Moser's Der Bibliothekar; Riehl's Novellen, for example, Burg Neideck, Der Fluch der Schönheit, Der stumme Ratsherr, Das Spielmannskind; Rosegger's Waldheimat; Schiller's Der Neffe als Onkel, Der Geisterseher, Wilhelm Tell, Die Jungfrau von Orleans, Das Lied von der Glocke, Balladen; Scheffel's Der Trompeter von Säkkingen; Uhland's poems; Wildenbruch's Das edle Blut. A good selection would be: (1) one of Riehl's novellettes; (2) one of Freytag's "pictures;" (3) part of Undine or Der Geisterseher; (4) a short course of reading in lyrics and ballads; (5) a classical play by Schiller, Lessing, or Goethe.

The general principles of teaching set forth in the preceding section apply also to the work of the intermediate course. Translation should be insisted upon so far as necessary, but the aim should be to dispense with it more and more. Every expedient should be employed which will teach the scholar to comprehend and feel the original directly, without the intervention of English. Occasional exercises in preparing very careful written translations should be continued. Practice should be given in reading at sight from authors of moderate difficulty, such as Riehl or Freytag. The "free reproduction" should by all means be kept up. It will be found much more valuable at this stage than independent translation of English into German. In dealing with classical literature thorough literary studies are, of course, not to be expected, but an effort should be made to bring home to the learner the characteristic literary qualities of the text studied, and to give him a correct general idea of the author.

SECTION IX.—THE ADVANCED COURSE IN GERMAN.

(a) THE AIM OF THE INSTRUCTION.

At the end of the advanced course the student should be able to read, after brief inspection, any German literature of the last one hundred and fifty years that is free from unusual textual difficulties, to put into German a passage of simple English prose, to answer in German questions relating to the lives and works of the great writers studied, and to write in German a short, independent theme upon some assigned topic.

(b) THE WORK TO BE DONE.

The work of the advanced course (last year) should comprise the reading of about 500 pages of good literature in prose and poetry, reference reading upon the lives and works of the great writers studied, the writing in German of numerous short themes upon assigned subjects, independent translation of English into German.

(c) SUGGESTIONS TO THE TEACHER.

Suitable reading matter for the last year will be: Freytag's Soll und Haben; Fulda's Der Talisman; Goethe's dramas (except Faust) and prose writings (say extracts from Werther and Dichtung und Wahrheit); Grillparzer's Ahnfrau or Der Traum ein Leben; Hauff's Lichtenstein: Heine's more difficult prose (for example, Über Deutschland); Kleist's Prinz von Homburg; Körner's Zriny; Les-

Digitized by Google

sing's Emilia Galotti and prose writings (say extracts from the Hamburgische Dramaturgie or Laokoon); Scheffel's Ekkehard; Schiller's Wallenstein, Maria Stuart, Braut von Messina, and historical prose (say the third book of the Geschichte des dreiszigjährigen Krieges); Sudermann's Johannes; Tieck's Genoveva; Wildenbruch's Heinrich.

A good selection from this list would be: (1) A recent novel, such as Ekkehard or Soll und Haben, read not in its entirety, but in extracts sufficient to give a good idea of the plot, the style, and the characters; (2) Egmont or Götz; (3) a short course of reading in Goethe's prose (say the Sesenheim episode from Dichtung und Wahrheit); (4) Wallenstein's Lager and Wallenstein's Tod, with the third book of the Thirty Years' War; (5) Emilia Galotti; (6) a romantic drama, such as Genoveva or Der Prinz von Homburg. It is assumed that by the time the fourth year is reached, if the preceding instruction has been what it should be, translation in class can be largely dispensed with and the works read somewhat rapidly. Of course they can not be thoroughly studied, but thorough literary study belongs to the college or the university. It is not sound doctrine for the secondary school that one work studied with the painstaking thoroughness of the professional scholar is worth half a dozen read rapidly. In the secondary school the aim should be to learn to read easily, rapidly, and yet with intelligent, general appreciation, somewhat as an ordinary educated American reads Shakespeare. Such a person in reading Shakespeare will find much that he does not fully understand, archaic phrases, obscure allusions, etc. If he were to work out all these things in the manner of a scholar, and go deeply into the literary, historical, and psychological questions involved in a single one of Shakespeare's great plays, it would take a very long time. Nevertheless, he can read the play intelligently in a few hours. An editor's note helps him quickly over the graver difficulties, and when he is done he has a good general idea of the work, and has been greatly profited by the reading of it.

The other lines of work suggested for the advanced course appear to require no further comment. They explain themselves, and grow naturally out of what has gone before.

SECTION X.—THE ELEMENTARY COURSE IN FRENCH.

(*a*) THE AIM OF THE INSTRUCTION.

At the end of the elementary course the pupil should be able to pronounce French accurately, to read at sight easy French prose, to put into French simple English sentences taken from the language of everyday life, or based upon a portion of the French text read, and to answer questions on the rudiments of the grammar as defined below.

(*b*) THE WORK TO BE DONE.

During the first year the work should comprise: (1) Careful drill in pronunciation; (2) the rudiments of grammar, including the inflection of the regular and the more common irregular verbs, the plural of nouns, the inflection of adjectives, participles, and pronouns; the use of personal pronouns, common adverbs, prepositions, and conjunctions; the order of words in the sentence, and the elementary rules of syntax; (3) abundant easy exercises, designed not only to fix in the memory the forms and principles of grammar, but also to cultivate readiness in the reproduction of natural forms of expression; (4) the reading of from 100 to 175 duodecimo pages of graduated texts, with constant practice in translating into French easy variations of the sentences read (the teacher giving the English), and in reproducing from memory sentences previously read; (5) writing French from dictation.

Digitized by Google

During the second year the work should comprise: (1) The reading of from 250 to 400 pages of easy modern prose in the form of stories, plays, or historical or biographical sketches; (2) constant practice, as in the previous year, in translating into French easy variations upon the texts read; (3) frequent abstracts, sometimes oral and sometimes written, of portions of the text already read; (4) writing French from dictation; (5) continued drill upon the rudiments of grammar, with constant application in the construction of sentences; (6) mastery of the forms and use of pronouns, pronominal adjectives, of all but the rare irregular verb forms, and of the simpler uses of the conditional and subjunctive.

Suitable texts for the second year are: About's Le roi des montagnes, Bruno's Le tour de la France, Daudet's easier short tales, De la Bédollière's La Mère Michel et son chat, Erckmann-Chatrian's stories, Foa's Contes biographiques and Le petit Robinson de Paris, Foncin's Le pays de France, Labiche and Martin's La poudre aux yeux and Le voyage de M. Perrichon, Legouvé and Labiche's La cigale chez les fourmis, Malot's Sans famille, Mairet's La tâche du petit Pierre, Merimée's Colomba, extracts from Michelet, Sarcey's Le siège de Paris, Verne's stories.

(*c*) SUGGESTIONS TO THE TEACHER.

The suggestions already offered upon the teaching of elementary German are, in the main, equally applicable to the teaching of elementary French. While each language has its own peculiar difficulties that require special attention from the teacher, the general principles that should regulate the work are the same for both. To avoid needless repetition we refer the reader back to what is said in Section VII, *c*, and content ourselves here with adding a few further observations which may be regarded as supplementary.

The educational value of the study of French in cultivating habits of careful discrimination, of mental alertness, of clear statement, must never be lost from view, and the expediency of an exercise must often be determined by its utility in attaining these ends. The knowledge gained in the secondary school alone can rarely be of immediate commercial value, but it should be a most serviceable foundation for later acquirements, and the advocates of oral methods may fairly lay some stress on this consideration. The demand for more spoken French in the class room rests chiefly, however, on other grounds, which may be summarized as follows:

(1) Tongue and ear are most efficient aids to the memory, and he who depends on eye alone deprives himself of indispensable allies.

(2) Oral work gives vivacity to the class, stimulates the pupil by active participation, and encourages him by making him feel that he is gaining a practical command of the language.

(3) In reproducing French sentences several can be spoken in the time needed to write one.

(4) The hearer is compelled to grasp the sentence as a whole, while the reader is apt to dwell on separate words, distorting and often reversing the sense, which can only be obtained by making the sentence the unit of thought and interpreting each word in the light of its relation to its fellows.

(5) The rapidity of speech also conduces to grasping thought directly from the French with no intermediate English. Many readers really read only the English into which, more or less laboriously, they change the French words. It is needless to dwell on the fact that such readers get their entire thought from a translation, usually a very bad one, and can never have any exact perception of literary excellence in French nor distinguish shades of meaning different from those to which they have been accustomed in English. It is hard to see how such a one can have any vivid conception of a lyric, an oration, or a dialogue; nor can he understand how, when translation is required, the proper order is French-thought-English, and not French-English, with the thought last or never.

Digitized by Google

On the other hand, that time may be economically used, rambling, aimless talking must not be tolerated in the class room; and a teacher who does not possess a good pronunciation and a ready command of the language generally does far more harm than good by practising on his pupils. Whatever recommendations the committee has made as to oral work apply only to those teachers who can speak French well.

Especially with beginners should the French spoken be accurately pronounced. Faults of pronunciation once fixed are very difficult to eradicate. In some places French has been introduced into grades below the high school, and the classes intrusted to teachers unable to pronounce well. Irreparable injury has thus been done. The utmost pains must be taken at the beginning, especially with the vowels; and the separate sounds, and words containing them, should be pronounced many times by the teacher and repeated by the pupil. For a long time every new word should thus be treated, and unless a phonetic text is used the pupil should always hear a new word before he tries to pronounce it.

Careful memorizing and frequent repetition of a few lines of simple prose are helpful and furnish a standard of pronunciation to which new words may be referred. Both for this and for mastering colloquial and idiomatic expressions, word order, and grammatical forms, it is advised that a small amount of French, preferably simple prose, be carefully memorized the first year. Later, selections may be made for their literary interest.

Most teachers know how they prefer to teach the rudiments of grammar in a given class. We may remark, however, that it is not for the secondary school to spend time over the many pages of exceptions, peculiarities in gender and number, idioms that one rarely sees and never thinks of using, and grammatical puzzles for which each learned grammarian has a different solution, that form so large a part of some grammars. The great universals, however (the regular and the common irregular verbs; negative and interrogative variations; the common use and meaning of moods and tenses; the personal pronouns and their position; the general principles governing the agreement of adjectives, pronouns, and participles; the partitive constructions; the possessives, demonstratives, interrogatives, and relatives; the most common adverbs, conjunctions, and prepositions), should all be thoroughly understood by the end of the second year of high-school study, and subsequent study should give considerable facility in using them.

The verb seems most formidable; but when it is perceived that most forms of all verbs may be treated as identically derived from the "primitive tenses," the difficulties appear less numerous, and when the principle of stem differentiation under the influence of tonic accent, persisting in the older and more common verbs, is a little understood, the number of really unique forms is inconsiderable.

Translating into English should mean giving in well-chosen language the exact thought and spirit of the original. Thus understood, it is extremely difficult, and should never be attempted by the pupil before the meaning of the original is clear to him. It is then rather an exercise in English than in French. Nothing should be accepted as English which is not English. The teacher who complacently listens while a pupil turns good French into bad English is, to put it mildly, not doing his duty. Translating into English is often the most rapid means of ascertaining whether the pupil has correctly understood the French read, but a few well-chosen questions asked and answered in French, or an abstract in the same language, is often equally effective as a test, and far better as training in French.

Just as English should be English, French should be French; and merely using French words and conforming to grammatical rules do not make a sentence French. At first, sentences formed by pupils should exactly follow French model sentences, being either verbatim reproductions or differing only in simple and immaterial verbal changes. Not until the pupil, by much assimilation of French

Digitized by Google

models, has become imbued with the form and spirit of the language, can he be safely left to his own invention. In choosing reading matter, the tendency is to select something too hard. The teacher adopts a book because it is world-renowned, because it interests him personally, because it teaches a valuable lesson, moral or historical. While all pedagogical roads should lead to the Rome of a broad culture, the attempt to teach literature, æsthetics, history, or morality from a work in which linguistic difficulties dismay the pupil and engross his attention, can only end in making him detest both the book and its lessons. The beginner in French can be taught these things best in the vernacular; while searching a dictionary to discover whether *fut* comes from *faire* or from *falloir*, he has little leisure to think of the relative merits of literary schools. Give him at first the easiest reading attainable, remembering that simple language does not mean infantile conceptions nor vice versa. Entertain no thought of teaching literature until the pupil is quite familiar with ordinary prose and can read page after page of the text assigned with no great need of grammar or dictionary. The classics of dramatic literature may very properly be postponed until the fourth year, and we do not consider them always desirable even then; but a few have been given among texts suitable for the third year in the hope that these rather than others will be selected by teachers who, for reasons of their own, choose to read something of the kind at this stage of the course.

The reading lists are meant to be illustrative simply, not exhaustive. Other texts equally good might no doubt be mentioned under each head. The answers to the committee's circulars indicate clearly that teachers would not welcome a narrow range of prescribed reading, such as teachers of Latin have in their Cæsar, Cicero, and Virgil. A definite curriculum of that kind would no doubt have its advantages, but in the case of the modern languages it is not practicable and, upon the whole, not desirable. The disadvantages would far outweigh the advantages. The mass of available literature is so great, the preferences of teachers and the needs of classes so divergent, that the only safe course is to leave a large latitude of choice. This being so, it has seemed best merely to give examples of the kind of reading appropriate to each year.

SECTION XI.—THE INTERMEDIATE COURSE IN FRENCH.

(*a*) THE AIM OF THE INSTRUCTION.

At the end of the intermediate course the pupil should be able to read at sight ordinary French prose or simple poetry, to translate into French a connected passage of English based on the text read, and to answer questions involving a more thorough knowledge of syntax than is expected in the elementary course.

(*b*) THE WORK TO BE DONE.

This should comprise the reading of from 400 to 600 pages of French of ordinary difficulty, a portion to be in the dramatic form; constant practice in giving French paraphrases, abstracts, or reproductions from memory of selected portions of the matter read; the study of a grammar of moderate completeness; writing from dictation.

Suitable texts are: About's stories; Augier and Sandeau's Le Gendre de M. Poirier; Béranger's poems; Corneille's Le Cid and Horace; Coppée's poems; Daudet's La Belle-Nivernaise; La Brète's Mon Oncle et mon curé; Madame de Sévigné's letters; Hugo's Hernani and La Chute; Labiche's plays; Loti's Pêcheur d'Islande; Mignet's historical writings; Molière's L'Avare and Le Bourgeois gentilhomme; Racine's Athalie, Andromaque, and Esther; George Sand's plays and stories; Sandeau's Mademoiselle de la Seiglière; Scribe's plays; Thierry's Récits

Digitized by Google

des Temps mérovingiens; Thiers's L'Expédition de Bonaparte en Egypte; Vigny's La canne de jonc; Voltaire's historical writings.

SECTION XII.—THE ADVANCED COURSE IN FRENCH.

(*a*) THE AIM OF THE INSTRUCTION.

At the end of the advanced course the pupil should be able to read at sight, with the help of a vocabulary of special or technical expressions, difficult French not earlier than that of the seventeenth century; to write in French a short essay on some simple subject connected with the works read; to put into French a passage of easy English prose, and to carry on a simple conversation in French.

(*b*) THE WORK TO BE DONE.

This should comprise the reading of from 600 to 1,000 pages of standard French, classical and modern, only difficult passages being explained in the class; the writing of numerous short themes in French; the study of syntax.

Suitable reading matter will be: Beaumarchais's Barbier de Séville; Corneille's dramas; the elder Dumas's prose writings; the younger Dumas's La Question d'argent; Hugo's Ruy Blas, lyrics, and prose writings; La Fontaine's fables; Lamartine's Graziella; Marivaux's plays; Molière's plays; Musset's plays and poems; Pellissier's Mouvement littéraire au XIX^{e} siècle; Renan's Souvenirs d'enfance et de jeunesse; Rousseau's writings; Sainte-Beuve's essays; Taine's Origines de la France contemporaine; Voltaire's writings; selections from Zola, Maupassant, and Balzac.

SECTION XIII.—SPECIMEN EXAMINATION PAPERS FOR ADMISSION TO COLLEGE.

The complaint is sometimes heard from teachers in the secondary schools—and investigation shows it to be not altogether groundless—that even at colleges having the same or very similar requirements for admission the entrance examinations are apt to differ not a little in respect to difficulty and in respect to the general character of the questions asked. To a certain extent this lack of uniformity is inevitable. With the best intentions examiners will differ more or less in their estimate of difficulty and in their choice of test questions. Some will prefer to set a more difficult paper and mark liberally; others to set an easier paper and mark more closely. The only obvious way to bring about uniformity in the papers set would be to intrust the preparation of them each year to a central committee or bureau (say of the Modern Language Association), which should furnish them on demand, in sealed packages and at a fixed rate, to such colleges as might wish to receive them. Such a plan would clearly have much in its favor. Under its operation there would be no room for criticism of particular colleges. The papers would presumably be prepared with very great care; they would improve in the light of criticism, would furnish teachers with a pattern to work by, and so could hardly fail to make for greater excellence and uniformity in the work of our secondary schools. The feasibility of such a plan would depend largely upon the attitude of the colleges, and whether it would work well in practice could only be determined by trial. Difficulties of one kind and another would no doubt arise, but they do not appear in advance to be insuperable. At any rate, the plan seems worthy of serious consideration.

Meanwhile, without wishing to imply an exclusive preference for a written as opposed to an oral test (the best plan, wherever practicable, is undoubtedly a combination of the two), the committee have thought it appropriate to close this report with a series of papers designed to illustrate in a general way the kind of test

Digitized by Google

which, in our opinion, the candidate for admission to college may reasonably be expected to pass upon completing any of the courses above described. The papers are by no means offered as perfect models for imitation, but as an approximate indication of what, in our judgment, the college entrance examination should be. The time required is estimated in each case at about two hours. Unless the contrary is expressly stated, the texts are not supposed to have been previously studied by the candidate.

A.—ELEMENTARY FRENCH.

I. Translate into English:

(*a*) Lui, penché sur sa chaise, regardait dans la cheminée, les yeux fixes. Et tout à coup, comme on se taisait, il se tourna de mon côté et me dit d'un ton de bonne humeur:

Voici bientôt le printemps, monsieur Florence, nous ferons encore plus d'un bon tour dans la montagne; j'espère que cette année vous viendrez plus souvent, car vous avez beau dire, vous aimez ce pays autant que moi . . .

Hé! je ne dis pas le contraire, Georges: mais à ton âge, dans ta position . . . Enfin laissons cela . . . Et puisque tu restes, eh bien, oui, tu as raison, nous irons plus souvent nous promener ensemble dans la montagne; je suis toujours content d'être avec toi.

À la bonne heure, dit-il en riant, voilà ce qui s'appelle parler.

Et durant plus d'une demi-heure, la conversation roula sur les fleurs de nos montagnes, sur la belle vallée de la Sarre-Rouge, etc. On aurait cru que rien d'extraordinaire ne s'était dit.—ERCKMANN-CHATRIAN.

(*b*) Le temps était sombre, il tombait une petite pluie de brouillard qui épaississait encore l'obscurité, les becs de gaz brûlaient mal, et leur lumière, réfléchie par les flaques d'eau, éclairait la rue déserte d'une façon incertaine et changeante. Le jeune homme marchait rapidement, son parapluie baissé en avant pour s'abriter de la pluie qui lui frappait dans la figure. Tout à coup, sans qu'il les eût vus venir ou sortir d'une embrasure de porte, il se trouva en face de deux hommes et, surpris de cette brusque apparition, il sauta de côté par un mouvement instinctif et nerveux. Il était à ce moment à une centaine de mètres de chez lui, à l'encoignure d'une ruelle qui descend vers la rue de Charenton.—MALOT.

(*c*) Un jeune homme plein de passions, assis sur la bouche d'un volcan, et pleurant sur les mortels dont à peine il voyait à ses pieds les demeures, n'est sans doute, ô vieillards! qu'un objet digne de votre pitié; mais quoi que vous puissiez penser de René, ce tableau vous offre l'image de son caractère et de son existence: c'est ainsi que toute ma vie j'ai eu devant les yeux une création à la fois immense et imperceptible, et un abîme ouvert à mes côtés.—CHATEAUBRIAND.

II. (*a*) Write the five principal parts of the three verbs (the forms here given occur in I, *b*): *vus, sortir, descend.*

(*b*) Write a synopsis of the conjugation (first person singular of each tense) of *se réjouir* and *savoir.*

(*c*) Write the inflection of: the present indicative of *boire* and *faire;* the future of *pouvoir;* the present subjunctive of *prendre.*

(*d*) Write the forms of the demonstrative pronouns.

(*e*) In what ways may the use of the passive voice be avoided in French?

III. Translate into English:

(*a*) Here is the pen, shall I send it to her? No; do not send it to her; give it to me.

(*b*) Cats and dogs are domestic animals.

(*c*) You must give them some white bread and good coffee, if they have none.

(*d*) The old man is very well this evening, although he has worked all day.

(*e*) We have just searched for your gloves, but we do not find them in the room where you left them a quarter of an hour ago.

Digitized by Google

(*f*) Why do we weep for mortals whose life and character we scarcely know? We always have them before our eyes. Whatever we may think of them, they are surely worthy of our pity. (See I, c.)

B.—INTERMEDIATE FRENCH.

I. Translate into English:

(*a*) Nulle part, à aucune époque de ma vie, je n'ai vécu aussi complètement seul. La maison était loin de la route, dans les terres, écartée même de la ferme dépendante dont les bruits ne m'arrivaient pas. Deux fois par jour, la femme du fermier me servait mon repas, à un bout de la vaste salle à manger dont toutes les fenêtres, moins une, tenaient leur volets clos. Cette Provençale noire, le nez écrasé comme un Cafre, ne comprenant pas quelle étrange besogne m'avait amené à la campagne en plein hiver, gardait de moi une méfiance et une terreur, posait les plats à la hâte, se sauvait sans un mot, en évitant de tourner la tête. Et c'est le seul visage que j'aie vu pendant cette existence, distraite uniquement, vers le soir, par une promenade dans une allée de hauts platanes, à la tristesse d'un soleil froid et rouge dont les grenouilles saluaient le coucher hâtif de leurs discordantes clameurs.—DAUDET.

(*b*) Amis, loin de la ville,
Loin des palais de roi,
Loin de la cour servile,
Loin de la foule vile,
Trouvez-moi, trouvez-moi,

Aux champs où l'âme oisive
Se recueille en rêvant;
Sur une obscure rive
Où du monde n'arrive
Ni le flot, ni le vent,

Quelque asile sauvage,
Quelque abri d'autrefois,
Un port sur le rivage,
Un nid sous le feuillage,
Un manoir dans les bois!

Trouvez-le moi bien sombre,
Bien calme, bien dormant,
Couvert d'arbres sans nombre,
Dans le silence et l'ombre
Caché profondément!

—V. HUGO.

(*c*) DENISE. Fernand?

FERNAND. Qu'est-ce que tu veux?

DENISE. Où as-tu mis le livre que tu as été chercher pour mademoiselle de Bardannes?

FERNAND. Là, sur la table. Est-ce qu'elle est déjà prête?

DENISE. Pas encore, mais elle achève de s'habiller. *Elle prend le livre sur la table.*

ANDRÉ, *entrant, à Denise.* Je n'ai pas pu vous demander tout à l'heure, devant tout ce monde, mademoiselle, si vous êtes tout à fait remise de votre indisposition d'hier qui vous a empêchée de dîner avec les amis qui me sont arrivés, dont deux sont déjà des vôtres. J'espère que ce soir j'aurai le plaisir et l'honneur de vous voir à notre table, ainsi que monsieur et madame Brissot.

DENISE. Oui, monsieur, ma mère m'a déjà fait part de votre aimable invitation.

FERNAND, *à André.* Et moi, je vais monter un peu d'avance le cheval de ta sœur pour le bien mettre à sa main; montes-tu avec nous?

ANDRÉ. Non, nous avons une inspection à faire avec M. Thouvenin.

FERNAND. A tantôt, alors.

II. (*a*) Write a synopsis, in the first person singular, including infinitive, participles, and imperative singular, of the five verbs (see I, *a*): *vécu, tenaient, comprenant, amené, vu.*

(*b*) What are the general principles governing the use of the indicative, conditional, and subjunctive moods?

III. Translate into French:

Tell me, what has kept you from selling that old house, the shutters of which always remain closed? It is quite alone; at night one hears strange noises in it;

Digitized by Google

and little boys who have to pass near it run away without looking at it. I am sorry you did not sell it to M. André when you sold him your farm and your brother's. You will do well to accept what M. André has offered you for it; and I wish you to go and see him this very evening.

C.—ADVANCED FRENCH.

I. Translate into English:

(*a*) Tous ces dons sont communs aux orateurs; on les retrouve avec des proportions et des degrés différents chez des hommes comme Cicéron et Tite-Live, comme Bourdaloue et Bossuet, comme Fox et Burke. Ces beaux et solides esprits forment une famille naturelle, et les uns comme les autres ont pour trait principal l'habitude et le talent de passer des idées particulières aux idées générales, avec ordre et avec suite, comme on monte un escalier en posant le pied tour à tour sur chaque degré. L'inconvénient de cet art, c'est l'emploi du lieu commun. Les hommes qui le pratiquent ne peignent pas les objets avec précision, ils tombent aisément dans la rhétorique vague. Ils ont en main des développements tout faits, sorte d'échelles portatives qui s'appliquent également bien sur les deux faces contraires de la même question et de toute question.—TAINE.

(*b*) Les règles générales ne sont que des expédients mesquins pour suppléer à l'absence du grand sens moral, qui suffit à lui seul pour révéler en toute occasion à l'homme ce qui est le plus beau. C'est vouloir suppléer par des instructions préparées d'avance à la spontanéité intime. La variété des cas déjoue sans cesse toutes les prévisions. Rien, rien ne remplace l'âme: aucun renseignement ne saurait suppléer chez l'homme à l'inspiration de sa nature.—RENAN.

(*c*) Phèdre, si ton chasseur avait autant de charmes
Qu'en donne à son visage un si docte pinceau,
Ta passion fut juste et mérite des larmes
Pour plaindre le malheur qui le met au tombeau.

Et si tu parus lors avec autant de grâce
Qu'en ces vers éclatants qui te rendent le jour,
Estime qui voudra son courage de glace,
Sa froideur fut un crime, et non pas ton amour.

Aussi, quoi qu'on ait dit du courroux de Thésée,
Sa mort n'est pas l'effet de son ressentiment,
Mais les Dieux l'ont puni pour t'avoir méprisée,
Et fait de son trépas un juste châtiment.

—CORNEILLE.

(*d*) Du Dieu qui nous créa la clémence infinie,
Pour adoucir les maux de cette courte vie,
A placé parmi nous deux êtres bienfaisants,
De la terre à jamais aimables habitants,
Soutiens dans les travaux, trésors dans l'indigence,
L'un est le doux sommeil, et l'autre est l'espérance:
L'un, quand l'homme accablé sent de son faible corps
Les organes vaincus sans force et sans ressorts,
Vient par un calme heureux secourir la nature
Et lui porter l'oubli des peines qu'elle endure;
L'autre anime nos cœurs, enflamme nos désirs,
Et même en nous trompant, donne de vrais plaisirs;
Mais aux mortels chéris à qui le ciel l'envoie
Elle n'inspire point une infidèle joie;
Elle apporte de Dieu la promesse et l'appui;
Elle est inébranlable, et pure comme lui.

—VOLTAIRE.

II. (*a*) Explain the two cases of subjunctive that occur in I (*c*).

(*b*) Point out two cases of poetic inversion in I (*d*).

(*c*) Define *aimable* as used in classic poetry and as used in modern prose.

III. Write fifteen or twenty lines of French about the author of one of the preceding selections, or about one of the persons mentioned in I (*a*).

IV. Translate into French:

The following day, at three o'clock in the afternoon, they came to Surgères. The cardinal was waiting there for Louis XIII. The minister and the King exchanged many affectionate greetings, and congratulated each other on the lucky chance that had rid France of the relentless enemy who was stirring up Europe against her. Thereupon the cardinal, having been informed by Rochefort that D'Artagnan had been arrested, and being eager to see him, took leave of the King, and returned to the house he occupied, near the bridge of La Pierre. There he found D'Artagnan standing without a sword before the door, and the three guardsmen armed.

D.—ELEMENTARY GERMAN.

I. Translate into English:

(*a*) Ich folgte sogleich dem Boten, und er führte mich in ein kleines Zimmer, das seiner schlechten Einrichtung[1] nach zu den billigsten des Gasthauses gehören muszte. Auf einem Bette lag eine schöne, junge Frau mit geschlossenen Augen und totenbleichen,[2] aber edlen und feinen Zügen. Ein Dienstmädchen war mitleidig um sie bemüht,[3] und neben ihr im Bette sasz ein etwa dreijähriges, blondlockiges Bübchen, jämmerlich[4] weinend und seine Mutter mit den süszesten Namen rufend und flehentlich[5] bittend, sie möchte doch die Augen aufmachen und ihn wieder lieb haben. Ich hob den kleinen Burschen vom Bett herunter und setzte ihn auf den Boden nieder. Er blieb auch ruhig sitzen, seine groszen, blauen Augen unverwandt[6] auf die Mutter gerichtet. Meine Bemühungen, diese wieder zum Bewusztsein[7] zu bringen, wurden bald mit Erfolg belohnt. Die Frau atmete schwer und schlug die Augen auf, aber sie war zu schwach um auf meine Fragen vernehmlich[8] antworten zu können.—*Adapted from* HELENE STÖKL.

[1] Einrichtung, *equipment, furnishings.* [2] Bleich, *pale.* [3] Bemüht, *occupied.* [4] Jämmerlich, *piteously.* [5] Flehentlich, *imploringly.* [6] Unverwandt, *incessantly.* [7] Bewusztsein, *consciousness.* [8] Vernehmlich, *audibly.*

(*b*) *Waldgegend. Vorn rechts ein altertümliches*[1] *Gebäude; vor demselben ein Tisch mit Stühlen und einer Bank, unter einem Baume; links ein Thor; im Hintergrunde eine Mauer. Vor derselben eine Anhöhe.*[2]

HEDWIG, *singt.* Wenn ich ein Vöglein wär'
Und auch zwei Flüglein hätt',

URSULA, *kommt mit Frühstück, das sie auf den Tisch stellt.* Du bist ja schon früh bei der Hand, mein Kind.

HEDWIG. Sagst du nicht immer: Morgenstund' hat Gold im Mund?

URSULA. Das ist schon recht, dasz du mit der Lerche auffliegst, aber die Vögel, die zu früh singen, holt am Abend die Katze.

HEDWIG. Soll ich eine Lerche sein, dann musz ich auch mein Lied für mich haben.

URSULA. Das Lied paszt nur nicht an diesen Ort.

HEDWIG. Aber es paszt zu meinem Herzen. Ja, alte Ursula, ich wünschte, dasz ich ein Vöglein wär', und auch zwei Flügel hätt'.

URSULA. Und wo sollte es dann hinaus?

HEDWIG. Weit, weit weg! Über die Mauer, über die Bäume, über den Wald, über das Feld—in die ferne, schöne Gotteswelt!—KÖNIGSWINTER.

[1] Altertümlich, *ancient-looking.* [2] Anhöhe, *elevation.*

II. (*a*) Give the nominative and genitive singular (with the definite article) and the nominative plural of *Boten, Füsze, Zimmer, Einrichtung, Hauses, Bette, Frau, Auge, Zügen, Mutter, Fragen, Gestalt.*

(*b*) Decline throughout the German phrases meaning *the new house, my dear friend.*

(*c*) Give the principal parts of *muszte, lag, geschlossen, rufend, bittend, möchte, aufmachen, hob herunter, blieb, sitzen, bringen, schlug auf, können.*

(*d*) Give the third person singular, of each tense in the indicative mode, of *bittend, blieb, schlug auf.*

(*e*) What case is governed by each of the prepositions: *Auf, aus, bei, durch, für, in, mit, über, um, von, wegen, zu.*

III. Translate into German:

(*a*) Who is that old gentleman with the white beard?[1] Surely I have seen him somewhere.[2]

(*b*) So this is your new house. What a lovely view[3] from this window! But I do not see the old castle[4] of which you told me in your letter.

(*c*) He has lived two whole years in Germany, and has just returned. He speaks German pretty well, but does not seem to have read much.

(*d*) I will do the best I can, but you must not expect too much. Perhaps it would be better if you should go to him yourself.

(*e*) Come now, Hedwig, and eat your breakfast. You are not a bird and can not fly. And, after all,[5] is it not better to be a pretty girl than a stupid[6] bird?

[1] Beard, *der Bart.* [2] Somewhere, *irgendwo.* [3] View, *die Aussicht.* [4] Castle, *das Schloss.* [5] After all, *am Ende.* [6] Stupid, *dumm.*

E.—INTERMEDIATE GERMAN.

I. Translate into English:

(*a*) Die Wohnungen in den Bädern von L. sind entweder unten in einem Dorf, das von hohen Bergen umschlossen ist, oder sie liegen auf einem dieser Berge selbst, unfern der Hauptquelle, wo eine pittoreske Häusergruppe in das reizende Thal hinabschaut. Einige aber liegen auch einzeln zerstreut an den Bergesabhängen, und man musz mühsam hinaufkommen durch Weinreben, Myrtengesträuch, Lorbeerbüsche und andere vornehme Blumen und Pflanzen, ein wildes Paradies. Ich habe nie ein reizenderes Thal gesehen, besonders wenn man von der Terasse des oberen Bades, wo die ernstgrünen Cypressen stehen, ins Dorf hinabschaut. Man sieht dort die Brücke, die über ein Flüsschen führt, welches L. heiszt, und, das Dorf in zwei Teile durchschneidend, ein Geräusch hervorbringt, als wolle es die angenehmsten Dinge sagen, und könne vor dem allseitig plaudernden Echo nicht zu Worte kommen.—HEINE.

(*b*) Bernhard schritt durch enge Gassen nach dem Markte, er fand die Straszen voll von geschäftigen Menschen, die den Fremdling neugierig und forschend ansahen, viele unter ihnen in mangelhafter Bekleidung, mit bleichen und vergrämten Gesichtern. Auch die Häuser waren mit Einliegern[1] überfüllt, noch in den Dachfenstern guckten Kinderköpfe und hing die Wäsche armer Leute. Aus den engen Höfen hörte er Gebrüll der Rinder und neben den Hunden liefen grunzende Schweine vor den Hausthüren. Denn viele Landleute waren nach der Stadt geflüchtet und hausten mit ihrem Vieh gedrängt in jämmerlichen Wohnungen. Auch der Marktplatz war mit Bretterbuden und Leinwandzelten[2] besetzt, an welchen armselige Frauen wuschen und kochten und halbnackte Kinder auf den Steinen spielten.—FREYTAG.

[1] Einlieger, *lodger.* [2] Leinwandzelt, *canvas tent.*

(*c*)[1] GESSLER.

Nun, Tell! weil, du den Apfel triffst vom Baume

Auf hundert Schritt, so wirst du deine Kunst
Vor mir bewähren müssen. Nimm die Armbrust—
Du hast sie gleich zur Hand—und mach dich fertig,
Einen Apfel von des Knaben Kopf zu schieszen—
Doch, will ich raten, ziele gut, dasz du
Den Apfel treffest auf den ersten Schusz!
Denn fehlst du ihn, so ist dein Kopf verloren.
[*Alle geben Zeichen des Schreckens.*]

TELL.

Herr, welches Ungeheure sinnet Ihr
Mir an?—Ich soll vom Haupte meines Kindes—
Nein, nein doch, lieber Herr, das kommt Euch nicht
Zu Sinn.—Verhüt's der gnäd'ge Gott.—Das könnt Ihr
Im Ernst von einem Vater nicht begehren!

[1] The candidate is here supposed to have read Schiller's Tell. If he has not, passage (c) should be replaced by another, taken from a classic previously studied.

II. (*a*) Compare the adjectives *alt*, *kurz*, *bedeutend*, *wild*, *dunkel*, *hoch*, *ober*, *erst*, *deutsch*, *ganz*.

(*b*) Explain the use of *sein* and *haben* as auxiliaries of tense, and put into German: (1) The boy has fallen into the water; (2) he has traveled much, but seen little; (3) I have remained too long; (4) I have been sitting in my room all day; (5) you have slept two hours; (6) the child has fallen asleep.[1]

(*c*) How do the modal auxiliaries differ in conjugation from ordinary weak verbs, and how from strong verbs? Put into German: (1) I will tell you something; (2) we can not go; (3) he had to stay at home; (4) I should like to know; (5) she will not be permitted to come; (6) I have not been able to see him.

(*d*) In passage (*c*) explain (1) the plural Schritt; (2) the subjunctive treffest; (3) the use of the article in des Schreckens.

[1] Fall asleep, *einschlafen*.

III. Translate into German:

There was once an old goat[1] that had seven kids.[2] One day she had to go out into the woods to get food[3] for her young ones. So she called them all to her, and said: "I must go away now, and shall not come back till evening. You must all stay in the house and not let anyone in till I come home. If the wolf comes, you will know him by[4] his[5] rough voice and his black feet." Soon the wolf came and said: "Open the door and let me in. I am your mother and have brought you some cakes." But the kids knew by the rough voice that it was not their mother, and the oldest kid looked out of the window and saw the wolf standing there and told him to go away.

[1] Goat, *die Ziege*. [2] Kid, *Geislein*. [3] Food, *das Futter*. [4] By, *an*. [5] Rough, *rauh*.

F.—ADVANCED GERMAN.

I. Translate into English:

(*a*) Die Kunst ist lang, das Leben kurz, das Urteil schwierig, die Gelegenheit flüchtig. Handeln ist leicht, Denken schwer, nach dem Gedachten handeln unbequem. Die Nachahmung ist uns angeboren, das Nachzuahmende wird nicht leicht erkannt. Selten wird das Treffliche gefunden, seltener geschäzt. Die Höhe reizt uns, nicht die Stufen; den Gipfel im Auge wandeln wir gerne auf der Ebene. Nur ein Teil der Kunst kann gelehrt werden, der Künstler braucht

Digitized by Google

sie ganz. Wer sie halb kennt, ist immer irre und redet viel; wer sie ganz besitzt, mag nur thun und redet selten oder spät. Jene haben keine Geheimnisse und keine Kraft; ihre Lehre ist wie gebackenes Brod, schmackhaft und sättigend für *einen* Tag: aber Mehl kann man nicht säen, und die Saatfrüchte sollen nicht vermahlen werden. Die Worte sind gut, sie sind aber nicht das Beste. Das Beste wird nicht deutlich durch Worte. Der Geist, aus dem wir handeln, ist das Höchste. Niemand weisz, was er thut, wenn er recht handelt; aber des Unrechten sind wir uns immer bewuszt. Des echten Künstlers Lehre schlieszt den Sinn auf; denn wo die Worte fehlen, spricht die That. Der echte Schüler lernt aus dem Bekannten das Unbekannte entwickeln und nähert sich dem Meister.—GOETHE.

(*b*) Alle Morgen wird auf unseren Frühstückstisch mit der Zeitung ein Bündel der verschiedenartigsten Neuigkeiten gelegt: Weltlauf und Privatschicksale, Handel und Verkehr, Feuilleton und Theaterskandal, Börse und pikanter Roman. Unter dieser Fülle von Dingen, wie Vieles davon ist brauchbar für unser Leben und unsere Bildung? Wie Vieles nährt das heilige Feuer der Humanität? Und wie Vieles schmeichelt unseren schlimmeren Neigungen und Trieben? Man sage nicht, dasz hier nur das Angebot der Nachfrage entspreche; die Nachfrage hätte zurückgedrängt werden können, wäre das Angebot nicht so eifrig gewesen. Und wenn es dabei bliebe! Aber dabei hat es sein Bewenden nicht, der Leser erhält durch die Zeitung nicht blosz den Stoff, sondern den Stoff in einer bestimmten Form und Fassung, begleitet von einem entschiedehen, wenngleich anonymen Urteil. . . . Und mag sich ein eifriger Zeitungsleser noch so sehr und so lange sträuben, die Meinung des Blattes, das er hält, als die seinige aufzunehmen, es kommen erst Augenblicke, dann Tage und Wochen, in denen es ihm bequem ist, wenn das Journal für ihn denkt, und ist er so weit, dann wird ihm das Denken überhaupt zu mühsam und er überläszt es ein für allemal seinem gedruckten Orakel.—SCHÖNBACH.

II. (*a*) Without translating, paraphrase the following passage in ordinary German prose:

Es ist der Krieg ein roh, gewaltsam Handwerk.
Man kommt nicht aus mit sanften Mitteln, alles
Läszt sich nicht schonen. Wollte man's erpassen,
Bis sie zu Wien aus vier und zwanzig Übeln
Das kleinste ausgewählt, man paszte lange!
—Frisch mitten durchgegriffen, das ist besser!
Reisz dann, was mag!—Die Menschen, in der Regel,
Verstehen sich aufs Flicken und aufs Stückeln,
Und finden sich in ein verhasztes Müssen
Weit besser als in eine bittre Wahl.—SCHILLER.

(*b*) Explain in German (1) the use of the uninflected forms, *roh gewaltsam;* (2) the difference between *passen* and *erpassen;* (3) the use of *durchgegriffen.*

(*c*) Give the first five lines as they would appear in a report introduced by *er sagte.*

(*d*) Explain in German the meaning of the last two lines.

III. Write fifteen or twenty lines in German upon the plot of some play or novel that you have read.

IV. Translate into German:

One of the most beautiful traits in the character of Frederick the Great was his strict love of justice. Who does not know the story of the windmill at Potsdam, which the King wished to buy of the owner because it stood in his way in the laying out[1] of the park of Sans-Souci? The miller refused steadfastly to sell his property, though the King offered him a large sum and promised to have another mill built for him. But the obstinate old fellow only answered, "My grandfather built this mill, I inherited it from my father, and my children shall inherit it from

Digitized by Google

me." The King now became impatient and said, "But you know, I suppose, that I might have your mill for nothing if I wished?" "Yes," answered the miller, "if there were no chamber of justice[2] at Berlin." Pleased at the confidence which the old miller had in the Prussian courts, the King dismissed the man without further words.

[1] Laying out, *die Anlage.* [2] Chamber of justice, *das Kammergericht.*

CHAPTER XXVII.

UNIVERSITY TYPES AND IDEALS.

CONTENTS.—Address of Dr. E. Levasseur in response to the toast, "American Universities."—Address of Dr. H. Moissan: "The University of Chicago."—Address of Dr. Michael Foster at the Johns Hopkins University.—Notes on the University of Turin, by M. E. Haguenin.

In all countries there is noticeable at this time great activity in respect to higher education, and particularly in respect to means for promoting international relations and exchange of ideas and of instructions. This country contributes a large and ever increasing quota of students to European universities, and efforts are made to bring foreign professors of note to lecture in our universities. These movements naturally increase the desire of Americans to understand the administration and the daily routine of foreign universities, and also to know the opinions that foreign critics entertain of institutions on this side of the Atlantic.

In response to this interest there are reproduced in this chapter the addresses of three distinguished foreigners who have lately visited certain leading universities of this country. These addresses derive particular value from the fact that incidental comparisons are maintained in each case with the university which the speaker represents. In this way the foreign standpoint is made clear. The difference between the American system of degree examinations and that of France is noticed particularly by M. Levasseur. This is a difference of prime importance to the American student who seeks a degree under the favorable conditions now offered by the French universities. The address of Dr. Michael Foster makes clear the recent modifications that have been made in examinations at Cambridge, England. The notes on an Italian university (Turin), cited from an article by a French writer, M. Haguenin, emphasize again by contrast the peculiar features of the French system. It is interesting to observe that in the Italian university, whose organization bears outward resemblance to that of the French university, there is encountered substantially the same system as regards examination that prevails in the universities of this country. We note, also, that the French observer is affected by the presence of women in Italian universities in the same way as his countrymen are affected by their general admission to American universities. In France, so far as the law goes, women are freely admitted to the universities, but custom has so limited the privilege that it still has, for French women at least, the appearance of a novel innovation. They are seldom found mingling with the men students excepting in the public lectures. This does not interfere with their aspirations for degrees, since students from private courses are admitted to the state degree examinations by paying the necessary fees and giving proof of the requisite preparation.

RESPONSE TO THE TOAST "THE AMERICAN UNIVERSITIES," AT THE AMERICAN UNIVERSITY CLUB DINNER (PARIS).

[By Dr. E. LEVASSEUR.]

I have been in America twice. The first time I visited the country, in 1876, I was engaged especially in studying the schools without, however, neglecting to observe the economical condition of the great Republic. On the second occasion, in 1893, my attention was devoted to the working classes and the industrial condition of the country in fulfillment of the mission with which I had been charged by the Academy of Moral and Political Sciences, and to prepare myself for the publication of L'Ouvrier Américain, but I nevertheless did not neglect my studies of education. I was struck with the progress which seventeen years had made in every place I revisited, both from an economical point of view, in the increased size of the cities, and the growth of manufactures, and also in the increased number of schools, and the scope of their artistic, literary, and scientific studies. I would have been more surprised, perhaps, if I had not been previously notified of the changes I was to witness in letters from American friends. It was sufficient for me to contemplate the colonnades and domes of the "White City" at the World's Fair—an imposing ensemble, remarkable in many ways, and too little appreciated then by European critics (and, I may add, by the New York critics, too), and then to recall the "halls" of the centennial exhibition, and this comparison gave me a kind of measure of the progress in taste and the feeling for art that the United States had made from 1876 to 1893.

But, gentlemen, the president has not called upon me to speak either of industry or art, nor to speak to you of education in general. I discussed the system of American common schools in my work on primary instruction in civilized countries, and I deemed that system interesting and original enough to devote the longest chapter in the volume to it. I will, therefore, say nothing upon this subject, for I think it is only superior education that I am called upon to speak to you about.

In this branch, too, remarkable progress has been made in our generation which merits our attention, I may say our admiration, in certain respects. If young America comes to Europe to attend our lectures, it furnishes Europe with examples that we might well occasionally copy.

The Parisian students who attend the magnificent palace of the new Sorbonne can not imagine by comparison what an American university is, but the young Englishmen who promenade in the quadrangles and under the shade of the ancient trees of Oxford could form a better idea of it. American universities usually occupy vast spaces, except in a few large cities like New York, where Columbia College has recently quitted the too valuable ground on Forty-ninth street to build splendid edifices farther away, near the Hudson. Even in those cities which have grown up around the universities, as at Harvard or Yale, the university buildings, for the most part of Gothic or Roman architecture, are situated in a park which is often of great extent. I traveled through the park of the University of Wisconsin in a carriage; and I well remember the surprise I felt, twenty-two years ago, when I saw a river in the campus of Cornell University, with an imposing cascade and a series of hillsides from which the city and lake lying below could be seen. While I speak I am again in imagination in the president's house, surrounded with a grove of fine trees, and I remember with pleasure that I there formed a friendship with the president, Mr. Andrew White, now ambassador of the United States at Berlin, which I still cherish. One of the reasons why these university parks are so large is that land (even in the western part of New York), does not cost much, and that most of the universities received a territorial endowment at their birth.

Digitized by Google

The liberality of private individuals to the institutions of superior education is one of the characteristics of the American nation. In 1895–96—the last year of which I have accounts—the sum of these liberalities amounted to more than 41,500,000 francs ($8,343,000). Although this was not an especially favorable year for this species of charity, 14 universities received more than $100,000 each, Yale taking for her part $445,000. Gifts of over $1,000,000 are mentioned. I know of 18 of such in twenty years, of which the largest, made in successive payments, is that of Mr. Rockefeller to the University of Chicago, which amounted to $7,426,000. This university, scarcely eight years old, has already covered a great part of its extensive campus with large and handsome buildings. It has 330,000 volumes in its library, and in 1897 received 2,000 students. Only a short time ago a new dormitory, Blair Hall, was completed on the campus at Princeton at a cost of $150,000, the gift of the New Jersey philanthropist, Mr. John I. Blair.

Most of the States have effected useful legislation in the matter of education, which I commend to the attention of our own statesmen. They have declared that the gifts and legacies made to educational institutions should not be diverted to other purposes than those originally specified, and the same is true in regard to other institutions of public utility.

It is from the gifts above mentioned that the enormous wealth of these various universities is derived. Their total invested funds were estimated at $109,562,000 in 1896, and the value of their lands and buildings at $118,106,000, without counting the value of their scientific equipment or libraries, which would be probably over $20,000,000 more.

The United States Government and many municipalities have endowed a certain number of universities, especially in the West. But these endowments, which were made sometimes in money and more often in lands, only constitute the smallest part of the university fortune. The Federal Government contributed to this endowment principally for the foundation of colleges of agriculture and the mechanic arts or the annexation of a department of this kind to an already existing university. The land-grant act of 1862, introduced by Senator Morrill, is the first and most important of the legislative measures taken for this object.

The income of the 484 universities and colleges, coming partly from the students' fees and partly from the interest of the investments, was nearly $20,000,000 in 1895–96. Despite the sumptuous presents made to some of the younger universities of the middle West and the Pacific coast, it is still the Northeast that holds the first rank in this respect. Although the universities of that portion of the country are only 16 per cent of the total number, they possess more than half (55 per cent) of the wealth of superior instruction. If the University of Chicago has to-day an invested fund of $5,000,000, Cornell has $6,300,000; Harvard, $8,900,000; Columbia, $9,400,000; and Girard College, the name of which recalls a French philanthropist, and where instruction is of a special character, $15,000,000. It is true that besides the rich universities there are others which are very poor. Out of the 484 which send returns to the Commissioner of Education, 158 had no endowment, and 54 had less than $25,000.

I hope, gentlemen, you will have the indulgence to pardon a statistician for citing these figures to you. It is a somewhat indigestible food for dessert and is probably a superfluous aliment for the Americans here present, who know these figures better than I. But it is well that Frenchmen should know what progress has been made on the other side of the Atlantic. Now, statistics, although they may not give all the truth, or be absolute truth itself, do furnish, when they are prepared with sincerity and employed with discernment, a more precise measure of progress than pompous phrases of laudation.

The oldest American university, Harvard, was founded in 1636. In the South, William and Mary's College (at Williamsburg, Va.), which dates from the end of the seventeenth century, formerly enjoyed a reputation equal to that of Harvard.

Digitized by Google

Jefferson was one of its directors. President Eliot, of Harvard, and General Walker wrote three years ago that the University of Virginia was the first to introduce upon the American continent the real methods of superior education. About twenty other colleges were founded before the nineteenth century. In the second half of this century new institutions have multiplied, more than 65 having been opened in each decade. In 1895–96, as I have said, 484 universities and colleges sent their returns to Washington. The number of students has augmented still more rapidly. In 1872, when the statistics of education were first collected, the number of students in the colleges (who are far from being all the university students) was 23,392. In 1895 the number was 81,952, an increase, the proportion of which was twice as great as that of the population. More than a fifth of the colleges and universities are unsectarian, and consequently open to students of any religious denomination. Fifty-eight are Catholic, 57 Methodist Episcopal, and 50 Baptist. The Presbyterians and Methodist Episcopalians of the South, the Congregationalists, the Lutherans, and the Christians have from 39 to 20 for each denomination.

There are many small universities and some large ones. In 1897, 34 had over 1,000 students.

Women have for a long time had the doors of superior education opened to them. There are about 17,000 of them in 183 establishments which are attended by young men as well, and they possess 162 establishments of their own, which had 24,663 students in 1896.[1]

In 1896 Dr. Harris found a total of 159,372 students in the colleges and universities, but from this total 47,000 should be deducted, that figure representing students of preparatory courses who receive secondary instruction. The 68,629 college students themselves receive instruction on a par with that of a part of our lycées. A German professor lately questioned whether he could legally give the name of university to American institutions, because he found great differences between their programmes and that of the University of Berlin. We may answer him that there is no single type of university, but each country has, and ought to have, its own originality in this respect. The new French universities do not resemble the German, even after all the changes and improvements in our faculties in the last twenty years, and the American universities, more or less derived from the English type, are unlike both.

The college is the essential foundation of American university education. The age of admission to them is between 13 and 19 years usually, but the age of the majority of freshmen is nearer 19 than 13. Many universities have opened preparatory courses by means of which they draw to themselves part of the clientèle of the secondary schools, public or private, the high schools, academies, latin schools, etc. But it is in college only that the university courses begin, to which applicants are admitted without examination, or after one which is more or less severe, according to the importance and renown of the university. These courses last four years, and bear in succession the names of freshman, sophomore, junior, and senior years. During the first two years the studies do not ordinarily pass above the secondary grade. Dr. Harris has computed, by leaving out the freshmen and sophomores, and a portion of the special students, that 62,974 young men were following superior studies comparable to those of the students of European universities. Perhaps he would have deducted more if he had taken for comparison the lycées of Paris which have a higher degree of rhetoric. Practically there is one student for 1,111 inhabitants in the United States, while in France there is one to 1,344. The proportion would, probably, not be sensibly different in the two countries if the students of the special superior schools in France were added

[1] A table of all the universities and colleges, with the number of graduates, students, books in the libraries, and the names of the presidents for 1897, is given by M. Levasseur in a foot note to this paragraph, taken from the Report of the Commissioner of Education, as are, naturally, most of the statistics cited in this article. Whenever such statistics are given in tabular form they are omitted here, as they have been already published. (AM. ED.)

to those attending the faculties, such schools being more numerous in France than in the United States.

America, which has a highly organized system of primary schools, although this system is susceptible of improvement, particularly in regard to the selection of the teachers, is much less advanced in the organization of her secondary instruction, in spite of the increased number of high schools. Both pedagogues and committees are studying this question of reorganization of secondary instruction, which is the feeblest side of the American educational system to-day. The intellectual condition of the majority of the young men who enter college indicates the insufficiency of their preparation. In the large universities, like Columbia, Yale, and Harvard, conditions of admission are required, but in many universities the examination may be cut into two parts and may be held in many places,[1] and besides, each professor examines candidates separately. In others, indulgence is pushed very far, so as to attract students. In the large universities young men without diplomas are authorized to follow certain courses as special students.

The system that has prevailed for the last fifteen years is a liberal one. It is that which allows the student an option in his studies by virtue of which he makes his choice of the subjects taught, but with a fixed minimum of courses, and he is obliged to attend regularly those he has chosen. The authorized American pedagogues do not wish to impose a superficial omniscience upon their students, but they require that they should know well a certain number of obligatory or elective studies.

I take two examples of school organization, one from a college of moderate importance and the other from the first university of the United States.

Swarthmore College was founded in 1864 by the Society of Friends. The buildings, situated upon a hill, have a monumental appearance, with a gently-sloping lawn in front and a park with fine trees on the sides. The principal building contains the dormitories, the lecture rooms, and physical and other laboratories. In the park are several other buildings, including a gymnasium and an observatory. The site is entirely rural. The village containing the houses of the professors is at several hundred yards distance. The system is that of coeducation, and the students live on the premises. The price of board [and tuition] is $450, which does not include books and apparatus. Religious exercises are compulsorily attended by both male and female students. Smoking is prohibited. The entrance examination includes mathematics, grammar, English composition, and—according to the branch the student intends to follow—Greek, Latin, French, or German for the classical course; and for the literary course Latin, French, and German, and the same for the engineering and scientific courses, with some variations. The years are divided into freshman, sophomore, junior, and senior, as is customary. In the arts department besides classical antiquity the studies consist of ancient languages, literature, history, modern languages, the sciences, and applied political economy. The degree is bachelor of arts. The literary department covers nearly the same matters excepting the dead languages, Latin being elective. The degree is bachelor of letters. The scientific department gives some space to the modern languages and a much larger to mathematics, physical and natural sciences and laboratory work. The degree is bachelor of science. The course in civil engineering leads to the degree of bachelor of science (engineering). The course is both liberal and technical. The courses last two scholastic semesters, and some are elective. After the degree of bachelor the students may prepare themselves for the degree of master and civil engineer.

[1] The writer does not seem to understand exactly the significance of the division of "entrance examinations" into two parts. This is done only by the highest institutions, those whose requirements are most severe. An interval is sometimes allowed between the two examinations as a means of reducing the strain on the candidate, and also of allowing him longer time to prepare in the more difficult subjects. (AM. ED).

Harvard University is the most complete type of the American university. The faculty of arts and sciences, comprising the college, the scientific school, and the graduate school constitute the principal body of instructors. During the four years of college the studies consist of the dead and living languages, history and social science, the exact and natural sciences, and the student advances by degrees (elementary and advanced studies) and by a series of examinations held in February and June to a final examination by which he obtains the diploma of A. B., or bachelor of arts. Some of the students stop on the way, but the great majority strive to reach the end, even if it is necessary to make several attempts.

From what I learned in America I place the diploma of the three or four principal universities, judging, if not by the subjects, at least by the degree of intellectual development acquired by the students, somewhere between our baccalauréat ès-lettres and our licence. The comparison, however, between the American and French systems has no common ground, because of the difference of the programmes and in the methods of granting degrees. In the United States the examination for bachelor, like the entrance examination, is conducted by each teacher separately for the subjects he teaches, without publicity and without control. Now there have been instances in certain universities where the professors have shown favoritism toward students to whom they have given private lessons, or whose patronage they desired. It has happened, too, that professors owe their positions to political influence more than to attainments.[1]

The Lawrence Scientific School at Harvard and the Sheffield Scientific School at Yale, while being part of the university faculty, yet have their own deans and administration, and they give less latitude to their students. They give the degree of bachelor of science (B. S.) after a course of four years, in which, naturally, science and modern languages predominate.

At the end of the four years' course the seniors celebrate, with comic ceremonies, their "class day," which marks their exit from the university. This is a traditional occasion in nearly all the universities, which precedes the official solemnities of commencement, when the degrees are conferred. The college and scientific school are called the undergraduate departments. The graduate department, which has its own administration, is open to the students who have the degree of bachelor, although special students are admitted without diplomas. They can not, however, obtain degrees, as a rule. The students of the graduate department should be classed in the grade of real superior education. They draw up themselves, with the approval of the corps of professors, the programme of studies they wish to pursue. After a year they can take the degree of master of arts (M. A.), and after two years that of doctor of philosophy (Ph. D.) or of science (S. D.), if they have presented theses of sufficient originality and have successfully undergone the oral examination. The doctorate is the highest degree granted for liberal studies and is the badge of the well-educated man, in the world and public life as well as in the professions.

The other university departments have a professional character. The Harvard Divinity School is "unsectarian;" that is, it is not attached to any one of the Protestant churches. Admission is granted to bachelors of arts or to those who give proof of having received an equivalent education. The course is three years and leads to the degree of bachelor of divinity (D. B.).

The law school, to which admission is gained by the bachelor's diploma or by examination, leads, after three years, to the degree of bachelor of laws (LL. B.). The medical school, situated in Boston, to be near the hospitals, gives a four years' course of theoretical studies and practical exercises. Entrance is gained

[1] These cases are extremely rare; indeed, judging from the criticism of many Frenchmen of their own system, not more common than under the centralized control of the French universities. (AM. ED.)

Digitized by Google

by diploma, either from a college or scientific school, or special examination, and the degree is doctor of medicine (M. D.).

The dental school, which is also situated in Boston, admission to which is obtained on the same conditions as the medical school, has a three years' course and gives the degree of doctor of dental medicine.

To complete the view of this varied education we must still add the school of veterinary medicine and the school of agriculture and horticulture called the "Bussey Institute," the summer courses, created principally for the benefit of the professors during vacations, and the woman's annex, all of which receive separately, but by the same teachers, the college instruction. An astronomical observatory, richly endowed, is attached to Harvard.

In nearly all the establishments the students in the colleges are the most numerous. Dr. Harris calculates for the year 1895 that 31 per cent of the student population was in the preparatory schools, 42 per cent in the colleges, 3 per cent in the graduate departments, 16 per cent in the professional schools, and 8 per cent in other branches. Thus the degrees of bachelor of arts were the most numerous. Out of 9,972 degrees granted in 1894–95, 4,891 were bachelors of arts, including bachelors of philosophy.

There are, however, universities where this proportion does not hold. I will cite one which is, assuredly, one of the most remarkable types of higher instruction to be found in America; I mean the Johns Hopkins University, which was founded in 1876, at Baltimore, and has been ever since its origin under the direction of Mr. Daniel C. Gilman, and which has been almost entirely devoted to "post-graduate studies;" that is, to a higher grade of studies that young men wish to pursue who have already received at least the degree of bachelor of arts. At Johns Hopkins the examinations are made by a special jury which is paid for performing that duty. During the first seventeen years of its existence this institution had only literary and scientific departments, which, moreover, were not divided into the usual four years' course and whose special object was to develop original research. The medical school has been in existence only five years, but the reputation of the institution is already well established after even the few years of its activity, and already many university professors have graduated from the Johns Hopkins University. I can speak personally only of the department of social science, which is in charge of Mr. Herbert B. Adams, and which might be held up as a model.

Some universities have a special department of fine arts; many have an engineering department, a speciality for which the industries and railroads of the United States offer large opportunities. Harvard has no school of this kind because there is a well organized institution of the kind in Boston, the Massachusetts Institute of Technology, of which the lamented Gen. Francis A. Walker, whose friendship I had the honor to have, was director, and whose flourishing condition was largely due to his energy. This school had an attendance of 1,300 in 1896, when there were 48 special technological schools in the United States with a total of 12,816 students. These schools were mostly State institutions.

The large universities publish reviews and journals, which are sometimes conducted wholly by the students, or are reviews to which the professors contribute. Some of them enjoy a merited reputation, and I may mention those with which I am familiar, The Quarterly Review of Economics, at Harvard: The Yale Review; Johns Hopkins University Studies in Historical and Political Science; and The Journal of Economics, of the University of Chicago.

University life seems to be on the average more expensive in America than in France, but the American student, like the American workman, has a kind of elasticity of needs and desires, which enables him to content himself with a little when his resources are limited. In many universities one must have $100 or $200

Digitized by Google

for living expenses, besides the university expenses proper, which may be put at $50, besides different accessory expenses. The total will amount to $225 on an average. The secretary of Harvard said in 1893 that a student could get along, with strict economy, on $400 a year, but that one-fourth of the students spent $600, another fourth $600 to $800. "Every dollar," he added, "over $1,200 is a dangerous dollar." Poor students can get assistance from various fellowships which are open to competition, or are given for other reasons, which have been established in many universities, or by giving lessons as "tutors" to fellow students more fortunate financially than themselves, or by devoting themselves to some lucrative occupation in their leisure hours. It is not unusual to see students earning money during vacation as hotel waiters at the summer resorts with which to pay their way the next year. When I was a guest at the University of Chicago we were waited on at table by students who were paid for their services. Americans have the good nature not to be surprised at such things. Often, indeed, they approve of them as evidences of energy.

Most of the universities have dormitories installed in the university building itself, as at Swarthmore, or more usually in separate buildings, as at Harvard, Yale, and Cornell, and divided into rooms, some being provided with two beds for poor students, and others with one, and more or less luxuriously furnished, according to the fancy of the occupant. These rooms are finished in a superior manner, and in the larger universities they must be engaged in advance. In the universities organized for coeducation the young women ordinarily have a separate dormitory, but not always. The student's room is his home, and he is subjected to very easy discipline. As in England, he enjoys great freedom, and he is looked upon as a man who is responsible for his conduct. There are also "commons," or dining halls, but many students find it more agreeable or economical to live outside of the campus, and generally there are professors or families not connected with the university who take boarders.

The students have clubs and associations, more or less secret in their character, which they nearly all endeavor to enter as soon as they become members of the university. There are football clubs, baseball clubs, croquet and lawn-tennis clubs, boating clubs, and music and athletic clubs. It is in these associations more than in the regular course of studies that the bonds of comradeship are formed. Many of them are quite celebrated in America, and there is a pride in being members of them, so that mature men boast of having belonged to them and recur to them with pleasure.

I am entirely incompetent to judge of the ensemble of the university programmes in the United States, which deal with nearly every branch of human knowledge. I have only wished to indicate the general character of higher education there, which is original and liberal. I will confine myself to adding a few words on the department of historical and social sciences, which I know a little better than the others, and which, usually, combine history, geography, politics, political economy, and sometimes statistics. This class of studies is given to the college students and those of the graduate departments. I may mention particularly in this connection the Johns Hopkins University, the University of Pennsylvania with its Wharton School, Harvard University, Columbia University, the Chicago University, etc. The courses are numerous and varied. They bear, in nearly all the large establishments, upon special or practical subjects rather than upon general or dogmatic expositions. Often one semester is sufficient to treat these subjects, the professor seeming to devote himself especially to guiding the students in the direction of personal studies, whether in simple elementary studies of the manual or in research or composition.

In the majority of colleges political economy is not carried so far. Thus at Swarthmore, in the arts department, it is only studied during one semester in the junior year, during which the professor treats of socialism and money. In the

Digitized by Google

department of letters it is studied during two semesters, but the scientific theory of the subject is made to yield to details, pauperism, crime, charities, intemperance, the Salvation Army—all questions of a social rather than an economical order.

What I saw in 1876 and in 1893, and what I have learned in the interval and since my return, has convinced me that in this department, as probably in others, manifest progress has been made in the last quarter of a century. The published works of the professors testify to this, and the greater impetus of the young men toward a university education confirms this view. Among Americans, as among all other peoples, there are diverse aptitudes, but, generally speaking, young Americans are unwilling to lose either their time or money, and the majority of them obtain results which, if they are not brilliant, are at least proportional to the outlay which they have made with a view to opening a career. My knowledge enables me to augur that in another twenty-five years the great American universities will nearly keep step with the great European universities by importing into the business of letters and the sciences the originality of their own character. Thus they will more and more fill the part that I pointed out in my work on the French population in discussing the European emigration, and I beg your permission to cite the passage I refer to here:

> The groups of Europeans which have formed themselves at different places on the globe are interesting, not only from the commercial point of view, but also from the general standpoint of civilization. They constitute so many new foci of intellectual activity; nature, life, and society are regarded from points of view which are absolutely different from those in which Europeans are placed. Human thought takes on a certain originality, and colonists may repay to civilization by their intellectual works some portion of their debt to it. Without doubt these growing societies are, and will be for a long time to come, especially preoccupied with their material interests. But they are cultivating letters and sciences—especially the latter. North America has already shown that she can contribute largely to their progress.

I was not really qualified to speak on behalf of American universities, but as I have the honor to have the title of doctor from one of them, as I have lectured in two of them, and have been the guest of still another, I have responded with pleasure to the invitation which was extended to me, and I end this summary account by sending to my colleagues in America the good wishes of cordial fellowship of a French university man, I respond to the toast: "To the continuation of the progress of American universities."

THE UNIVERSITY OF CHICAGO.

[By DR. HENRY MOISSAN.]

The council of the University of Paris did me the honor last year to select me as its representative at the sesquicentennial celebration of the University of Princeton. On that occasion I visited the principal centers of instruction of the United States. Having had the pleasure some time before to offer the hospitality of my laboratory to Professor Lengfeld, of Chicago, I looked forward with interest to studying that university in process of formation, and I will now state briefly how that great institution was created.

There was once at Yale University a professor of the Hebrew language named Harper. He had traveled extensively and knew thoroughly the educational institutions of his country, and he had the idea of founding the greatest university in the United States. Unceasingly he followed that idea, devoting himself and his best intelligence to it. It became a fixed idea with him and he reasoned it out completely. He maintained that a university worthy of the name should have certain distinctive qualities. He wished, for example, to separate superior instruction from secondary, which is not often done in the United States. All his professors were to advance science by their original investigations. He laid down

Digitized by Google

the principle that a man can not be a professor of superior instruction unless he has made some successful explorations in the remoter fields of scientific investigation. He believed that young men would have more confidence in those who have personally ventured upon such explorations than in others who are content to describe horizons they have never seen. He maintained that a professor of superior education has not performed his full duty when he has given a certain number of lectures and conducted examinations, and that if he has not contributed to the progress of the science he teaches he is incapable of inspiring the love of it in his students.

Professor Harper had still another idea. He believed that knowledge should be made active, and should be made to emerge from the selfish and impregnable position in which certain minds have wished to retain it. Knowledge, he argued, becomes useful by its applications and the increase of light which it can produce. He wished that his university should not only attract students from everywhere, but should extend itself in every direction. He expected to modify and direct the movement of ideas by lectures, by scientific journals, and by books.

After he had studied the question thoroughly and from every point of view, he determined to pass from theory to practice, and, like a true Yankee, he did not lose a minute, but betook himself to Chicago, where he met a "good fairy," named Rockefeller, to whom he unfolded his ideas and plans. After having all the details explained to him, this man entered into the ideas of the professor of Hebrew, and at the first touch of the ring gave him $600,000 with which to lay the foundation of his university. This benefactor, like all others of the kind in America, was essentially practical, and attached to this first present two conditions—the first was that Professor Harper should be president of the new university, and the second was that the citizens of Chicago should furnish the sum of $400,000 with which to build laboratories.

Good examples are contagious, as everyone knows (and usually tries, accordingly, to avoid them). The spirit of imitation is very well developed in Chicago. In that essentially American community, that is to say, a very practical community and one absorbed in business, the importance and interest of high intellectual culture was at once perceived. Mr. Marshall Field offered a tract of land valued at $125,000 for the building site, and Mr. Kent undertook the construction of the chemical laboratory at his own expense. Others followed, and in less than thirty days the required sum was raised. This happened in May, 1889.

The good fairy Rockefeller was so well pleased that when the ring was rubbed again he placed this time a million at the disposal of Professor Harper, on the trifling condition that the citizens of Chicago should double that sum, or nearly so. All the great capitalists of Chicago, wishing to see the university a success, furnished the sum demanded. This second installment was made in September, 1890, and this little play continued in the same way in February, 1892, December, 1892, and so on, until Mr. Rockefeller had promised, by the end of 1895, the bagatelle of $7,700,000, and the citizens of Chicago $5,000,000.

The professor of Hebrew rubbed his hands, because he saw his dreams becoming realized.

You possibly imagine that he waited until the architects had finished their work before summoning the professors and students. That is not the way they do in Chicago, however. President Harper, who had had much experience in many universities, and was skilled in matters of education, knew that you must strike the iron while it is hot, and he deemed it best not to allow even American enthusiasm to cool. As soon, therefore, as the first contribution of $1,000,000 was secured, he proceeded to summon professors from different parts of the United States. He took a physicist here, a professor of history there, and brought a chemist and a theologian from afar. And if a professor hesitated about going to Chicago, he had an original way of convincing him of the expediency of so doing,

Digitized by Google

viz, by doubling or tripling his salary. The professor was persuaded by such good arguments and came to Chicago, and then he built his laboratory and began his lectures.

As there were no buildings at first, professors and students had to find room as best they could, for the students reached the ground as soon as the professors. Houses were rented; a floor of a hotel was used as a chemical laboratory. I should think that the laboratory odors, which are always more or less evil, would have aroused some objection on the part of the proprietor. But what of that! The university was founded, the students were arriving, the courses of lectures and practical work were being organized, and during this time gifts continued to flow in and the buildings were going up all around a vast campus covered with trees. Everything moved rapidly, and yet with order. President Harper, who combined the functions of director, rector, dean, and professor, was in his office from as early an hour as 4 o'clock in the morning. Instruction in modern languages, Latin, Greek, Hebrew, theology, and literature was organized at once. At its start the university did not include law, medicine, and fine arts in its programme, but will do so eventually. Then came mathematics, physics, and chemistry. Finally, as the laboratories became ready, a beginning was made in anatomy, zoology, botany, geology, and paleontology. An astronomical observatory was established 80 miles from Chicago, which was inaugurated last month. To each chair adjunct professors and assistants were attached. A gymnasium was also built and libraries were established.

Meanwhile, since much attention is paid in the United States to the material welfare of the students, cheerful, healthy, well ventilated and lighted houses were built for them, thanks to new donations which kept coming in.

The university also attached to itself, at their request, a number of institutions of secondary instruction, whose programmes and course of instruction it superintends, which is an excellent way of preparing good students for the future. Add to this outside lectures and evening classes by the professors, the expenses of which are paid by the university, which have a total of 25,000 auditors, and further consider the learned and literary societies, the regular journals and publications of the university, to the number of a dozen or more, and you will see that to superintend all this President Harper well deserves his salary of $10,000.

In 1895 the university expended $660,000. It had about 2,000 students, of whom 500 were in the faculties of letters and sciences.

This university is open the year around. President Harper thinks that four months' vacation is too great a loss of time. In America no one is afraid of overdriving. The school year begins July 1 and is divided into four parts, each of twelve weeks, with one week's vacation between each period. It is a curious fact that the first trimester, that of July, August, and September, is attended by a great number of teachers, male and female, of secondary instruction, who wish to complete their education or gain some degree.

In most American universities there are poor students who perform some kind of manual work outside of their study hours in order to earn money with which to pay their tuition fees, which amount at Chicago to some $35 a trimester. Thus one will take the position of gas-lamp lighter, another will be a hotel waiter, another will pay his way by being steward or cook for his comrades, another will save up from a moderate salary in order to come to the university and get a degree.

When I had the pleasure of visiting Chicago last year, President Harper said to me as we were walking around in the university, "We already have physical, chemical, and botanical laboratories, lecture rooms for the humanities and theology. We shall erect a building over there for zoology and one yonder for physiology. We have much yet to do, but the movement has begun and the University of Chicago will be grand, active, and independent." And he added,

Digitized by Google

"Why do you not modify your doctorate? We would send you our best students with pleasure. But you know that our young men have a practical turn of mind and they will not go to Paris unless they can get the doctor's degree, and they can not pass your baccalaureate and license at once."

I said to myself, "President Harper hardly knows what he is asking. Modify our doctorate indeed! Great Heavens! an enormous undertaking that!" I was as much astonished at this request as I was on another occasion when I was walking through the fine technological collection of Columbia College and the professor who accompanied me said, seeing my admiration of a specimen in one of the cases. "That specimen seems to please you; allow me to present it to you." He opened the cabinet and handed me a fine specimen of silicified wood. I instinctively looked around to see that no watchman had observed us. What was more remarkable was that the specimen had neither mark nor number, and was not catalogued. It is only in America that one sees such things.

To return to Chicago. The grand example of initiative energy shown by President Harper, Mr. Rockefeller, and the generous givers of Chicago is not a rare spectacle in the United States. Most of the universities were founded without State aid, but result from private munificence.

At New York Columbia College needed a library. Its president tendered it $1,000,000. At Princeton the university is theological and literary, and it wished to become scientific. It could find a Mr. Green to give it laboratories. At Princeton, too, Mr. Marquand rebuilt the library at his own expense. Johns Hopkins left $3,500,000 to found the university at Baltimore. Some other benefactor will leave $100.

Examples of this kind are abundant, but perhaps the most curious is that of Mr. and Mrs. Leland Stanford, of California. Mr. Leland Stanford had made a great fortune in business. He had the misfortune to lose his only son some years ago. Together with his wife he planned to employ the greater part of his fortune in the creation of a university for the benefit of happier families, whose children remain to them. They desired that this university "should furnish all the resources for original research for graduates and specialists." They desired "that the instruction in letters and sciences should be carried as high as possible, believing that in education there can be nothing superfluous." In pious remembrance of their son they gave his name to this university, and in 1884 they offered the legislature of California the sum of $30,000,000 to establish it.

This private initiative, this self-confidence and clear and downright will, are what most strike the foreigner on his arrival in the United States.

We must not think, however, that everything at Chicago was better than in other countries. I am not one of those travelers who can not see anything abroad without falling into ecstasies over it and calling it a miracle. I do not like too ready admiration, nor systematic disparagement either. I know very well that with plenty of money you can build palaces; but I also know that a palace does not constitute a university.

The citizens of the United States have their difficulties as we have ours. They have their secession experiments; weakening of the race by excessive will power; a questionable distribution of wealth; difficulties in domestic and political life. But they have a clear perception of obstacles to overcome.

They wished to create centers of intellectual culture and patriotic initiative, and they have succeeded admirably. I admire that effort.

How much talk of decentralization there has been in France in the last thirty years. I have heard many an orator repeat earnestly the discourse on this subject which we all know by heart, and when, the next day, this man of strong convictions was asked for a subscription for some useful work he would perhaps give a few cents with an ill grace, and grumble, "Why not apply to the Government for

Digitized by Google

assistance? It would be much simpler." If we really want decentralization we must give our money, our time, and our hearts to independent works.

It seems to me that the moment has come for us, too, to show our initiative. It seems to me, from certain precursory symptoms, that the new generation will be more active than ours. I mean it will have a more efficacious if less deliberate activity.

Our universities are being rejuvenated and reformed by a new law. They can own and manage their property in full liberty and augment or form new instruction. They can make new degrees. They receive the larger part of the students' fees. They choose their professors, for if the State has preserved the right of nomination, the minister, most of the time, merely confirms the choice of the universities.

This new law reunites and groups together all the different branches of instruction of our faculties. The creation of free courses allows anyone to be a professor. The liberty of lecturing has rejuvenated education. The students' societies which have been formed about our schools give an esprit de corps to our pupils. Finally, we now have the indispensable condition for augmenting and enlarging scientific research, viz, laboratories and liberty.

Now let private initiative come to the aid of our universities, and rich as they are in the traditions of a long past, and rich in the habits of work, their social importance will also increase.

Now that the apparatus of our universities has increased, we must increase our scientific productivity.

To give young minds a taste for research is to increase their curiosity and develop their initiative. It shows them how to overcome or avoid difficulties and teaches them what the imagination can expect from the experimental method. At the same time it opens up new horizons for them. When one is once possessed by the love of a science there is no greater pleasure than in advancing it.

For twenty years we have been giving too many degrees and have done too little original research.

The reform of our education answers the question that the president of the University of Chicago put to me. Henceforth our laboratories shall be open to foreigners as in the past. But to-day our universities can give the degree of doctor to all these whom the love of science draws to us and who come for advice and direction in undertaking new discoveries.

These are important results. If at the same time we can preserve the literary form, which is the charm of our education and one of its forces, if we can preserve that limpidity and clearness which is a French characteristic and will always be our best portion, our universities will become glowing centers of intellectual light, and we shall no longer need to envy even the University of Chicago.

UNIVERSITY EDUCATION.[1]

[Address delivered at the Johns Hopkins University, Baltimore, October 11, 1897, by Dr. MICHAEL FOSTER, Sec. R. S.].

The Johns Hopkins University, which has done me the honor to ask me to say a few words on this occasion, is, although already distinguished, a new and young university. I can remember well its beginning, and as Dr. Gilman has hinted, I may claim to have taken some small part in its birth. When I moved in 1870 from London to Cambridge, I took with me a bright lad of whose ability and industry I had already taken notice. At Cambridge he became my right-hand man, and I had some hopes that I should long have his help; but President Gilman appeared upon the scene, and his influence was so strong that I felt that my own

[1] Reprinted from the Bulletin of the Johns Hopkins Hospital, April, 1898.

Digitized by Google

interests were not to be considered, and that I ought to send that favorite across the waters to occupy the first chair of biology in this new university. Although the memories of him whom I need scarcely name, Henry Newell Martin, are tinged with melancholy, still I feel that this university must always look back with pride and affection on the work which he has done in this country, and in this affection and pride I claim a small share for myself.

Your university is a new one. I come from a very old one; one which was founded six hundred years ago, which has lived through all those centuries, and which, though it has some of the charms, has also some of the evils of antiquity. The traditions of the past weigh heavy upon us. When we attempt to stretch our limbs to meet the new needs of new times we find some old written law, some well-established prejudice, some vested interest preventing our full development. You are a new university; and although I have purposely refrained from refreshing my mind as to the exact status of your regulations, and as to how far you may have already entangled yourselves in the toils of enactments, still I will take it for granted that you differ from us in the freedom with which you can move forward toward the needs of the coming times; and I think perhaps I could not do better at the present moment than to use the opportunity offered me to take my old university as a text, and to draw from it and its history some few plain reflections which I hope may be practical and useful with regard to the conduct of universities. Although I understand that I have been especially invited by the medical faculty, I will take leave to treat only of general things, since the welfare of the medical faculty is bound up in that of the whole university.

The morphologists tell us we can learn much by studying the embryo, and something perhaps may be learned by looking back at this old University of Cambridge in the days of long ago—in the days when it, too, was a relatively young university. Things were very different then from what they are now. The dimly lighted streets or alleys in which the students lived were an emblem of the whole university. There was little outward show of glory then; there were no beautiful buildings, few books, and each student's duty was, in part, to listen to the lecture, to the reading of something which was written, but which he could not see with his own eyes. In spite of all these difficulties there were certain features of the university of that time which I trust I may say have been, with some little wavering here and there, maintained since, and which I can not help thinking have contributed in very large measure to make it what I may venture to call it, a famous and great university.

One of the most striking features of the attitude of both students and teachers at that early time was that they recognized in the training of the university a preparation for practical life. There were at that time three main occupations in which learning was of practical use; and in correspondence to those three occupations there were established the three great faculties of the university—the faculty of theology, the faculty of law, and the faculty of medicine. And, if one reads what those men of old wrote concerning what they thought ought to be done in the university, one is very much impressed by the conviction which they had that the teaching should be an earnest preparation for practical life. If it soon became necessary to establish a fourth faculty, the faculty of arts, that was simply as a faculty preparatory to the others, as one supplying the first steps for and leading up toward the knowledge which should be of use in practical life; and it is worth noting that although they called that faculty the faculty of arts, and although the acquisition of the Latin language was one of the chief studies of that faculty, necessarily so because all the instruction which could be given was given in that tongue, among what they called the arts were the beginnings of the kind of knowledge which we now call science.

Another feature of the university life of those early times was the very strong feeling that the work of the university consisted not in the mere acquisition of

Digitized by Google

knowledge, but in the training of the mind. The amount of knowledge which they had for distribution was very limited; but they used that small stock of knowledge to the very best of their ability, as the means of awakening the minds of the students and training them for thinking and arriving at conclusions. This is seen even in what they called at that time examinations, though the word then had a very different meaning from what it has now; there were then no written examinations; there was not that demand on paper so characteristic of modern times, and that great necessity of modern civilization, the waste-paper basket was unknown. The examiners went quietly to work to ascertain in the most sure way whether a student had profited by what he had listened to. Instead of having two examiners for some hundreds of students, they appointed nine to each student; and these went in with him and out with him until they satisfied themselves that he knew something, and had gathered something from what had been told him. And then as a final test they put him on the "stool" and made him debate in public, the test being used in such a way as to bring out his stock of knowledge, and especially his power of using it and of showing that his mind had been trained at the same time that he had gathered in a certain number of facts.

There was another feature of the university which we sometimes find difficult to realize: the spirit of inquiry was rife among them. At that time the ways of thinking were devious; but still within the limited circle in which they moved, along the only lines then open to them, the thinkers used their minds in the spirit of free inquiry. When one reflects upon the circumstances in which they worked, one can not help realizing that their long-drawn-out discussions were at the bottom an expression of the love of inquiry, and that if they had had the advantages which we enjoy now, that which we call their subtlety would have broken out into discovery and invention.

Lastly, it was a feature of the university at that time that it was willing to take into its bosom anyone who showed that he had any promise of benefiting by the instruction there given. It was an open home for all who wished for learning.

These are some of the features of the University of Cambridge in the olden times; and may we not, using them as a text, attempt to draw some conclusions as to what are the proper and essential functions of a university, and what ought to be some of its guiding principles? As I said just now, the knowledge which they possessed was extremely limited, the facts with which they had to deal were very few. What can we say of knowledge at the present time? May we not say, if theirs was too little for them, ours threatens to be too great for us; that we are entering upon an age in which the facts which have to be learned, and the various kinds of knowledge which have to be acquired are becoming too many for us? It is, or it may be perfectly true that one of the advantages of learning is that it enables the learner to learn more rapidly; but is not this true, notwithstanding, that the increment of knowledge is increasing far more rapidly than the increment of the power to learn? Is it not a serious matter for consideration that the things that the university has to teach are rapidly becoming far too numerous for the learner to learn? Is it not true that we can not do now as they did in those old times, teach the student all that was known? We are compelled to make a choice; we must teach to the student some things and omit to teach him others. That is a necessity which it seems to me is increasing as the years go on. Nevertheless, that position is a cruel one; for it may be truly said that every kind of knowledge has a value of its own; each kind of knowledge has for the learner a value which can be given by no other kind, and he who fails to gain any one kind of knowledge is thereby a loser. For building up the student into the full and complete man, the best course would be to take in all the knowledge which can be offered by a university; but, as I said just now, a choice must be made, and the consideration of the principles which should guide the decision as to what should be chosen and what should be left, demands the most serious attention. Here I think we may

Digitized by Google

venture to follow the example of the old university. Admitting that each kind of knowledge is particularly fitting for a particular calling; that for every particular calling in life there is a knowledge, or there are kinds of knowledge which are suited or fitted for that calling, and without which that calling can not be pursued with success, in the necessary choice which must be made between this study and that, is it not a wise course to take that which best serves the future calling of the student? I can not but think that in this choice of which I am speaking, the arguments for what is sometimes called technical education are unanswerable; that one of the principles of most importance in determining the choice of the studies to be taken up by the student lies in the fitness of the study for giving him power in the calling which he proposes to adopt. We must, however, remember that the knowledge which is thus to be imparted to him must be not merely a knowledge of facts, but bring with it the power ot thinking. If technical education is understood in this way, not as a mere accumulation of facts, not as the mere heaping of knowledge, but as the training of the mind in some particular kind of knowledge, the dangers, I venture to say, which some fear will prove unreal, and it will be seen to be a true principle of university education.

There is another aspect in which we may look at university duties. May we not say that the tendency of modern civilization is to smooth down individual differences, and that the whole tendency of the environment of man is to make each man increasingly more like his brother? There was a time when one could tell by the dress where a man came from; but this has become less and less easy, and it is not in dress alone, but in his very nature that man all over the world becomes more like his fellows. I myself during the short time I have been in this country have felt it more and more difficult to tell what are the differences between an American and an Englishman, and I trust that these differences are equally difficult to you. This may be a favorable aspect, but there is an unfavorable side to this continual influence of things about us. Mr. Francis Galton has shown that there is a great tendency in things to make men more and more alike in stature, and there seems a corresponding tendency to make men all alike in the stature of their minds. We seem tending in many ways to a monotonous mediocrity of intellect. This influence is especially strong among young people. I see for myself in the University of Cambridge that when one young man does one thing they all do it; they go astray like sheep, and they also go straight like sheep. Surely it ought to be a function of the university to counteract this tendency, and so to bring the influences of learning upon the young as to develop individual differences. That, I take it, is one of the most important functions which a university can exercise, but one which is not always kept in view in university enactments. Here I can speak of my own university, and in doing so can lay the blame for the present condition of things on the traditions of the past. I find in my own university discouragement for the development of individual power. Every lad who comes to the University of Cambridge is compelled to pass through the same examination, to know the same things to the same extent, whatever may be the nature of his mind. He must know a little Latin, a little Greek, a little mathematics, a little history, and one or two other subjects. Each one who comes, whatever his previous history, must pass through this one gate; the whole university has been pushed through this one common gate. Now, I know that this may be defended. It may be said, for instance, that it is a bad thing not to know Latin. I quite agree with that. I think it a very bad thing not to know Latin; but I also think it a very bad thing for a lad to be thrown into life, it may be to go through life, without any clear idea whatever of the fundamental laws which govern the phenomena of living things. It may be said that it is a bad thing not to know Greek. I agree with that. Not to know Greek is to my mind worse than not to know Latin, but I think also that it is a bad thing for a lad to go through

Digitized by Google

life ignorant of the fundamental laws of chemical action. If you go along in that line of argument, you end by compelling a lad to know everything before he enters the university. If I had my way, and could wipe out the traditions of the past, I should vary that entrance examination. I should hold on to the old tradition of the university that it was ready to receive everybody who was likely to profit by its instructions. I should make the examination look, not backward as it does now, but forward, and should only insist that the lad must give such proofs of intelligence and industry as to lead to the hope that the years of university life would not be spent in vain. When the lad has really entered the university (at times he does not do so until he has spent two or even three years at the place in preparation, and sometimes goes away from the place without having really been admitted), it seems to me there should be a still wider scope for his studies. He has even now, it is true, an opportunity to take a degree in one or other of several branches of learning, but in each case he must follow out a particular schedule which has been laid down, and which compels him to walk along a particular path and no other. If he wishes, for example, to study mathematics with philosophy, he would find that he could not do so, for in the examinations mathematicians have nothing to do with philosophy, and philosophy nothing to do with mathematics; and so in other things. I venture to think that this is not a satisfactory condition of things, and that throughout the whole academic course there should be a freedom of the young mind to develop in the line in which it was intended to develop. When I urge this upon my friends they all say, "It is very good, but it is impossible; the examination machinery would become so complicated as to break down." But I would ask the question, Are examinations all in all? Were the examinations made for universities, or were universities made for examinations? I myself have no doubt about the answer. I trust that this new university, which can walk with freedom along new lines, will find some way of so arranging studies and examinations that the two will not conflict, and that anybody coming here will find that the particular gifts that have been given to him, and which it was intended should be developed, will meet their fullest expansion.

Lastly, there was another feature which the old university possessed and which I may also call an essential feature of a university; that is the spirit of inquiry. No university can prosper as a university that not only does not do its best to favor special inquiries when these are started within it, but also in the whole course of its teaching does not develop or strive to develop the spirit of inquiry. Now, here again, I fear that examinations—such, at all events, is my experience—are antagonistic to inquiry; and I would suggest that in arranging examinations one ought always to look ahead to see how far one can possibly order those examinations so as to favor the teaching which teaches in the real and true way—teaching by regarding each bit of learning as in itself an act of inquiry, and so as to favor in the highest degree actual inquiry when it is taken in hand. This of course is antagonistic to one function of examinations, namely, that of putting young men to compete against each other. You can not so judge inquiries as to put the inquirers in any class list or in any order; the most you can do is to give an inquiry the stamp of approval of the university, a testimony that the inquiry has been carried out in a satisfactory way. It is true that in this way you lose that which is sometimes thought to be of great value, emulation between the scholars; but if you take away that kind of emulation you substitute for it another one far more strong and effective, that emulation that comes of striving with nature. I take it that the good which is done to a lad in starting him upon an inquiry is infinitely greater than any which can be gained by competition with his fellow-students. Here I am glad to say a good word for my own university; for we have in a very quiet way, and unobserved, secured the adoption of an enactment which allows a lad to enter the

Digitized by Google

university and obtain his degree and all which follows upon that without entering into a single examination. At the present moment it is possible for one—it is true, under exceptional circumstances—to come to the University of Cambridge in England, and if he convinces a competent body of judges that he is a person likely to carry on inquiry in a successful manner, he can enter the univeristy as a student; and if he satisfies another body of men after a time that his inquiries have resulted in a real contribution to knowledge, he can secure his degree. He can get that without ever having touched a written examination paper, and I am proud that we are able to offer that to the world; for it has happened again and again that a man who had real genius for a particular line of inquiry stumbled over the preliminary studies of which I have spoken, knocked at the door of our university in vain and was sent away. Now such an one would be admitted, and I venture to say that in the long run the university will be the gainer.

These, then, are some few thoughts concerning universities and their methods. I say I have purposely learned nothing about your enactments; but from what I know of your short past I feel confident that this university will in the future be conspicuous for progress. May I hope that it will carry on education along some of the lines which I have indicated to-day, and perhaps some day we in the old country may mend our ways after your pattern.

THE UNIVERSITY OF TURIN

[By M. HAGUENIN.[1]]

The university year lasts theoretically nine months and a half, from October 15 to July 30; but this includes the examinations. The lectures do not begin until the early part of November and end June 15. They really last, then, a little more than seven months. From this must be deducted the vacations, Sundays, and holidays, twelve days for Christmas and New Years, eighteen days for the carnival and Easter, the national holiday, and the birthdays of the king, the queen, etc., so that only one hundred and fifty days are left for study. This time is also often abbreviated by parades, insurrections, and strikes of the students, who are anxious to prolong the vacations and insist on having their dignity respected.

ORGANIZATION OF INSTRUCTION.

The licenza liceale (the equivalent of our baccalaureate, with the exception that the professors do not pass upon it) confers the right of inscription at the university and of obtaining the inscription book in which is certified the payment of dues and fees and the attendance of the student at the obligatory courses. By virtue of the inscription and the observance of these conditions the students can pass the "special examinations" and apply for the academic degrees.

Special examinations are those which are restricted to a single "discipline" or study, and comprise the programme approved by the faculty at the beginning of the year, or, in short, the programme that the professor proposes to follow in his course. These examinations take place either at the end of the year or, when the matter studied is distributed over several years and forms a whole not easily divisible, at the end of the total course bearing on this subject. After the student has passed the special examinations in all the matters prescribed he obtains the certificate of license.

Besides the special examinations, and following all of them, there is an examination of "laurea," which corresponds to the doctorate as they understand it in Ger-

[1] M. Haguenin represented in his mission the Société d'enseignement supérieur. This account is translated from a communication of his to the Revue internationale de l'enseignement, April and May, 1898.

Digitized by Google

many. In order to be admitted to the "laurea" examination the student must have attended the courses of the faculty during the prescribed number of years (medicine and surgery, six years; jurisprudence, four years; physical, mathematical, and natural sciences, four years; philosophy and letters, four years; pharmacy, four years), and have passed the special examinations in all the obligatory matters. This examination for "laurea" consists in the discussion of a principal dissertation written by the candidate upon some thesis selected by himself and other less important theses, and in one or more practical tests. All examinations are public.

THE UNIVERSITY PERSONNEL—THE PROFESSORS.

The government of the universities belongs, under the supervision of the minister and in conformity with the laws and regulations, to the following authorities:

(1) The rector (who has charge of the clerical force and the treasury), who is elected for ten years and is taken from each faculty in succession.

(2) The academic council.

(3) The president (dean) of the faculty.

(4) Council of the faculty.

(5) General assembly of the professors.

The official instruction of the professor takes the double form of lectures and discussions. He may devote a part of each lecture to a colloquy with the students.

There are liberi docenti, extraordinary and ordinary professors, and chargés de cours.[1]

One can not become an ordinary—that is, full—professor without having been a professor extraordinary. The professorships are filled either by considering the known merit of the applicant (titres) or upon examination. Among the titles (proofs of the instruction he has given and copies of his publications) there must be at least one original printed memoir on a subject pertaining to the science in which the chair to be filled gives instruction. For the chair of Latin or Greek the memoir must be in Latin. These "titles" are submitted to a commission of five members, selected as follows: Each ordinary professor of the faculty or school to which the chair to be filled belongs proposes five names, selected from those of professors who have taught, or savants who have cultivated, the part of the science in question. The ten names which have obtained the greatest number of votes are published in the official bulletin of the ministry, and among these ten names the minister selects the five members of the commission; but for "special reasons" he may increase the number by two or four, and take these supplementary commissioners from outside the ten names given him.

The commission then proceeds to the examination of the titles, and votes by secret ballot (yes or no) upon the eligibility of each candidate. By open voting it assigns their rank to the candidates who have been declared eligible and their points of relative merit.

If the commission judges that the titles presented do not allow of a decision as to eligibility or to classification it proceeds to an examination, which consists of (1) a discussion maintained by each competitor upon one of the printed memoirs, which must last at least an hour for each competitor; (2) a lecture of at least forty minutes in length; (3) one or more practical experiments, if one of the experimental sciences is the subject of competition.

The results of the examinations are judged, conjointly with the titles, by a single vote. A report of the examination is sent to the superior council, which adds its own comments to it, and it is then printed in the official gazette.

[1] The salaries are, for a professor extraordinary, 3,500 lire ($700), 3,000 lire ($600), down to 1,250 lire ($250); ordinary professor, 5,000 lire ($1,000), with an increase of 500 lire ($100) every five years until 8,000 lire ($1,600) is reached; for a chargé de cours, 1,250 lire ($250), and for a libero docente, 12 lire ($2.50) per student

Digitized by Google

A professor extraordinary can become an ordinary one either at his own request or by the proposal of the faculty. The minister submits the request or proposal to a commission appointed as above. Professors extraordinary can be promoted to ordinary, provided (1) that they have been professors extraordinary for at least three scholastic years consecutively; and (2) that they present new scientific titles and give evidence of their ability to teach.

The liberi docenti acquire the right of teaching either by titles after due notice from the faculty to the superior council and a favorable decision by the latter by a two-thirds majority, or by an examination which consists (1) of a dissertation upon a subject proposed by the examining committee and which the candidate is allowed three months to prepare; (2) of a discussion of at least one hour's length upon this subject and upon the part of science which he is to teach; (3) of a lecture of at least forty minutes in length upon a subject proposed by the commission. The candidate, in order to be judged fit to teach, must obtain at least two-thirds of the whole number of marks.

Finally, ordinary or extraordinary professors may be chargés de cours (but only of one course outside of their own); so may doctors who are fellows of the faculties, the liberi docenti, etc. The minister appoints chargés de cours on the nomination of the faculty, if obligatory instruction is in question, and on advice of the faculty and superior council in case of private instruction.

The University of Turin is the second in the kingdom for the number of students. It had 2,021 on January 1, 1893, and 2,434 January 1, 1896. The increase is constant and, as it seems, proportional to that of other universities. It is therefore due to a general increase of the university population and to the desire which is more and more diffused of occupying places which are growing less and less numerous. The 2,434 students for 1896-97 were divided as follows: Medicine and surgery (six years), 741; law (four years), 631; physical, mathematical, and natural sciences (four years), 338; letters and philosophy (four years), 205; course of notariat and procedure (two years), 64; course of pharmacy (laurea four years besides practica one year, or diploma three years besides practica one year), 245; obstetrics for midwives (two years), 191; special hearers, 16.

I have studied the annual catalogues of the University of Turin and have found material for statistics which I give below:

FACULTY OF MEDICINE AND SURGERY.

	1892-93.	1893-94.	1894-95.
Number of students	654	708	733
Number of special examinations during summer and autumn	2,242	2,618	2,526
Successful	2,010	2,113	2,042
With simple approbation	1,284	1,430	1,330
With full number of legal votes	523	492	503
Absolutely full number of votes	162	159	194
With praise	31	23	25
Candidates for laurea	87	95	80

FACULTY OF JURISPRUDENCE.

Entered for the laurea	589	644	661
For degree of notary and procureur	48	52	52
Special examinations, summer and autumn	2,812	3,146	3,036
Successful	2,454	2,816	2,560
With simple approval	1,948	2,232	1,913

Candidates for laurea in letters	16	27	22

These statistics show that the average of success is about 83 per cent and that of failures 17 per cent. These averages would surprise a Frenchman, and seem to indicate a good deal of indulgence on the part of the professors. It is possible, indeed, that the independence of the professors in regard to the candidates may not be perfect. They can not forget that they are their students. They know them too well and know that too great severity might provoke revolts, against which the higher authorities would not sustain the professors, or at least lead to unpleasant antipathy. On the other hand, the prosperity of the university might suffer from too great severity. All this is true or probable, and from this point of view the want of State examinations or of general examinations common to all universities, conducted by a jury which is free from all local influence, makes itself felt.[1] But it should be remembered that on account of the close relation between the examination and the course—the limited field which has been gone over by the professor determining the extent of the examination—the preparation is easy, and, so to say, too easily completed. The student has only to listen. A little attention is all that is necessary, and the memory is more called upon than the intelligence. That is why these averages prove less than one would believe, and are against the professors and in favor of the students. If the success is too easy, the fault lies with the organization of the instruction.

There is more than one occasion for criticism, notably in the distribution of the different courses. The great principle which rules the university is that of liberty both for the professor and the student. This liberty does not accommodate itself to a useful system of examinations, which carries with it the requirements of regularity. The professor gives what lectures he chooses and the student follows the ones he likes, on condition that he enters his name for the year in at least three obligatory studies, each calling for three lectures a week of an hour each. Besides,

[1] This comment is interesting, as indicating the grounds on which a French professor would defend the system of State examinations in his own country. (AM. ED.)

Digitized by Google

the attendance required by law is only so in appearance, few professors insisting upon it, but they sign the attendance book when it is presented to them. They can, however, refuse to sign, and when the column of the book called attestato di diligenza (certificate of diligence) is blank the student is obliged to reenter his name. In order to help students in selecting their obligatory studies the council of the faculty draws up an order of studies, with the hours of each, which the students are not obliged to follow, but to which they usually conform to avoid troublesome combinations. The order [1] for the faculty of letters and philosophy for 1897-98 classes together the students of letters and philosophy for the first two years (1° biennio), but they are separated afterwards (2 biennio).

The atmosphere in which professors and students move is not a matter of indifference. Turin is a city which would be called quiet rather than dull, with its great patrician houses, wide squares and long, straight streets, at the ends of which arise snowy mountains or hills "with verdure clad." It is Versailles full of life. It has lost the name of capital city, but preserves the prestige and beauty of one, and the glory remains to it of possessing a great number of institutions of charity and of learning, which is its most striking feature, if we look beyond its regular and imposing physical aspect. Whether we judge it from the heart or the mind, it is one of the "strong places" of Italy, as the Italians say and believe. My province is to speak only of instruction as I saw it there. Turin has a royal academy of sciences (physical, mathematical, and natural sciences forming one class, and moral, historical, and philological sciences another class), medical societies, engineering societies, etc., a philological club, and a society for the study of foreign languages and instruction therein. It is the center of a club of the Italian League of Education. It has schools of higher instruction—the royal school of applied engineering, the royal Italian industrial museum, an agricultural school, military schools, together with laboratories and clinics, among which is the psychiatric institute of Cæsare Lombroso. In secondary instruction there are a technical institute (a kind of institution for modern education), three lycées, six gymnasiums (a grade below the lycées), five technical schools (professional), a business college, a national boarding school (internat), a woman's normal school, and even a

[1] (1) Biennio of the course of letters and philosophy: First year, Italian literature (Graf), Tuesday, Thursday, Saturday at 3 o'clock; Latin literature (Stampini), Monday, Wednesday, Friday at 3; geography (X), Monday, Wednesday, Friday at 2. Second year, Italian literature, Latin literature, same as in first year; Greek literature (Fraccaroli), Tuesday, Thursday, Saturday at 10; comparative history of the classical and neo-Latin languages (Pezzi), Tuesday, Thursday, and Saturday at 9; ancient history (X), Tuesday, Thursday, Saturday at 11; modern history (Cipolla), Monday, Wednesday, and Friday at 10; theoretical philosophy (d'Ercole), Monday, Wednesday, Friday at 11.

(2) Biennio of the course of letters: Third year, Italian literature, Latin literature, same as in first and second years; Greek literature, ancient history, modern history, same as in second year. Fourth year, Greek literature, same as in second and third years; archeology (Ferrero), Tuesday, Thursday, and Saturday at 2; history of philosophy (Bobba), Monday, Wednesday, and Friday at 9; comparative history of the neo-Latin literature (Renier), Monday, Wednesday, Friday at 2.

(2) Biennio in philosophy: Third year, Italian literature, Greek literature, same as above; ancient history, same as second and third years in letters; theoretical philosophy, same as in second year; history of philosophy, same as fourth year in letters. Fourth year, history of philosophy, same as fourth year in letters and third in philosophy; moral philosophy (d'Ercole), Monday, Wednesday, Friday at 2; pedagogics (Allievo), Monday, Wednesday, Friday at 4; general physiology (Mosso), Monday, Wednesday, Friday at 5.

Complementary course: Greek and Latin grammar (Valmaggi), Tuesday, Thursday, Saturday at 4; Egyptology (Rossi), Tuesday, Thursday, Saturday at 4; Persian and Sanscrit (Pizzi), Monday and Wednesday, Thursday and Saturday, Tuesday and Friday at 4; Semitic languages (Arabic and Hebrew) (Pizzi), Wednesday and Friday from 9 to 11.

Private instruction: Ancient history (Garizio), Monday, Wednesday, and Saturday at 5; Latin literature (same), Monday, Wednesday, and Friday at 4: Greek literature (Zuretti), Tuesday, Thursday, and Saturday at 4; Latin literature (Valmaggi), Tuesday, Thursday, and Saturday at 5; French language and literature.

Digitized by Google

normal school of gymnastics for women, in which the theory and practice of gymnastics are taught, including anatomy, physiology, and hygiene, pedagogics, history, and singing. In primary instruction I counted some 20 city schools, 26 suburban, 14 evening schools, besides an evening commercial school, evening schools for drawing, etc. There are, besides, some 30 private schools for boys and 40 for girls.

This state of things shows a culture which is widely diffused, if not profound, and manifests a lively interest in everything that concerns knowledge and education, and superior education ought to feel the stimulating effects of such surroundings and feel itself supported by them. Certainly the professors work, and work hard, and their publications are numerous. The professors, both by their number and quality, show the intellectual current of contemporary thought in Italy. This is manifested in the first place by a breadth and quickness of intelligence which come from climate and race, the desire and power to take an interest in everything, a kind of natural "general culture;" and, in the second place, by a preference for history and the historical point of view, and, finally, by a decided taste for monographs. These tendencies can be criticised, and it may be said that one of them indicates too great ambition and the others too much modesty; but it can be replied that the first is always praiseworthy, and the two others are justified by success.

THE STUDENTS.

I am everywhere told that the students are recruited from the less well-to-do classes of the bourgeoisie, and that their object is to gain as soon as possible a chair in some gymnasium or lycée. They can secure a remission of fees and obtain subsidies from the "Collège des Provinces," the Collège Caccia for the province of Novara, and from private legacies and institutions, by virtue of certain certificates and examinations. The Collège des Provinces distributes 70 lire ($14) a month each to some forty students during the nine months of the scholastic year. The written examinations which the competitors for this subsidy undergo consist in a Latin and an Italian essay (one of which must be historical), one on some philosophical subject, a Greek translation, problems in arithmetic and geometry and in physics. Each of these tests requires four hours, including the dictation of the subject, and the whole examination occupies three days; whereupon the oral examinations take place upon the subjects of the written, or upon the programme of the licenza liceale; the competitors must have an average of 70 per cent in the written and oral examinations separately. When students come to the university they already have the licenza liceale, the examination for which includes the three literatures, modern history, philosophy, and the physical, mathematical, and natural sciences. What do this examination and the studies at the lycée amount to?

To speak of only two points, it is certain that the philosophical knowledge of the young students is entirely insufficient, although they should have been instructed during the three years of the lycée. As to Latin, they have never written Latin compositions and have not even translated from Italian into Latin. Their written exercises have been limited to the translation of easy passages from Latin authors. They have, then, much, if not everything, to do at the university. Do they work there? You can see them promenading under the arcades of the great Piazza Castello or along the Via Po, where the university is situated. They rarely have a book or notebook in their hands. They are never in a hurry, and talk together without much animation, for the Piedmontese are rather quiet. In the court of the university, to which its marble busts give an imposing air, and in the gallery of the first floor they have the same appearance. The type of the "good student" does not appear. I watched them in the lecture room of Professor Graf. The room was full. There were many students—quite

Digitized by Google

a large number of young women, also students for the most part[1]—besides a dozen adult or elderly men and a few priests. The professor, whose subject this year was the general introduction to the history of the neo-Latin languages, spoke eloquently of Rome and the Barbarians. His authoritative position, for he holds a veritable chair of learning, gave effect to his words. The students listened with moderate attention, only about twenty out of the whole taking notes, and these were young women. One student was reading a newspaper under his overcoat, and a young woman was reading a book concealed by her arm; but we must not judge them by these appearances. If only a few take notes, it is because they do it for all, and afterwards publish, with the professor's consent, lithograph copies of the lectures, or summaries of them. It is true, nevertheless—and the professors say so themselves—that the students do not work hard. Their object in attending the university seems to be not to gain instruction, but to pass easy examinations and profit by the advantages which will accrue from them. The fault here lies in the organization of the instruction. They have never had the idea of making the students exert themselves and of affording them the means and opportunity of responding to and sharing in the instruction they receive. The professors might profitably devote some of the time of their lectures to hearing discussions among the students. Thus, Professor Pezzi, as far as classical philology is concerned, gives his students Henry's Comparative Grammar, and every Saturday a student gives an account of what he has read of it; and Professor Stampini does the same occasionally on some point in Latin literature.

But most of the professors seem to consider it their duty to occupy their lecture hours with their own labors, and they do not believe that they can count upon the good will of the students for work that is not required by the rules.

This lacuna is, unfortunately, not filled by the establishment in each university of a scuola di magistero (school of discipline). This is an ensemble of discussions which the students can attend by entering their names for a whole year, after completing the first biennio and passing the examinations belonging to it. After two years, students who have attended the discussions and have obtained the degree of laurea, can have a degree called that of magistero, which has a professional value. For the faculty of sciences there are four groups of discussions, viz, one each of physics, chemistry, natural sciences, and mathematics. For students of the faculty of letters there is a common discussion of didactics in general, and three sections, viz, literature (Italian, Latin, and Greek), history (ancient, modern, and geography), and philosophy, including pedagogics. There is a degree for each of these sections, and a student can not be entered in more than two sections at once. But too few students trouble themselves to attend these discussions. Besides, there are too few of them, and the advantage of attending them is not clear. Formerly they initiated the students to scientific methods, but nowadays they are entirely devoted to pedagogics. At all events, certain professors see in them a means of supplementing their lectures, and use them for making a more special course. Finally, the students do not permit anyone to demand too much application from them, and when they do it is a question how to utilize this application. They do not, as a rule, know modern languages, except in Piedmont, where French is understood. It is, therefore, difficult, particularly in the domain of philology, to get any good out of their work.

I was able to test the result of four years of university studies for students in the faculty of letters, and attended a dozen examinations for laurea. The examining committee was composed of eleven members. One of the members reports upon the thesis of the candidate, who listens, seated at a small table. After five

[1] Female students are quite numerous (at Turin) and come from the same lycées with the young men. They have the same rights. Most of them enter the faculty of letters. They usually intend to become teachers in secondary instruction, particularly the normal schools, but some of them occupy chairs in technical schools and lycées. The conduct of the female students at the university lectures, a professor told me, is usually correct.

Digitized by Google

or ten minutes of reading, the candidate answers and discusses with the reporter. At the end of fifteen minutes at the longest the president strikes a bell and closes the discussion. Each candidate presents three theses, and in three quarters of an hour at most he is made a doctor. Here are some of the subjects: The commerce of Genoa at the time of her supremacy. Music and the other elements of the opera. Has Cicero a philosophy? Origin of the Gens Romana. Did Rome dominate over Etruria? Can Mary of France be identical with Mary of Compiègne? Family sentiment in the poems of Catullus. The cosmogony of Moses and modern science.

The candidate who dealt with the last subject said: "For Moses, God was a spirit; for modern science, He is material." Another, *à propos* of a historical subject which he was found not to have treated thoroughly, remarked: "I did not mention that part of the subject because it was not treated in the books." The manuscript theses, of very diverse importance, vary between some forty pages and two or three hundred. Some are very brief; e. g., in an essay on a verse of the Miles Gloriosus, the candidate remarked: "We must here refer to authentic manuscripts." "What are they?" asked the professor. "I mean those written by the author himself," was the reply. Some candidates discuss with accuracy and good taste. Most of them speak with animation and manufacture fine phrases, place stress upon the words they employ, show little care for truth, and insist obstinately upon their own meaning, while others do not respond to the questions at all and yet get the laurea. An excess of good nature seems to prevail in these examinations. If the professor touches upon a fault of the candidate, he does not press it, and if the candidate does not speak, he speaks himself. He understands that the candidate is not fully responsible. The preparatory instruction before entering the university is often faulty. This defect explains certain weaknesses common to all the students, and the great reproach of all the theses, viz, that they lack skillful composition, the idea (if there is one) often not appearing until the last page, and there is no gradual preparation for it, or leading up to it.

To sum up: The students work little, at least in the faculty of letters and philosophy. I understand that they work harder in the faculty of law. There are two or three causes of the low results I have mentioned. The university organization is very imperfect; the professors have too little immediate relations with their students, and perhaps what there are would be considered too familiar. Finally, politics occupies and disturbs the young Italians; and it is only necessary to read the newspapers to see what an excessive importance is attached to their extrauniversity manifestations. How can energetic and noteworthy professors come from such students? Of course, there are exceptions, and the student sometimes works best when he is no longer a student. According to an Italian saying, a student is a young man who enjoys himself a good deal and never works. The saying exaggerates, or, at any rate, can only apply to a short time, for there are no old students in Italy; twenty-four years at latest is the limit of his stay; and then begin his real studies.

THE LABORATORY OF POLITICAL ECONOMY OF THE UNIVERSITY OF TURIN.

One of the most recent and most active institutions of the University of Turin is the laboratory of political economy, which is annexed to the faculty of law and conducted by the professor of political economy, assisted by a "coadjutor" and two assistants, neither of these positions receiving any salary. The university students are admitted to the laboratory as scholars, while the laureati and persons who have no academic titles are entered as soci residenti. The director contributes 30 lire ($6) a year, the coadjutor 15 ($3), the assistants 10 ($2), the soci residenti 10, and the scholars 5 ($1), which sums are exclusively for the benefit of the laboratory, the object of which is defined to be to encourage and facilitate the scientific study of the phenomena of economics and of the questions connected therewith The soci residenti have the right to frequent the laboratory, while it

Digitized by Google

is the duty of the students to do so, and both can use the scientific material of the laboratory for their work.

The practical exercises of the laboratory "have for their object to give or supplement scientific education, and eventually to facilitate original researches. They consist of papers and discussions upon selected or designated subjects relating to economical questions of a scientific or practical nature, or of critical reports, oral or written, upon visits to managements or establishments. Reports of these exercises are drawn up by the assistants."

The laboratory is open the whole year, except a short time in the autumn vacation. It can give prizes consisting of scientific works, and publish the works of its scholars and the soci when they are sufficiently meritorious.

This laboratory was founded in 1893–94 and installed in the former quarters of the laboratory of general pathology. The rooms are small and inconvenient, but the director, S. Cognetti de Martiis, professor of political economy, hopes to have them enlarged. "Meanwhile," he says "the want of space has its advantages, for it compels us to keep everything in order." The little rooms are crammed with documents, all kept in perfect order and catalogued by the scholars. This "scientific material" is divided into inquiries, bulletins, acts of Congresses, monographs, administrative reports, consular reports, statistics, atlases, annual reports on economical subjects, expositions, descriptive studies, legislation (special laws affecting industries), periodicals. I was sorry to see so small a number of French reviews. The spirit of the laboratory work is purely scientific. "Here," said Professor Cognetti de Martiis, "we have no tendencies, and, especially, no influence. In scientific matters," he added with a smile, "the only discipline possible is anarchy." This broad, scientific direction is placed under the guaranty and safeguard of the promoters or most illustrious representatives of economical science, without accepting their doctrines, and their portraits adorn the rooms with appropriate quotations from their works. Thus, under the bust of Aristotle is written (in Greek) "It is clear that the city is a natural growth and that man is a political animal"— i. e., a civic animal or citizen. Under the portrait of Vico is the quotation (in Italian) "The order of ideas ought to follow the order of things." Under that of Adam Smith "The division of labor occasions in every art proportionable increase of the productive powers of labor," and so on.

The first year there were 21 students and soci in the laboratory, 11 monographs were presented, read, and discussed, and several published, e. g., one by Prof. E. Masé-Dari on the agricultural condition of Russia; one by Dr. L. Albertini on the eight-hour question, etc. The next year, 1894–95, there were 29 inscribed, and six monographs were published, among them one by Professor Cognetti de Martiis on labor and nervous diseases; one by Dr. L. Costantino on types of rural contracts in Italy, and one by Dr. L. Einaudi on the agrarian crisis in England. There were many meetings for discussion upon publications. In 1895–96 the attendance was 34 scholars and 15 soci—49 in all, and 26 meetings.

Among the oral communications and publications were studies on the work of the labor council of Belgium, a similar work on the German commission of labor statistics, on the effects of the law of July 19, 1874, relating to the attempts of anarchists, on labor accidents, and on cooperative societies of labor.

In 1896–97 there were again 49 inscribed, of whom 22 were soci and 27 scholars. The meetings numbered 21, and among the papers and monographs were studies on the strikes at Carmaux and the glass works at Albi, on governmental inquiries into straw work in Italy, on Greek proverbs relating to economics, on the cotton industry and abolition of night work, and on the development of the system of railways in the United States and its variations.

The laboratory will take part in the national Italian exposition of 1898, with a great diagram showing the movement of Italian commerce since 1880, and a stereogram showing Italian emigration since 1876.

CHAPTER XXVIII.

STATE SUPERVISION OF DEGREE-CONFERRING INSTITUTIONS.

There are in this country a large number of institutions called universities, colleges, institutes, seminaries, etc., possessing the degree-conferring power and maintaining widely varying courses of study leading to degrees.

As the degree-conferring power is granted to institutions by the several States, an attempt has been made to ascertain how, and the conditions on which, such power is usually granted. To this end, in April, 1898, a circular letter was sent to each State in the Union asking for certain information concerning the granting of charters to institutions authorizing them to confer degrees. In reply to this letter answers were received from 41 States. Of this number it was found that in 15 States charters to educational institutions are granted by special acts of the State legislatures, in 24 States the charters are granted by certain State or county officials under a general law for the organization of corporations, and in 2 States both methods are in vogue. The following tabular statement gives the result of the above-mentioned special inquiry:

	Are universities and colleges chartered under a general law or by special acts of the legislature?	Who is authorized, under the general law, to grant charters allowing institutions to confer degrees?	What conditions or requirements must be fulfilled by institutions to enable them to obtain the right to confer degrees?			
			Concerning property.	Concerning teachers.	Concerning course of study.	Concerning admission requirements.

a It must be as thorough and comprehensive as is pursued in similar institutions in the United States.

As stated above, in 17 of the States reported on charters are granted by special acts of the legislatures. As each legislature is a law unto itself in this respect, there are no fixed requirements which institutions need meet to enable them to obtain the degree-conferring power. If the power is denied by one legislature, there is nothing to prevent the granting of such power by the following legislature.

In a large number of States the legislatures are prohibited by the State constitutions from passing special acts conferring corporate powers, but the granting of such powers is provided for by a general law for the incorporation of educational institutions. In such a general law it is usually provided that a certain number of persons, the number varying in different States, may be incorporated as a college or university by filing in a certain office or offices, usually with the secretary of state, and in some cases also with the county recorder of deeds, a certificate setting forth the name of the institution, the number of trustees, the object for which they wish to be incorporated, the location of the institution, and that it shall have power to grant such literary honors and degrees as are usually granted by colleges and universities in the United States. As a rule these are the only requirements, and on the filing of such certificate the proper officer, usually the secretary of state, issues a certificate or articles of incorporation. In but four States having a general incorporation law is there any property requirement—New York, Pennsylvania, Ohio, and Nebraska. The laws of New York and Pennsylvania differ very materially from the other general laws in force.[1] Briefly, the laws of New York and Pennsylvania provide that no institution shall receive the power to confer degrees unless it has property to the amount of $500,000, has six professors whose entire time is devoted to giving instruction to college classes,

[1] See pp. 1466–1476.

Digitized by Google

has a four-years' course of college study, and whose requirements for admission, in the case of New York, cover four years of high-school work, while in the case of Pennsylvania the requirements are subject to the approval of the college and university council.[1]

The laws of New York and Pennsylvania on this subject have received the warmest approval of the educators throughout the country, and their adoption, together with the abuse of the degree-conferring power by some institutions, have led to an agitation of the subject by educational conventions, with the hope that more restrictive legislation might be adopted by other States.

At the meeting of the National Educational Association in Milwaukee, in July, 1897, the following resolution was unanimously adopted by the department of higher education:

Resolved, That the State should exercise supervision over degree-conferring institutions through some properly constituted tribunal having power to fix a minimum standard of requirements for admission to or graduation from such institutions, and with the right to deprive of the degree-conferring power such institutions not conforming to the standard so prescribed.[2]

In a paper[3] read in support of the above resolution, President Henry Wade Rogers, of Northwestern University, after describing the steps necessary to incorporate a university or college under a general incorporation law, says:

Under laws like these institutions are incorporated as colleges and universities that are without endowment, and in not a few instances are permitted to confer degrees, although the conditions prescribed for graduation are not higher than those prescribed for admission by institutions of high rank. Institutions whose total endowment is not equal to the necessities of an academy of the first rank presume to confer the doctorate of philosophy on nonresident students, and have more candidates enrolled for that degree than they have college students in actual attendance. * * *

The cause of professional as well as of academic education suffers from the want of adequate State supervision. Professional schools have been established, generally in the large cities, which are governed by purely commercial standards. We have in this country schools of law, medicine, dentistry, and pharmacy that appear to be organized and conducted for the purpose of making money. They are stock corporations, the stock being generally held by members of the teaching force, the teachers being chosen, not for their fitness for any particular chair, but because of their willingness and ability to put up the money that is needed. The shorter the course of study, the cheaper the class of teachers, the less expended for books and apparatus, and the easier it is made to be admitted and graduated, the greater the number of students becomes and the larger the amount of the dividends paid. Men who make merchandise of professional education have low professional and scholastic ideals. They are inclined to receive all students who apply for admission, without much regard to their previous preparation or their moral character. They allow the students thus admitted to continue in their school without being concerned greatly as to the manner in which they apply themselves to study. They graduate them after an attendance for the allotted period without scrutinizing too closely the extent of their ignorance, and confer upon them a degree which in theory is supposed to stand for high attainments. This sort of thing, impossible in Europe, should be made impossible in America. Such a condition of affairs is demoralizing beyond question. The tendency of it is all in the direction of low standards. It destroys the value of degrees. It imposes on the public a class of educational charlatans and works injury to the students whom it falsely pretends to educate. It multiplies the difficulties in the way of those institutions that are endeavoring to do their work according to the highest standards.

After referring to and stating the provisions of the laws of New York and Pennsylvania concerning the incorporation of degree-conferring institutions, President Rogers continues:

There should be established in each State a council of education, which shall be intrusted with powers similar to those vested in the regents of the University of

[1] For the minimum requirements adopted by the council, see report for 1896-97, p. 466.
[2] Proceedings N. E. A., 1897, p. 700. [3] Idem, pp. 701-708.

Digitized by Google

[the State of] New York, and it should be composed of the most eminent men in the State, without any reference to political considerations. No degree-conferring institution should be incorporated without the approval of the council of education, which should be indorsed upon or filed with the certificate of incorporation. That council should have the right to fix the minimum standard of requirements for admission and graduation, and the conditions under which degrees may be conferred; and the degree-conferring power should be withheld from all institutions not complying with the regulations established. Such legislation should be made applicable to all institutions thereafter incorporated, as well as to those already incorporated, when the State has reserved the power to modify the powers conferred. It could not be made to apply to institutions already incorporated in cases where the State has not reserved power to do so.

There appears to be no good reason for doubting the constitutionality of the proposed legislation. No constitutional provision is violated by creating a council or commission, and giving it the power to decide the questions which otherwise would be left to each institution to decide for itself. The principle that legislative power can not be delegated is not involved. On determining the question submitted to it, the council is no more engaged in acts of legislation than would be the institutions themselves or the individual incorporators. "Can not the legislature," asks the New York court of appeals, "confer upon a commission the power, upon the application of individuals, to make the same determination for the individuals which they could make for themselves?" The court answered the question in the affirmative, and so, I believe, would the courts of the country generally.

May we not hope that, in the several States legislation may be obtained which shall protect the universities of the country from the evils which exist from the failure to exercise a supervision deemed essential by European States? We Americans need to rid ourselves of the notion that a "go-as-you-p'ease" policy is good enough for us. The time has come when institutions doing only preparatory work should not be permitted to confer university degrees, and when professional schools, established as money-making manufactories, should be deprived of the right to sell degrees.

In the discussion which followed the reading of President Rogers's paper, President James H. Baker, of the University of Colorado, said:

The State should exercise control over degree-conferring colleges, because (*a*) the country is developed beyond the period when crude expedients for higher education are necessary; (*b*) the majority of the States provide, at public expense, higher education of a good standard, making colleges of inferior grade unnecessary; (*c*) the State should guard the people against the deceptive claims of institutions not properly equipped to maintain work according to the accepted standards of the country; (*d*) for practical considerations, as well as reasons of sentiment, a degree should be such as to merit the respect of genuine scholars; (*e*) proper control would reduce the number of unnecessary colleges; (*f*) the kind of degrees should be subject to control, and the abuse of honorary degrees should be regulated; (*g*) in this matter the advantage of freedom and competition are more than offset by the disadvantages.[1]

The section on legal education of the American Bar Association, at a meeting held at Cleveland, Ohio, in August, 1897, unanimously adopted the following resolutions:[2]

Resolved, That the section on legal education recommends the American Bar Association to adopt the following resolution:

Resolved, That the American Bar Association disapproves the policy which now generally prevails in the several States and which makes it possible for persons to organize law schools and confer degrees without reference to the length of course of study or the qualifications required for admission and graduation of students, and that this association believes that the degree-conferring power should be subject to strict State supervision, to be exercised in a manner somewhat similar to that which is exercised by the regents of the University of [the State of] New York; and

Resolved further, That this association emphatically disapproves of the conferring by law schools of the Ph. D. degree or any other than the strictly law degree.

In April, 1896, the North Central Association of Colleges and Preparatory Schools appointed a committee, consisting of Presidents James B. Angell, of the

[1] Proceedings N. E. A., 1897, p. 708. [2] School Review, Vol. VI, pp. 350-351.

Digitized by Google

University of Michigan; Henry Wade Rogers, of Northwestern University; F. H. Snow, of the University of Kansas; R. H. Jesse, of the University of the State of Missouri; Joseph Swain, of Indiana University; George E. MacLean, of the University of Nebraska; A. S. Draper, of the University of Illinois; William F. Slocum, of Colorado College, and George A. Gates, of Iowa College, to consider the question of possible legislation regulating the granting of academic degrees. At the meeting of the association in April, 1898, the committee presented a report with recommendations. After detailing the resolutions adopted by the department of higher education of the National Educational Association and the section on legal education of the American Bar Association, and giving extracts from the paper of President Rogers read at the meeting of the National Educational Association in 1897, the report continues:[1]

The committee desires to condemn with the utmost severity a state of the laws which makes possible the existence of such an institution as the National University of Chicago, whose proceedings have been denounced in the British Parliament and in the press of the United States. In like manner the committee condemns a condition that makes it possible for a law school to confer the purely academic degree of Ph. D., or for an agricultural college to give the degree of D. D., things as utterly improper as it would be for a veterinary college to assume to confer the degree of bachelor of arts. The state of the law on this subject brings reproach upon our educational system and is highly discreditable. The value of our academic degrees is greatly impaired both at home and abroad by the total lack of any supervision by the State over our degree-conferring institutions, and which makes it possible for institutions doing preparatory work to confer the highest academic degrees. The time has come when this condition of affairs should be brought to an end and when an appeal should be made to our legislative bodies to reform the laws in a manner that will make impossible the longer continuance of the abuses which now exist.

The committee submitted the following recommendations:[2]

1. That in each State represented in the association an effort be made at the earliest opportunity to establish by law a body to be known as "The Educational Commission of ——" [inserting the name of the State].
2. That the commission be composed of not less than six members nor more than nine.
3. That the members of the commission be appointed by the governor and confirmed by the senate. That no person be eligible to appointment on the commission who is a member of the faculty, or board of trustees, or other governing body, of any educational institution within the State. And that membership in the commission be forfeited *ipso facto* if at any time subsequent to the appointment aforesaid the person so appointed becomes connected with any educational institution in the manner above mentioned.
4. That the members of the commission hold office for a period of not less than six years. And that the term of office be so arranged that not more than one-third shall retire in any one year.
5. That institutions hereafter incorporated shall derive the degree-conferring power from the commission and not otherwise. That institutions heretofore incorporated, and which now possess the degree-conferring power, may continue to exercise the same unless deprived of the right so to do by the commission on the ground that the institution affected falls below the standard which the commission has established.
6. That the commission shall not grant the degree-conferring power to any institution incorporated as a business enterprise, or to any one in which any part of the assets or income can be divided among stockholders, or to any institution having lower requirements for admission or graduation than the minimum standard therefor established by the commission, or to any institution hereafter established as a college or university unless its productive endowment shall amount to at least $100,000.
7. The commission shall not confer the degree-conferring power upon any institution until such institution has applied therefor in writing and accompanied the application with the sworn statement of the president and treasurer as to the amount of its productive endowment, the provision made for buildings, furniture, apparatus, and the requirements for admission and graduation.

[1] School Review, Vol. VI, p. 354. [2] School Review, Vol. VI, pp. 355–356.

Digitized by Google

8. The commission shall have the right, after having given reasonable notice, to withdraw the degree-conferring power from any institution upon which it has conferred it whenever an institution fails to meet the conditions necessary to justify the granting of the power in the first instance.

9. The commission may require any institution to which it has granted the degree conferring power to report under oath to it, at such times as it may designate, upon such matters as it deems necessary to enable it to exercise intelligently the powers reposed in it. And the failure of an institution to report within a reasonable time and in a satisfactory manner shall justify the commission in withdrawing from an institution so offending its degree-conferring power.

10. Any institution which exercises the degree-conferring power contrary to the provisions hereinbefore set forth shall forfeit its right to exist as an educational institution, and it shall be the duty of the law officers of the State to wind up its affairs. And the members of a board of trustees so offending shall be individually liable to fine or imprisonment, or both, according to the discretion of the court.

In an editorial on the report submitted to the North Central Association of Colleges and Preparatory Schools, the Educational Review for June, 1898, says:

The [proposed] law is an admirable one, and ought to be adopted by every State in the Union, in order that wild-cat education may go the way of wild-cat banking. It would be well, we think, to add a provision to the proposed law to the effect that no educational institution should be allowed to bear the name of a municipality or commonwealth unless supported by such municipality or commonwealth and under its control. Much uncertainty and ambiguity would be at once cleared up by such a provision. Private colleges would appear openly as such, and public names would be reserved for public institutions.

In the following pages are given the laws or extracts from laws concerning the incorporation of educational institutions, furnished by officials of the several States:

COLORADO.

Any church, congregation, or society formed for religious worship, educational or benevolent purposes may become incorporated by electing or appointing, according to its usages or customs, at any meeting held for that purpose, two or more of its members as directors or trustees, wardens or vestrymen (or such other officers whose powers and duties are similar to those of trustees as shall be agreeable to the usages and customs, rules and regulations of such congregation, church, or society), and may adopt a corporate name, and upon the filing of an affidavit by the chairman or secretary of the meeting setting forth the above facts, it shall be and remain a body politic and corporate by the name so adopted, said affidavit to be filed in the office of the recorder of deeds in the county in which such organization is formed, or in the office of the secretary of state.

Any corporation now or hereafter existing for educational purposes, under the laws of this State, which shall maintain one or more institutions of learning of the grade of a university or college shall have authority, by its directors or board of trustees, or by such person or persons as may be designated by its constitution or by-laws, to confer such degrees and grant such diplomas and other marks of distinction as are usually conferred and granted by other universities and colleges of like grade.

DISTRICT OF COLUMBIA.

Any five or more persons desirous of associating themselves for the purpose of establishing an institution of learning may make, sign, and acknowledge, before any officer authorized to take acknowledgment of deeds in the District, and file in the office of the recorder of deeds, a certificate in writing, to be recorded in a book kept for that purpose, and open to public inspection, in which shall be stated:

First. The name or title by which the institution shall be known in law.

Second. The number of trustees, directors, or managers, and their names.

Third. The particular branch of literature and science, or either of them, proposed to be taught; and

Fourth. If the institution is to be of the rank of a college or university, the number and designation of the professorships to be established.

Upon filing such certificate, the persons signing and acknowledging the same, and their successors and associates, shall be a body politic and corporate, by the

Digitized by Google

name and style stated in the certificate, and by that name and style shall have perpetual succession, with power to sue and be sued, plead and be impleaded, to acquire, hold, and convey property in all lawful ways, to have and use a common seal, and to alter and change the same at pleasure, to make and alter from time to time such by-laws, not inconsistent with the Constitution of the United States or the laws in force in the District, as they may deem necessary for the government of the institution, and to confer upon such persons as may be considered worthy such academical or honorary degrees as are usually conferred by similar institutions.

(Act May 5, 1870.)

GEORGIA.

A private corporation for any purpose whatever except banking, insurance, railroad, canal, navigation, express, and telegraph may be created in Georgia by complying with the following provisions of the code:

1. The persons desiring the charter shall file in the office of the clerk of the superior court of the county in which they desire to transact business a petition or declaration specifying the objects of their association and the particular business they propose to carry on, together with their corporate name, and the amount of capital to be employed by them actually paid in, and their place of doing business, and the time, not exceeding twenty years, for which they desire to be incorporated, which petition or declaration shall be published once a week for four weeks in the nearest public gazette to the point where such business is located before said court shall pass an order declaring said application granted. After the granting by the court of the order of incorporation, the petition and said order shall be recorded together by said clerk in a book to be kept for that purpose, and to be known as "The Record of Superior Court Charters," and which shall be kept appropriately indexed by said clerk; but this shall not dispense with the recording of the order of incorporation upon the minutes of the court, also, as a part of the proceedings of the court.

2. If, upon hearing such petition, the court shall be satisfied that the application is legitimately within the purview and intention of this code, it shall pass an order declaring the said application granted, and the petitioners and their successors incorporated for and during a term not exceeding twenty years, with the privilege of renewal at the expiration of that time according to the provisions above set forth. A certified copy of this petition and order, under the seal of the court, shall be evidence of such incorporation in any court in this State.

3. No corporation created under this article shall commence to exercise the privileges conferred by the charter until 10 per cent of the capital stock is paid in, and no charter shall have any force or effect for a longer period than two years, unless the corporators, within that time, shall in good faith commence to exercise the powers granted by the act of incorporation; and in case of the failure of said corporation, the stockholders shall be bound, in their private capacity, to any creditor of said corporation for the amount of stock subscribed for by him until the said subscription is fully paid up, or until the stockholder shall have paid, out of his private property, debts of the said corporation to an amount equal to his unpaid subscription.

4. The clerk of the court, for his services, shall receive the usual fees allowed for similar services in other cases.

5. Corporations thus created may exercise all corporate powers necessary to the purpose of their organization, but shall make no contract or purchase, or hold any property of any kind except such as is necessary in legitimately carrying into effect such purpose, or for securing debts due to the company.

ILLINOIS.

Societies, corporations, and associations (not for pecuniary profit) may be formed as hereinafter provided. Any three or more persons, citizens of the United States, who shall desire to associate themselves for any lawful purpose, other than for pecuniary profit, may make, sign, and acknowledge, before any officer authorized to take acknowledgments of deeds in this State, and file in the office of the secretary of state, a certificate in writing, in which shall be stated the name or title by which such corporation, society, or association shall be known in law, the particular business and objects for which it is formed, the number of its trustees, directors, or managers and the names of the trustees, directors, or managers selected for the first year of its existence.

Upon filing a certificate as aforesaid, the secretary of state shall thereupon issue a certificate of the organization of the corporation, society, or association, making

Digitized by Google

a part thereof a copy of all papers filed in his office in and about the organization thereof, and duly authenticated under his hand and seal of State; and the same shall be recorded in a book for that purpose, in the office of the recorder of deeds of the county in which the principal place of business of such corporation, society, or association is located. Upon complying with the foregoing conditions the corporation, society, or association shall be deemed fully organized and may proceed to business: *Provided*, The secretary of state shall not issue a certificate of organization to any corporation, society, or association under the name of any then existing. (Act April 18, 1872.)

Trustees, directors or managers of educational institutions may prescribe the courses of study and grant such literary honors and degrees as are usually granted by like institutions, and give suitable diplomas. (Act March 24, 1874.)

AN ACT in relation to the incorporation of educational institutions.

SECTION 1. *Be it enacted by the people of the State of Illinois, represented in the general assembly*, That whenever property, real or personal, has heretofore been or shall hereafter be devised or bequeathed by last will and testament, or granted, conveyed, or donated by deed or other instrument, to trustees, to be applied by them to the foundation and establishment in any of the cities, villages, and towns of this State of any educational institution, it shall be lawful for the acting trustees in any such case, in order to promote the better establishment, maintenance, and management of such institution, to cause to be formed a corporation under the provisions of this act, with the rights, powers, and privileges hereinafter provided for.

§ 2. Such acting trustees may make, sign, and acknowledge before any officer authorized to take acknowledgments of deeds in this State, and file in the office of the secretary of state a statement in writing in which shall be set forth the intent of such trustees to form a corporation under this act; a copy of the will or other instrument by which endowment of said educational institution has been provided; the name adopted by the proposed corporation (which shall not be the name of any other corporation existing); the city, village, or town in which the educational institution and the principal place of business of the corporation will be located; the number of managers who may be denominated trustees, managers, or directors of the corporation, and the names of the trustees, managers, or directors who are to constitute the original board of such officers and who shall hold until their successors, respectively, are elected and qualified as in this act provided.

§ 3. Upon the filing in his office of such a statement as aforesaid the secretary of state shall issue to the incorporators, under his hand and seal of State, a certificate, of which the aforesaid statement shall be a part, declaring that the organization of the corporation is perfected. The incorporators shall thereupon cause such certificate to be recorded in a proper record book for the purpose in the office of the recorder of deeds of the county in which the said educational institution is to be located, and thereupon the corporation shall be deemed fully organized, and may proceed to carry out its corporate purposes, and may receive by conveyance from the trustees under said will, deed, or other instrument of donation the property provided by will or otherwise as aforesaid for the endowment of said educational institution, and may hold the same in whatever form it may have been received or conveyed by said trustees until such form shall be changed by the action of said corporation.

§ 4. Organizations formed under this act shall be bodies corporate and politic, to be known under the names stated in the respective certificates or articles of incorporation, and by such corporate names they shall have and possess the ordinary rights and incidents of corporations, and shall be capable of taking, holding, and disposing of real and personal estate for all purposes of their organization. The provisions of any will, deed, or other instrument by which endowment is given to said educational institution and accepted by said trustees, managers, or directors shall, as to such endowment, be a part of the organic and fundamental law of such corporation. The trustees, managers, or directors of any such corporation shall compose its members, and shall not be less than three nor more than seven in number, which number may be changed within said limits from time to time by the trustees, managers, or directors of any such corporation, in such manner as may be provided in their by-laws; *Provided, however*, That the number of trustees, managers, or directors shall never be less than the number of trustees provided by the will creating any such trust for the administration thereof; shall elect the officers of the corporation from their number, and shall have control and management of its affairs and property; may accept donations and in their discretion hold the same in the form in which [they] are given, for all purposes of education, science, literature, and art, germane to the object and purpose of said corporation. They may fill by election, subject to the approval

Digitized by Google

of the chief justice, for the time being, of the supreme court of Illinois, vacancies occurring in their own number by death, incapacity, retirement, or otherwise, and may make lawful by-laws for the management of the corporation and of the educational institution, which by-laws shall set forth what officers there shall be of the corporation, and shall define and prescribe their respective duties. They may appoint and employ, from time to time, such agents and employees as they may deem necessary for the efficient administration and conduct of the educational institution and other affairs of the corporation. Whenever any trustee, manager, or director shall be elected to fill any vacancy a certificate under the seal of the corporation, giving the name of the person elected, shall be recorded in the office of the recorder of deeds where the articles of incorporation are recorded. The trustees, managers, or directors of such corporation shall, in the month of January in each year, cause to be made a report to the governor of the State for the year ending on the thirty-first day of December preceding, of the condition of the educational institution and of the funds and other property of the corporation, showing the assets and investments of such corporation in detail.

Approved, June 21, 1895.

KENTUCKY.

AN ACT to provide for the organization of Eleemosynary and Educational Institutions.

Be it enacted by the general assembly of the Commonwealth of Kentucky: § 1. Any number of persons may associate to form a corporation, society, or association, having no capital stock, for religious, charitable, educational, or any other lawful purpose, from which no private pecuniary profit is to be derived. Such persons shall sign articles of incorporation, and the same shall be filed in the office of the secretary of state and recorded in the county clerk's office of the county where the principal place of business of the incorporation is located. The articles shall set forth the name of the proposed corporation, society, or association, which shall not be the name of any existing corporation, and the object for which it is formed, and such other facts as the signers of the articles deem proper to mention.

§ 2. When the articles are filed and recorded as provided, and a certificate of that fact is issued by the secretary of state, the signers of the articles, their associates and successors, shall be a body corporate and politic, and by the name selected shall have the right to sue and be sued, contract and be contracted with, have and use a common seal, and alter the same at pleasure; and to receive and hold such property, real and personal, whether obtained by purchase, gift, or devise, as may be necessary to carry on or promote the objects of the corporation, society, or association, and may sell or dispose of such property at pleasure, unless the property has been received as a gift or devise for some special purpose, and if so received it shall be used and applied only for such purpose.

§ 3. Corporations, associations, or societies organized under this act may adopt such rules for their government and operation, not inconsistent with law, as the directors, trustees, or managers deem proper, but shall not be operated, managed, or used for private gain, or engage in any plan or scheme of banking or insurance.

§ 4. Existing corporations, associations, or societies heretofore incorporated or chartered, and not operated, managed, or used for private profit, and such as may become organized under this act, may, by the consent of two-thirds of the directors, managers, or trustees, amend any part of the charter or articles of incorporation by filing and recording the amendment in the manner herein provided for filing and recording original articles.

§ 5. Corporations, associations, or societies organized under this act shall not be subject to any of the laws relating to corporations having a capital stock, or organized for pecuniary profit, except that requiring an agent on whom process may be executed, but shall at all times be subject to visitation by the legislature.

§ 6. In view of the fact that one or more of the existing institutions affected by this act desire to reorganize at once under its provisions, therefore an emergency exists, and this act shall take effect from its passage.

Approved, March 22, 1892.

NEBRASKA.

EDUCATIONAL CORPORATIONS.

How incorporated.—Any number of persons, not less than five, desiring to establish a college, university, normal school, or other institution for the purpose of promoting education, religion, morality, agriculture, or the fine arts may, by complying with the provisions of this subdivision, become a body corporate and politic with perpetual succession, and may assume a corporate name by which they may sue and be sued, plead and be impleaded in all courts of law and equity;

Digitized by Google

may have a corporate seal, and the same alter and break at pleasure; may hold all kinds of estate, real, personal, or mixed, which they may acquire by purchase, donation, devise, or otherwise, necessary to accomplish the objects of the corporation, and the same to dispose of and convey at pleasure.

Value of property.—To ascertain the property and value thereof, of any institution desirous of becoming a body corporate, under the provisions of this subdivision, it shall be the duty of the probate judge of any county of this State, on application in writing, of any number of persons not less than five, of whom not less than five shall be resident freeholders of the county where such application is made, or where such institution is or is intended to be located, setting forth the objects for which they desire to become incorporated, to select three disinterested freeholders of the county and voters therein, as appraisers, who shall first take an oath for the faithful discharge of their duties, before some competent officer, and such appraisers shall then proceed to make a schedule, and upon actual view to appraise the true value, in money, of all such goods, chattels, lands, and tenements, choses in action, rights, credits, and subscriptions as such applicants shall exhibit to such appraisers, and shall return such schedule with their appraisement and certificate of some officer authorized to administer oaths that such appraisers were first duly sworn by him to discharge their duties as such appraisers, to the probate judge of the proper county; and if the amount so found shall be equal to the sum required for the commencement of any such institution as said applicants desire, such probate judge shall give such applicants a certificate of the fact, and they shall enter it in a book of records, by them provided for that purpose, which certificate, together with the corporate name and the articles of association, they shall also cause to be recorded in the county clerk's office of the county where such institution is or is intended to be located, and they shall thenceforward be a body corporate and politic, according to the provisions of this subdivision; and such probate judge, appraisers, and county clerk shall be entitled to the same fees as for like services in other cases and no more.

Trustees.—The corporators of any college or university which may be organized in accordance with the provisions of this subdivision may elect five or more trustees, of whom not less than five shall be resident freeholders of the county where such college or university is located, who shall constitute a board of directors for such institution, and they shall have power to fill vacancies that may occur in their board, and shall hold their offices until their successors are elected and qualified according to the rules and by-laws that may be adopted by the board of trustees, but at all times at least five of such board of trustees shall be residents, freeholders of the county where such institution is located; and when any such board, in their corporate name, shall have acquired for the benefit of such institution five thousand dollars in real and personal property, to be ascertained as herein provided, said trustees shall have power to appoint a president, professors, tutors, and teachers, and any other necessary agents and officers, and fix the compensation of each, and may enact such by-laws not inconsistent with the laws of this State or the United States, for the government of the institution, and for conducting the affairs of the corporation, as they may deem necessary, and shall have power to confer, on the recommendation of the faculty, all such degrees and honors as are conferred by colleges and universities of the United States, and such others, having reference to the course of study and the accomplishment of the student, as they may deem proper.

UNIVERSITIES.

How incorporated.—Whenever any person or persons shall have become possessed of funds, securities, and property of the value of one hundred thousand dollars or more for the purpose of an institution of learning of the rank and grade of a college or university, it shall be competent for him or them to present to the judge of the district court of the county in which such institution is, or is proposed to be situated, a petition setting forth the fact, and such circumstances as may be pertinent, praying the appointment of one or more commissioners to examine into the truth thereof; and thereupon it shall be the duty of the said judge to appoint a commissioner or commissioners for the purpose aforesaid. The person or persons so appointed shall be, by said judge, sworn to full inquiry and true report make of the matters given to him or them in charge, and the said oath, duly subscribed by the parties and certified by the said judge, shall be filed in the office of the clerk of said county. The said commissioner or commissioners shall thereupon personally examine the property, funds, and securities alleged to be set apart for the purpose aforesaid, and shall appraise the same and report the facts thus ascertained to the said judge. If, from the said report, it shall appear to the said judge that the sum of one hundred thousand dollars in property, funds,

Digitized by Google

and securities of that value have been set apart for the purpose aforesaid, so as to be irrevocably and inviolably appropriate thereto, the said judge shall indorse the said report with an order approving the same, and directing that the same be filed in the office of the said county clerk, together with the petition aforesaid, and other papers presented to him in the same matter, which petition, report, order, and papers shall be recorded by the said clerk in the book of incorporations to be kept in his office.

Trustees.—Whereupon, the person or persons possessed of the said funds, securities, and properties may, under his or their hands, appoint five or more persons to be trustees of the said institution, who shall thereupon become a body politic and corporate under a name and style to be named, designated, and appointed for the purpose by the aforesaid person or persons in the said writing appointing the said trustees, which paper, writing of appointment, shall be filed and recorded in the book of incorporations in the office of the said county clerk, and the said trustees, under the name and style so named, designated, and appointed, may sue and be sued, plead and be impleaded, in all courts of law and equity, have a common seal, and the same alter, break, and renew at pleasure, and hold all kinds of estate, real and personal and mixed, which they may acquire by purchase, donation, devise, or otherwise, necessary to accomplish the purpose of the corporation, and the same to dispose of and convey at pleasure. And a certified copy of the said paper, writing, appointing said trustees, and naming, designating, and appointing the name and style of such corporation, shall be *prima facie* evidence in all courts and before all officers, boards, commissioners, and tribunals of the due incorporation of such body politic and corporate.

Powers of trustees.—The said board of trustees shall have power to fill all vacancies in their number, to make rules, regulations, and by-laws for the government of their board and of the institution; to appoint a president, professors, tutors, and teachers, and any other necessary officers and agents, and fix the compensation of each; to erect within and as departments of said institution such schools and colleges of the arts and sciences and professions as to them may seem proper, and to confer such academic degrees and honors as are conferred by colleges and universities of the United States, and to borrow from time to time, for the purpose of paying indebtedness, such sum or sums of money as they may see fit, and to secure such loan or loans by mortgage or trust deed executed by their president and secretary, upon their college or university buildings and grounds, and otherwise as they shall deem expedient; *Provided*, That if such institution has stockholders, the said board of trustees shall first be authorized to borrow such money and execute said mortgage or trust deeds by vote of the owners of a majority of the stock.

Foreign corporations—Diplomas, etc.—That any corporation organized under the laws of any other State or States, Territory or Territories, for the purpose of establishing, maintaining, and conducting institutions of learning of the rank or grade of a college or university, which has complied with or hereafter may comply with the provisions of section 215 of chapter 16 of the compiled statutes of the State of Nebraska, and of this act, be, and the same are hereby, permitted, authorized, and empowered to issue diplomas and to confer degrees and honors such as are conferred by colleges and universities of the United States.

Same—Status ascertained—Procedure.—Whenever any such corporation shall have become possessed of property and funds of the value of one hundred thousand dollars or more, whether in land, buildings, funds, securities, or endowments, and shall have established an institution for the purposes aforesaid within this State, it shall be competent for such corporation to present to the judge of the district court of the county in which the said institution shall be located, a petition setting forth the facts and stating that the said corporation has complied with the provisions of the section aforesaid and of this act, together with such other facts as may be pertinent, and praying the appointment of three commissioners to examine into the truth thereof. And thereupon it shall be the duty of the said judge to appoint three disinterested commissioners, residents of the said county, for the purposes aforesaid. The persons so appointed shall be, by the said judge, sworn to true inquiry, and full report make of the matters given them in charge, which said oath shall be subscribed by the parties and certified by the said judge, and shall be filed in the office of the clerk of said county, as hereinafter provided. The said commissioners shall thereupon immediately proceed to the discharge of their said duties, and shall personally examine the property, funds, securities, and endowments of the said institution alleged to be set apart for the purposes aforesaid, and shall appraise the same and shall report facts thus ascertained in writing, duly signed by the said commissioners, to the said judge. If to the said judge it shall appear from the said report that the said corporation has complied with the provisions of this act, and that the said sum of one hundred thousand dollars or more, in property,

Digitized by Google

funds, securities, or endowments, has been set apart for the purposes aforesaid, to be irrevocably and inviolably appropriate thereto, the said judge shall indorse said report with an order approving the same, and shall in said order fix the compensation of the said commissioners, and shall direct that the said order, together with the petition and oaths and all other papers pertaining to the said matter, be filed in the office of the clerk of said county, and the said petition, oaths, report, order, and other papers shall be recorded by the said clerk in the book of incorporation provided by law to be kept in his office.

Same—Powers, diplomas, etc.—That thereupon the said corporation may, by its regents, trustees, or other government officer or officers thereof, upon the recommendation of the faculty of said institution, issue diplomas and confer degrees and honors, as provided in section 1 of this act.

NEW YORK.

Educational institutions are chartered by the regents of the University of the State of New York.

Regents.—The university is governed and all its corporate powers exercised by 19 elective regents, and by the governor, lieutenant-governor, secretary of state, and superintendent of public instruction, who are ex officio regents. The regents may confer by diploma under their seal such honorary degrees as they may deem proper, and may establish examinations as to attainments in learning, and may award and confer suitable certificates, diplomas, and degrees on persons who satisfactorily meet the requirements prescribed.

Charters.—The regents may, by an instrument under their seal and recorded in their office, incorporate any university, college, academy, library, museum, or other institution or association for the promotion of science, literature, art, history, or other department of knowledge, under such name, with such number of trustees or other managers, and with such powers, privileges, and duties, and subject to such limitations and restrictions in all respects as the regents may prescribe in conformity to law.

Conditions of incorporation.—No institution shall be given power to confer degrees unless it shall have resources of at least $500,000, and no institution for higher education shall be incorporated without suitable provision, approved by the regents, for buildings, furniture, educational equipment, and proper maintenance. No institution shall institute or have any faculty or department of higher education in any place or be given power to confer any degree not specifically authorized by its charter; and no institution of higher education shall be incorporated under the provisions of any general act authorizing the formation of a corporation without grant of a special charter on individual application, and no corporation shall, under authority of any general act, extend its business to include establishing or carrying on any such institution.

Change of name or charter.—The regents may at any time, for sufficient cause, by an instrument under their seal and recorded in their office, change the name, or alter, suspend, or revoke the charter or incorporation of any institution which they might incorporate, if subject to their visitation or chartered or incorporated by the regents or under a general law; provided, that unless on unanimous request of the trustees of the institution, no name shall be changed and no charter shall be altered, nor shall any rights or privileges thereunder be suspended or repealed by the regents, till they have mailed to the usual address of every trustee of the institution concerned at least thirty days' notice of a hearing when any objections to the proposed change will be considered, and till ordered by vote at a meeting of the regents for which the notices have specified that action is to be taken on the proposed change.

Among the ordinances adopted by the regents are the following:

College defined.—An institution to be ranked as a college must have at least six professors giving their entire time to college and university work, a course of four full years of college grade in liberal arts and sciences, and must require for admission not less than the usual four years of academic or high-school preparation or its equivalent, in addition to the preacademic or grammar-school studies.

Degree-conferring power.—No charter hereafter granted shall authorize any institution to confer any honorary degree or any degree on examination without residence, or any degree on lower requirements than those fixed by the university ordinances as the minimum for that degree.

Honorary degrees.—The bachelor's degrees in arts, philosophy, science, and literature, and the doctor's degree in philosophy shall not be conferred by the university or by any institution in this State causa honoris.

Digitized by Google

Nonresident degrees.—No degree shall be conferred in this State on examination without completion of a prescribed course, of which at least one year has been taken in regular attendance on the usual exercises of a teaching institution registered for that degree.

PENNSYLVANIA.

AN ACT to provide for the incorporation of institutions of learning with power to confer degrees in art, pure and applied science, philosophy, literature, medicine, law, and theology, and for the supervision and regulation of the same, and providing a method by which institutions already incorporated may obtain the power to confer degrees, and exempting from the provisions of this act colleges heretofore incorporated by the courts of common pleas with power to confer degrees in cases where such colleges have at the time of the passage of this act a specified amount of capital or resources.

SECTION 1. *Be it enacted, &c.*, That all institutions of learning hereafter to be incorporated as colleges, universities, or theological seminaries with power to confer degrees in art, pure and applied science, philosophy, literature, law, medicine, and theology, or any of them, shall be incorporated in the manner hereinafter set forth, with general power as follows:

First. To have succession by their corporate names for the period limited by their charters, and when no period is limited thereby, or by this act, perpetually, subject to the power of the general assembly, under the constitution of this Commonwealth.

Second. To maintain and defend judicial proceedings.

Third. To make and use a common seal and alter the same at pleasure.

Fourth. To hold, purchase, and transfer such real and personal property as the purposes of the corporation require, not exceeding the amount limited by its charter or by law.

Fifth. To appoint and remove such subordinate officers and agents as the business of the corporation requires, and to allow them suitable compensation.

Sixth. To make by-laws, not inconsistent with law, for the management of their property and the regulation of its affairs.

Seventh. To enter into any obligation necessary to the transaction of their ordinary affairs.

Section 2. Whenever five or more persons, three of whom at least are citizens of this Commonwealth, shall voluntarily associate themselves together for the purpose of obtaining a charter of incorporation as a college, university, or theological seminary with power to confer degrees as aforesaid, they shall prepare a certificate of such intended incorporation, which shall set forth:

I. The name of the corporation.

II. The purpose for which it is formed.

III. The place or places where its business is to be transacted.

IV. The term for which it is to exist.

V. The names and residences of the subscribers.

VI. The number of its directors, trustees, or managers, and the places of residence of those who are chosen as such for the first year.

VII. The amount of assets in the possession of said subscribers which are to be devoted to the purpose of establishing and conducting said college or university.

VIII. The minimum number of persons whom it is intended to regularly employ as members of the faculty of said corporation.

IX. A brief statement of the requirements for admission and of the course of study to be pursued in said institution.

Section 3. Notice of the intention to apply for any such charter shall be inserted in two newspapers of general circulation, printed in the proper county, for three weeks, setting forth briefly the character and object of the corporation to be formed and the intention to make application therefor.

Section 4. The said certificate of incorporation shall be acknowledged by at least three of said subscribers, and before the recorder of deeds, et cetera, of the county in which the business of the corporation is to be transacted, to be their act and deed and for the purposes therein contained, and the same having been duly certified under the hand and official seal of said recorder of deeds, et cetera, shall be presented to any law judge of a court of common pleas of said county, accompanied by the proof of publication of the notice of such application, who is hereby required to peruse and examine said instruments, and, if the same be found to be in proper form and within the purposes of this act and shall appear lawful and not injurious to the community, he shall endorse thereon these facts and shall thereupon direct the prothonotary or clerk of said court to transmit to the superintendent of public instruction of the Commonwealth a certified copy of said certificate of incorporation, together with the said endorsements thereon.

Digitized by Google

Section 5. No charter for such incorporation, with power to confer degrees as aforesaid, shall be granted until the merits of the application, from an educational standpoint, shall be passed upon by a board to be styled the "College and University Council," which shall consist of twelve members, namely, the governor, the attorney-general, and the superintendent of public instruction, who shall be members ex officio, three persons selected from the presiding officers of undenominational colleges or universities of this Commonwealth, three persons selected from the presiding officers of denominational colleges or universities of this Commonwealth, and three persons holding official relationship to common schools of the State. Those who are not ex officio members shall be appointed by the governor, with the advice and consent of the senate, for a term of four years.

Section 6. No institution shall be chartered with the power to confer degrees, unless it has assets amounting to five hundred thousand dollars invested in buildings, apparatus, and endowments for the exclusive purpose of promoting instruction, and unless the faculty consists of at least six regular professors who devote all their time to the instruction of its college or university classes, nor shall any baccalaureate degree in art, science, philosophy or literature be conferred upon any student who has not completed a college or university course covering four years. The standard of admission to these four year courses or to advanced classes in these courses shall be subject to the approval of the said council.

Section 7. Upon receipt of said certified copy of certificate of incorporation as directed in section four of this act, the said superintendent of public instruction shall, within sixty days thereafter, cause said "college and university council" to be convened at such time and place as he may designate, and said council shall thereupon hear and consider said application, and if the course of instruction and standard of admission to said institution and the composition of the faculty shall appear to said council to be sufficient, and the educational needs of the particular locality in which the proposed institution is to be situated and of the Commonwealth at large are likely to be met by the granting of said application, the said council shall thereupon cause to be endorsed on said application or certificate its findings and its approval of the same, together with a recommendation to the law judge or court before whom the same was originally presented that the same be granted. If, in the judgment of the council, the said application should not be granted, it shall endorse thereon its findings, and its disapproval of the same with a recommendation that said application be refused. The said certified copy of said certificate shall, with the endorsements thereon, thereupon be returned to the said law judge or court, who, in finally passing upon the application, shall be guided in his decree by the finding of the college and university council. In case the law judge, after giving his consideration to the findings of the said council, shall be satisfied with the propriety of the application in view of all the facts, he shall approve the same and order and decree that, upon the recording of said certificate with the recommendation of said council and a copy of said order of court in the recorder's office aforesaid, the subscribers thereto and their associates and successors shall be a corporation for the purpose and upon the terms therein stated, and thenceforth the persons named therein and subscribing the same, and their associates and successors shall be a corporation by the name therein given. In case of the disapproval of said application by the council aforesaid, the proposed charter shall not be granted.

Section 8. In the transaction of business of said "college and university council" the concurrence of a majority of the members thereof shall be required.

Section 9. All institutions chartered under this act shall be subject to visitation and inspection by representatives of the council, and if any one of them shall fail to keep up the required standard the court shall, upon the recommendation of the council, revoke the power to confer degrees.

Section 10. The council shall meet regularly on the first Tuesday of October preceding the biennial session of the legislature, and shall submit to that body a biennial report upon higher education in Pennsylvania; said report to be printed in connection with the report of the superintendent of public instruction.

Section 11. Any college, university or theological seminary, heretofore incorporated under the laws of this Commonwealth, may apply to any law judge of any court of common pleas of the county in which the business of such corporation is transacted for amendments to its charter, enabling it to confer degrees in like manner as institutions originally incorporated under this act, and in the application therefor it shall follow the requirements of this act in respect of applications for original charters of incorporation and the method of procedure prescribed therefor. Such applications for amendments shall be acted upon by the same authorities and in the same manner as provided in this act for the original incorporation of colleges, universities, and theological seminaries. No such amendment

Digitized by Google

shall be granted, however, unless the institution applying therefor shall bring itself within the provisions of this act as fully as is required in the granting of original charters under this act.

Section 12. When a college or theological seminary has heretofore been incorporated by special act of assembly, it may obtain the power to confer degrees from the courts, as above set forth, provided it has invested funds amounting to one hundred thousand dollars at the time of the passage of this act. This act furthermore shall not impair the authority of colleges heretofore incorporated by such courts of common pleas with power to confer degrees in cases where such institutions have property or capital, at the time of the passage of this act, of at least one hundred thousand dollars, and which shall, within three months after the passage of this act, file with the superintendent of public instruction of this Commonwealth a sworn statement that the assets held by them individually for the purpose of promoting education in the higher branches of human learning amount to the sum of one hundred thousand dollars, nor shall this act impair the authority of universities similarly incorporated by the courts with the power to confer degrees in cases where such institutions possess property at the time of the passage of this act amounting to the sum of five hundred thousand dollars, and which shall, within three months from the passage of this act, file with the superintendent of public instruction of this Commonwealth a sworn statement that the assets held by them individually for the purpose of promoting instruction in the higher branches of human learning amount to the sum of five hundred thousand dollars; none of the provisions of this act, however, shall be construed as applying to institutions possessing capital stock and established for the purposes of private profit or gain.

Approved—The 26th day of June, A. D. 1895.

TEXAS.

Private corporations may be created by the voluntary association of three or more persons for the support of any benevolent, charitable, educational, or missionary undertaking.

The charter of an intended corporation must be subscribed by three or more persons, two of whom at least must be citizens of the State, and must be acknowledged by them before an officer duly authorized to take acknowledgment of deeds. Married women may be subscribers to charters.

Such charter shall be filed in the office of the secretary of state, who shall record the same at length in a book to be kept for that purpose, and retain the original on file in his office. A copy of the charter, or of the record thereof certified under the great seal of the State, shall be evidence of the creation of the corporation.

The existence of the corporation shall date from the filing of the charter in the office of the secretary of state, and the certificate of the secretary of state shall be evidence of such filing.

The president, professors, or principals shall constitute the faculty in academy, college, or university corporations, and shall have power to enforce the rules and regulations enacted by the directors or trustees for the government and discipline of the students, and to suspend and expel offenders, as may be deemed necessary.

The directors or trustees named in the charter, as required by this title, of any college, academy, university, or other corporation to promote education, and their successors, may make all necessary by-laws, elect and employ officers, provide for filling vacancies, appoint and remove professors, teachers, agents, etc., and fix their compensation, confer degrees, and do and perform any and all necessary acts to carry into effect the objects of the corporation.

Such corporations may procure, to be used as a part of the course of education, shops, tools, and machinery, land for agricultural purposes, and necessary buildings for carrying on their mechanical and agricultural operations.

Any such corporation may convert its property, except when held upon some special trust, into stock or scholarships, and file a certificate of their action, as required in the case of an increase of capital stock of a corporation. Such conversion can only take place by the consent of a majority of the stockholders.

The directors of any such corporation, whose property is held not as stock but upon trust or by devise, donation, gift, or subscription, shall not contract debts beyond the means of the corporation. If they do contract debts to a larger amount, they shall be held individually liable for the same after the means of the corporation are exhausted.

Any such corporation may, by a vote of three-fourths of the directors, or if the same is owned in shares of stock, then by a vote of three-fourths of the stock-

Digitized by Google

holders change the location and name of the institution and transfer the effects thereof to where removed, or may apply the property thereof to other purposes of education than those named in the original charter filed with the secretary of state.

WEST VIRGINIA.

Joint stock companies may be incorporated for universities, colleges, academies, seminaries, schools, or institutes, for the purpose of teaching any branch or branches of useful information or learning or promoting religion, morality, military science, or discipline.

The charter is granted by the secretary of state on the presentation to him of an agreement signed by not less than five persons, stating the name of the corporation, its purpose, location, duration, and certain information concerning the stock. The agreement must be acknowledged before a justice, notary, or judge, and must show that a certain portion of the capital stock has been paid in good faith.

WISCONSIN.

Three or more adult persons, residents of the State, may form a corporation for the establishment, maintenance, and use of schools, high schools, academies, seminaries, colleges, and universities, or for the cultivation and practice of music.

Any such corporation may be formed, to have a capital stock divisible into shares or without any capital stock, upon such plan as may be agreed upon.

In order to form such a corporation, the persons desiring to do so shall make, sign, and acknowledge written articles, containing:

1. A declaration that they associate for the purpose of forming a corporation under the revised statutes, and of the business or purposes thereof.
2. The name and location of such corporation.
3. The capital stock if any, the number of shares, and the amount of each share.
4. The designation of general officers and of the number of directors, which shall not be less than three.
5. The principal duties of the several general officers respectively.
6. The method and conditions upon which members shall be accepted, discharged, or expelled.
7. Such other provisions or articles as they may deem proper to be therein inserted for the interest of such corporation or the accomplishment of the purposes thereof.

Such original articles, or a true copy thereof verified as such by the affidavits of two of the signers thereof, shall be recorded by the register of deeds of the county in which such corporation is located, and no corporation shall, until such articles be so left for record, have legal existence. A like verified copy shall, within thirty days, be filed with the secretary of state, and for a failure so to do each signer of any such articles shall forfeit $25. The certificate of corporation is issued by the secretary of state.

Any corporation formed for the establishment and maintenance of schools, high schools, academies, seminaries, colleges, or universities, or for the cultivation and practice of music, shall have power to prescribe and regulate the courses of instruction therein, and to confer such degrees and grant such diplomas as are usually conferred by similar institutions, or as shall be appropriate to the courses of instruction prescribed.

CHAPTER XXIX.

REPORT ON SCHOOL STATISTICS,[1] MADE BY A COMMITTEE OF THE DEPARTMENT OF SUPERINTENDENCE OF THE NATIONAL EDUCATIONAL ASSOCIATION.

To the Department of Superintendence:

GENTLEMEN: Your committee, consisting of the undersigned and Messrs. James MacAlister and George P. Brown, holding over from the last year, conclude their report[2] on statistics by offering, first, a list of the items which, in their opinion, should be collected to show the workings of a school system.

They have arranged these items in three classes. The first class includes the essential data which should be taken every year, and from all schools. This first list contains the essential and indispensable items for every annual report.

[1] From Report of Proceedings of the meeting of the Department of Superintendence held in Brooklyn, N. Y., February, 1892. The appendices have been revised and somewhat enlarged.

[2] PRELIMINARY REPORT MADE IN FEBRUARY, 1891.

GENTLEMEN: Your committee appointed at the last annual meeting for the purpose of considering and reporting on the subject of School Statistics, beg leave to offer the following preliminary report, setting forth the results of their studies on the subject, and postponing for another meeting, or for the work of another committee, if it be your pleasure, the completion of the details of a scheme of statistics which will afford the data required for a comparative study of domestic and foreign educational systems.

Your committee would first call attention to the object and purpose of collection of statistics, which they conceive to be the following:

Statistics reveal the nature and efficiency of the powers and forces involved in a process. Forces and powers are revealed in their results. Their results are of little moment, if dead results, except as they indicate what the living power has been and still is. In matters of education we inquire into the aims and purposes of the educative process, and learn this by a quantitative study of the means employed and the results obtained. It is evident, therefore, at the outset, that the quantities given by our statistical tables can have no significance except in connection with the qualitative elements involved. We pass over at once from the how many to the what kind. We seek, again, new quantitative data that may indicate the quality, but we never reach quantitative data that are significant in and for themselves.

Your committee would suggest as the four principal heads under which school statistics may be grouped:

First. Attendance of pupils.
Second. Course of study.
Third. Teaching forces and appliances.
Fourth. Support—revenue and expenditures.

Under these four heads they would group the following details:

I.

Statistics of attendance should answer questions like the following—

(*a*) How many?
(*b*) How long?
(*c*) Who?

That is to say: (1) How many pupils in the aggregate? (2) How many relatively to the entire population? (3) How many relatively to the population of the school age, say 5 to 21, 6 to 14, or some other period agreed upon? Then this item should be further defined in five items: (1) How many enrolled during the annual session of school? (2) How many as average

Digitized by Google

The second list contains the more important of what we may call occasional statistics, and should not be expected every year, perhaps, nor from all schools. A

belonging? (3) How many in actual average daily attendance? (4) How many were dropped and afterwards readmitted? (5) The number of cases of tardiness.

Under the second item of attendance (*How long?*) we wish the number of daily school sessions for the year, and the hours of a school session, the length and hour of recesses and intermissions.

Under the third item of *Who?* we include such items as –

(1) How many of each sex?
(2) How many at each year of age, and the average age?
(3) Race.
(4) How many born in the town or State where the school is situated?
(5) How many born in other parts of the same nation?
(6) How many born abroad?
(7) Occupations of parents.

II.

Under the second of our four chief heads we should ask for statistics regarding the course of study, and thus determine by this grade of schools as follows:

(*a*) Kindergarten.
(*b*) Primary and grammar school.
(*c*) Secondary education.
(*d*) Higher education.

We should ask very carefully as to the relations of these items to the first class of items, especially age, sex, and average attendance.

The primary and grammar schools are to be distinguished from the secondary schools by the following tests: The introduction of algebra, or of an ancient or modern language, marks the beginning of the secondary course of study. The higher course of study should be marked by analytic mathematics, or by logical and philosophical studies, or by advanced language studies.

III.

The third general head, "The teaching forces and appliances," includes -

(1) Buildings and accommodations.
(2) Size of schools under one principal teacher (or else number of pupils per teacher).
(3) Number of teachers.
(4) Supervision.
(5) Means of training teachers.
(6) Examinations of teachers.
(7) Methods of discipline and instruction used by teachers.

IV.

The fourth general head, "The support of schools," includes—

(1) REVENUE. Items of.
  (*a*) Receipts from State and local taxation.
  (*b*) Receipts from funds or productive property.
  (*c*) Receipts, if any, from tuition.
(2) EXPENDITURES.
  (*a*) For teachers' salaries, including supervision.
  (*b*) Incidentals, including janitor hire, fuel, apparatus, and other current expenses.
  (*c*) Permanent investments, including building and repairs.

Your committee would call attention to the importance of a detailed discussion of the use to be made of these several items, in studying the effective forces of educational systems, and in comparing one with another. Such discussion is not here attempted, but is suggested as a proper subject of a supplementary report. Moreover, your committee have observed the prime necessity for such a definition of the several items as to prevent misunderstanding. A description of the best methods of keeping and tabulating the several items would also be a very useful addition to such a report.

In dealing with reports, not merely reports from a foreign country, but with reports from different sections of the United States, your committee has been impressed with the necessity of a glossary of terms used in tabulating statistics. There should be a careful collation of all terms and designations used here and abroad, and so minute a description given of the processes of ascertaining the data under the several heads, as to leave no doubt in the mind as to the exact meaning of each. Without this accurate information there can be no satisfactory comparative study of school systems.

All of which is respectfully submitted.

W. T. HARRIS.
JAS. MACALISTER.
GEORGE P. BROWN.

Digitized by Google

State superintendent may, for example, collect statistics one year regarding the place of nativity of pupils and parents, another year he may take occupations, and another year he may collect items regarding the preparation of the teaching force.

In our third list we have included still less essential items, which may be collected at still rarer intervals.

In the next place, we have given a tabular summary showing in detail the items actually collected in the several States of the Union, and side by side with it an exhibit of the statistical items collected in the several countries of Europe. As these details can not be read before an audience, your committee submit the same for printing in an appendix, hoping that they will be found useful to State officers in the preparation of their forms and blanks for collecting these returns.

All of which is respectfully submitted.

W. T. HARRIS,
Chairman of Committee.

APPENDIX I.

SCHOOL STATISTICS.

I. FUNDAMENTAL ITEMS.

1. Number of children of legal school age, classified by race and sex (school population).
   a, White males.
   b, White females.
   c, Colored males.
   d, Colored females.

NOTE.—These letters, a, b, c, d, are used in these tables always to indicate race or sex as here indicated.

2. Number of pupils enrolled on the school registers (excluding duplicate registrations), classified by race and sex (a + b + c + d).

NOTE.—The plus sign (+), when used, indicates that the items between which it is placed are taken separately. Thus, a + b means that the white males and white females are given separately. Where this plus sign is omitted, the items are not given separately in the reports.

3. Average daily attendance classified by race and sex.
4. Average length of school year (days or months).
5. Number of teachers, classified by race and sex.
6. Number of pupils receiving kindergarten instruction, classified by race and sex.
7. Number of pupils receiving elementary instruction (including kindergarten pupils), classified by race and sex.
8. Number of pupils receiving secondary instruction, classified by race and sex.
9. Number of students receiving higher instruction, including colleges, schools of medicine, theology, law, technology, classified by race and sex.
10. Number of students in special schools, classified by race and sex, including trade schools, evening schools of all kinds, manual training schools, schools for the defective and dependent classes, reform schools, commercial schools, and nurses' training schools.
11. Number of buildings used as schoolhouses.
12. Total seating capacity of such buildings (number of pupils that can be accommodated).
13. Value of all property used for school purposes.
14. Average monthly salaries of teachers, classified by race and sex.
15. Total school revenue.
    (1) Income from productive funds and rents.
    (2) State school fund.
    (3) Local taxes.
    (4) Other sources.
16. Total expenditure.
    (1) Salaries of teachers (including supervision).
    (2) Other current expenses.
    (3) Permanent expenditure (for buildings, grounds, etc.).
17. Amount of permanent invested funds.

Digitized by Google

II. Less Essential but Desirable Items.

18. Age classification of pupils enrolled.
    (1) Number of pupils under six.
    (2) Number of pupils between six and seven, etc.
    * * * * * * *
    (11) Number of pupils between fifteen and sixteen.
    (12) Number of pupils over sixteen.
19. Number of cases of tardiness.
20. (1) Number of pupils born within the State.
    (2) Number of pupils born in other States.
    (3) Number of pupils born in foreign countries.
21. Occupation of parents.
    (1) Agents.
    (2) Bankers and brokers.
    (3) Clerks and salesmen.
    (4) Domestic servants and waiters.
    (5) Draymen and teamsters.
    (6) Farmers.
    (7) Factory and mill operatives.
    (8) Hotel and boarding-house keepers.
    (9) Laborers (unskilled).
    (10) Manufacturers.
    (11) Mariners and boatmen.
    (12) Mechanics and artisans.
    (13) Miners and quarrymen.
    (14) Merchants, traders, and dealers.
    (15) Professionals.
    (16) Public officials and employees.
    (17) Railroad employees.
    (18) Seamstresses.
    (19) Saloon keepers and bartenders.
    (20) Unclassified.
22. Average number belonging, including temporary absentees.
23. Number of pupils in each branch of study.
24. (1) Average age of kindergarten pupils.
    (2) Average age of elementary pupils.
    (3) Average age of secondary pupils.
    (4) Average age of higher pupils.
    (5) Average age of special pupils.
25. (1) Number of normal schools.
    (2) Enrollment in normal department.
    (3) Average attendance.
    (4) Number of teachers.
    (5) Expenses.

III. Occasional Items.

26. (1) Number of teachers who have taught less than two years.
    (2) Number from two to five years.
    (3) Number over five years.
27. (1) Number of applicants for teachers' certificates.
    (2) Number who are certified.
28. (1) Number of teachers graduates of normal schools.
    (2) Number of teachers graduates of universities and colleges.
    (3) Number of teachers graduates of high schools, academies, etc.
    (4) Number of teachers who have received only an elementary education.
29. Number of pupils dropped and readmitted in the course of the year.
30. Number of hours in each school session.
31. Length of recesses or intermissions, and time of beginning.
32. Number of cases of corporal punishment.
33. Number of pupils promoted to next higher grade.

APPENDIX III.

Giving the definitions of certain technical terms used in educational reports, together with their equivalents in certain foreign countries.

TECHNICAL TERMS USED IN EDUCATION—DEFINITIONS AND FOREIGN EQUIVALENTS.

1 (a). *School age.*—Age at which children are permitted free attendance at the public schools. This age varies in the different States, but 6 to 21 may be considered the representative school age in this country, being designed evidently to embrace all minors old enough to render school

Digitized by Google

instruction advisable and profitable to them. The children of school age in each State, whatever that age may be, collectively constitute the *school population* of such State.

NOTE.—There are, in the foreign countries considered in this vocabulary, no terms corresponding in significance to "school age" and "school population," as understood in the United States. In a popular sense, however, as used in literature everywhere, "school age" includes the period of life from the age of 4 or 5 years to adult age as the epoch most suitable for schooling.

1 (b). *Compulsory school age.*—The age at which children are obliged by law to attend school in those States of the Union having compulsory school laws. This age also varies in the several States, but 8 to 14 may be considered as the representative. The children subject to a compulsory school law constitute the "compulsory school population" of a State.

Eng. *Age for school attendance.*
Ger. *Schulpflichtiges Alter.*
Fr. *Âge scolaire.*
It. *Obbligo di frequentare la scuola.*
Sp. *Edad escolar;* or *edad de la obligación escolar.*

NOTE.—The compulsory school age in the foreign countries considered above varies, but 6 to 13 may be regarded as typical. All the children subject to compulsory school laws in England and France, and the major part of those in Germany, are allowed free instruction at public schools.

1 (c). *School population.* See 1 (a) and note.

1 (d). *Compulsory school population.* For definition see 1 (b).

Eng. *Population of school age.*
Ger. *Schulpflichtige Kinder.*
Fr. *Enfants d'âge scolaire;* or, *Nombre d'enfants à instruire.*
It. *Popolazione da 6 a 12 anni.*
Sp. *Niños en edad de escuela.*

2. *Enrollment.*—Number of different pupils enrolled (or entered) on the school registers during any given year; or, in other words, the entire number of different pupils who have attended at any time during the year.

Eng. *Number of children (or scholars) on registers.*
Ger. *Zahl der Eingeschriebenen.*
Fr. *Population des écoles;* or, *Nombre des élèves inscrits.*
It. *Numero degli iscritti.*
Sp. *Número de niños concurrentes* (or *inscriptos*).

3 (a). *Attendance.*—Number of pupils present (on any given day or at any given time).

Eng. *Attendance.*
Ger. *Frequenz,* determined on two test days (*Stichtage*) each year.
Fr. *Fréquentation,* or *Élèves présents,* determined as in Germany.
Sp. *Asistencia.*

3 (b). *Average attendance.*—Average number of pupils attending each day or session.

Eng. *Average attendance.*
Ger. *Durchschnitts-Frequenz.*
Sp. *Asistencia media;* or *Promedio de la asistencia diaria.*

4 (a). *School year.*—(1) The year, or period of twelve months, for which school officials are elected, appropriations of money made, teachers hired, school reports made, etc., though the annual epoch of some of these features sometimes dates from a different day than that of others. In the United States the school year usually begins the 1st of July, or some other day during the summer vacation. The term is sometimes restricted to (2) that portion of the school year during which the schools are in actual session.

Eng. *School year.* "A year or other period for which an annual parliamentary grant is . . . paid or payable." It "is the year ending with the last day of the month preceding that fixed for the inspectors' annual visit."—Ed. Acts Man., 17 ed., p. 375.
Ger. *Schuljahr.*
Fr. *Année scolaire.*
It. *Anno scolastico.*
Sp. *Año escolar.*

4 (b). *Length of school year.*—The number of days, weeks, or months the schools were in actual session during the school year. The expressions "length of schools," "duration of schools," "length of school term," etc., are also used. The *average length of the school year* is the average of a group of schools in which the number of days of session varies. As in most foreign govern-

Digitized by Google

mental school systems the number of days is nearly uniform, this latter term has little application outside the United States.

Eng. *Number of times school has kept* This must be divided by two to get the number of days.
Ger. *Dauer des Schuljahres.*
Fr. *Durée de l'année scolaire.*
Sp. *Número de dias de clase.*

5. *Teacher.*—An instructor in an elementary or secondary school.

Eng. *Schoolmaster, schoolmistress, teacher.*
Ger. *Lehrer, Lehrerin; Oberlehrer.*
Fr. *Maître, maîtresse, instituteur, institutrice.*
It. *Insegnánte, maestro, maestra.*
Sp. *Maestro, maestra.*

6. *Kindergarten.*—A school for young children, from about three to six years, conducted after the methods of Froebel.

Eng. *Infant school, or class.*
Ger. *Kindergarten.*
Fr. *École maternelle.*
It. *Asili d'infancia.*
Sp. *Jardin de infantes.*

7. *Elementary instruction.*—Instruction in the first principles or rudiments of knowledge, including chiefly reading, writing, spelling, arithmetic, grammar, geography, United States history, and often the outlines of natural history and science, the pupil being prepared by this course to enter upon algebra and Latin or some modern language. Usually in the United States the first eight years of a fully graded public-school course mark the period of elementary instruction, the child entering at the age of about 6 years. *Elementary schools* are schools in which elementary instruction is the sole or predominating feature. These, in a fully graded course, may be subdivided into *primary schools* (first four years) and *grammar* (or *intermediate*) *schools* (second four years). Kindergarten instruction is also classed as elementary.

Eng. *Elementary instruction.*
Ger. *Elementar-Unterricht.*
Fr. *Enseignement primaire* (excluding the "primaire supérieur").
It. *Istruzione elementare.*
Sp. *Enseñanza primaria.*

8. *Secondary instruction.*—This is supposed to begin the ninth year of the course of study, and to take up algebra, geometry, natural philosophy, physical geography, Latin, Greek, French, and German, for some or all pupils, and for a whole or a part of the four years; also an outline study of universal history, English literature, and some of the special natural sciences, as geology, human physiology, botany, etc. A *secondary school* is a school whose ultimate object is to give a secondary education, and which may or may not have a preparatory course of elementary grade, or pupils pursuing elementary studies.

Eng. *Secondary* (or *intermediate*) *instruction.* The term "secondary schools" in England is applied to certain groups of schools designed for the education of the upper and middle classes, including *endowed grammar* (i. e., classical) *schools, endowed nonclassical schools, private schools,* and *proprietary schools.* These are also known as *middle-class schools.* They receive pupils at about the age of 8, continue them in their elementary studies, and carry them along to an age varying from 14 to 19, giving them an education in some cases higher, in others—especially in the "private" schools—not so high as is indicated by the term secondary in the United States The nine great *public schools* of England (Eton, Harrow, etc.), which are properly "intermediate" schools—i. e., standing between preparatory primary schools or private tutors and the "universities"—receive pupils from 10 to 15, and are of higher grade than most of the secondary schools of the United States. *Higher board schools* have developed in some of the large cities, and correspond nearly to our public secondary schools (high schools), giving to the children of their people an opportunity to continue their education beyond the elementary grade. About 80,000 pupils pursue high-school subjects in elementary schools.
Ger. *Höherer Unterricht* (*i. e.*, higher than that given in the Volksschulen).
Fr. *Enseignement primaire supérieur.* The instruction given in the *Division de grammaire* of *lycées* and *collèges communaux* also belongs here.
It. *Istruzione secondaria.*
Sp. *Enseñanza secundaria.*

9. *Higher* (or *superior*) *instruction.*—This is supposed to take the fourth epoch of four years in a complete course of education, secondary taking the third four years, and elementary educa-

Digitized by Google

tion the first eight years By topics and methods, the higher education is distinguished by taking mathematics in those branches which succeed plane geometry and elementary algebra; Latin and Greek writers, that require more maturity of reflection to master, such as Horace, Livy, Tacitus, Juvenal, Cicero's moral essays, Homer, Demosthenes, Plato, Æschylus, Sophocles, Euripides, Aristotle; physics treated by mathematics; rhetoric; mental philosophy; the philosophy of history. In general, the studies of higher education are conducted on a comparative method, with the purpose of treating each theme in the light of all branches of knowledge. A *higher institution* of learning is one whose ultimate object is to give a higher education, and which therefore may or may not have a preparatory department, in which instruction is given in secondary or even elementary branches.

Eng. *University instruction; collegiate instruction.*
Ger. *Hochschulunterricht.*
Fr. *Enseignement supérieur.* The last three years of the *enseignement secondaire* is also of the higher grade, according to the United States standard.
It. *Istruzione superiore.*
Sp. *Enseñanza universitaria.*

10 (a). *Special schools.*—Schools of elementary or secondary grade, which (1) educate for some special trade, business, or occupation (e. g., commercial colleges, art schools); or (2) educate some special class of persons (e. g., deaf-mutes, juvenile delinquents).

Sp. *Escuelas especiales.*

10 (b). *Evening schools.*—A class of special schools, generally public and located at the centers of population, designed to give evening instruction in elementary and sometimes in secondary branches, general and technical, to persons whose occupation, age, or both, prevent them from attending the day schools. A special feature of evening schools in some cities of the United States is the instruction of foreigners in the English language.

Eng. *Evening schools.*
Ger. *Fortbildungsschulen (elementar).*
Fr. *Classes d'adultes.* (Held in the evening or on Sunday.)
It. *Scuole serali.*
Sp. *Clases nocturnas.*

10 (c). *Evening high schools. Continuation schools.*—A class of evening schools, designed more particularly to give some degree of secondary education to youths who are obliged to go to work after finishing their elementary education in the day schools.

Ger. *Höhere Fortbildungsschulen.* (Evenings or Sundays.)

11. *Schoolhouse.*—A building used for school purposes, one in which instruction is given

Eng. *School building.*
Ger. *Schulhaus.*
Fr. *Maison d'école.*
It. *Edificio-scolastico. Locale per le scuole.*
Sp. *Casa de escuela.*

12. *Number of sittings for study*, excluding those used only for recitation purposes.

Eng. *Accommodation, number of seats.* Includes all seats, being total seating capacity.
Sp. *Area de las salas de clase.*

13. *School property.*—All property, real and personal, belonging to a school system (i. e., not hired or rented), and designed to be used for school purposes, including school sites and buildings, furniture, libraries, apparatus, etc.

Eng. *School buildings, premises, and furnishing.*
Ger. *Schul-Eigenthum.*
Fr. *Bâtiments et matériaux scolaires.*
Sp. *Edificios, menaje, y útiles escolares.*

14. *Salary* (or *wages*) *of teachers.*—The sum paid to teachers weekly, monthly, or annually, as compensation for their services. In computing the *average monthly salaries* of any group of teachers, weekly and annual salaries must be reduced to a monthly basis.

Eng. *Salary.*
Ger. *Gehalt.*
Fr. *Traitement.*
It. *Onorario stipendio.*
Sp. *Sueldos.*

15. (a). *Revenue* (school).—Money from any source received for school purposes.

Eng. *Income.*
Ger. *Einnahmen.*
Fr. *Ressource.*
It. *Rendita.*
Sp. *Ingresos.*

Digitized by Google

15 (b). *State* (school) *tax.*—A uniform tax levied on all the property or polls of a State, the proceeds whereof is apportioned to the counties, towns, or school districts generally, according to school population or average attendance.

Eng. *Rates.*
Ger. *Staats-Schulsteuern.*

CHAPTER XXX.

MEDICAL INSPECTION OF SCHOOLS.

A system of daily inspection of schools by physicians has been introduced in several cities, among others Boston, New York, Chicago, Philadelphia. In the following pages is given a compendium of information bearing upon this subject, in a series of extracts from school and other official reports, from the writings and addresses of eminent professional men, and from other sources. A short description of the system in Paris is also given.

MEDICAL INSPECTION OF SCHOOLS IN BOSTON.

[Massachusetts State Board of Health Report, 1894, p. 819.]

The need of medical inspection of schools, for the purpose of detecting contagious and other diseases among the school children, was brought to the attention of the mayor and city council in 1892, and for this purpose an appropriation was then secured. A delay of several months was occasioned in securing the approval of the school committee, so that the plan did not finally go into operation until November, 1894, when the board of health selected 50 physicians for this purpose, divided the city into 50 school districts, and began school inspection. These physicians are appointed medical inspectors of schools and agents of the board of health, and are authorized to visit each school daily during the early part of the morning session and to examine all pupils who complain or appear to the teachers to be ill. If an inspector finds a pupil showing symptoms of any contagious disease, or is otherwise too ill to remain in school, he will advise the teacher to send the pupil home for the temporary observation of its parents or family physician. He will also give such professional advice as may be required by the teachers to aid them in carrying out all laws and regulations pertaining to contagious diseases, vaccination, and general school hygiene, whose enforcement belongs to the school committee or board of health. In the examination of throats the medical inspectors will use only the wooden tongue depressors which are furnished by the board of health, each of which is to be burned after a single use.

The medical inspectors of schools are also authorized agents of the board of health, and will, on notification of said board, visit all cases of scarlet fever and diphtheria at the homes of the patients, for the sole purpose of examining the places and plans of their isolation, and as such agents they will report to the board of health their approval or disapproval of such places and plans of isolation. Such medical agent will not prescribe, advise, or criticise anything beyond that which pertains strictly to the isolation of the patient, and will carefully avoid any word or act which may be construed as an infringement upon the rights of the family or attending physician. He will visit the patient as often as may be necessary to inform himself as to the continued isolation of the case. No case of scarlet fever or diphtheria will be discharged from isolation until its complete recovery is certified to the board of health by one of its medical agents, and such certificates of recovery will be based on the complete disappearance of desquamation in cases of scarlet fever, and on the absence of the Klebs-Lœffler bacillus in cases of diphtheria, the latter to be shown by bacteriological examination made satisfactory to the board of health.

The reports of the medical inspectors of schools for the months of November and December show that 4,962 pupils were presented to them for examination. Five hundred and sixty-four were found to be too ill to remain in school for the time being, 212 were suffering from contagious diseases, 43 were suffering from diphtheria, and 131 were too ill from troubles in the eyes and ears to be in school.

Digitized by Google

Diseases of the throat were most prevalent, and were found in 1,749 pupils. Diseases of the eye, ear, and spine are found sufficiently often among the school children to warrant a more careful examination to find those who may be suffering from mild forms or early stages of these diseases. It often happens that school children suffer serious and unrecognized disadvantages by reason of defective eyesight, deficient hearing, or a commencing deformity of the spine. The mild forms and early stages of these ills would not generally be seen and appreciated by the teachers, and it would be unreasonable to expect them to detect illness which requires special skill on the part of the physician to recognize.

The board of health reported that "diphtheria became epidemic during the year (1894), causing 817 deaths, and its increase was noticeable in every month of the year over those of 1893. It assumed an epidemic form in the last week of September, reached its climax about the first week in December, and gradually fell off at the end of the year. * * *

"The prevalence of the disease in epidemic form made it possible for the board of health to introduce three new forces for the suppression of the disease. One is the new remedy, 'antitoxin;' * * * another agent has been found in the use of the bacteriological laboratory. * * * The third and probably most potent agency in controlling the spread of this disease and that of scarlet fever is the new force of 50 physicians for the daily inspection of the schools, in which there are more than 70,000 of the most susceptible subjects to these two diseases. This has set in practice the most active, constant, and skillful watchfulness for the earliest symptoms of these and other diseases among school children."

[Massachusetts State Board of Health Report, 1895, p. 756.]

The inspection of schools, which was commenced in November, 1894, and described fully in our last annual report, has been followed through the year with excellent results. The schools have been visited daily, and all children who have complained of illness or appeared to the teachers to be ill have been examined by the visiting physician, who, in all cases, advises the teachers what to do with the pupil. This work has now been in progress for fourteen months, and it has demonstrated the fact that there are not only many cases of contagious diseases to be found in the schools, and which require early recognition and removal, but that there are large numbers of school children whose illness and whose disposition by the teacher require the decision of a competent physician.

For the fourteen months ending December 31, 1895, 16,790 pupils were examined, 10,737 of whom were found to be ill, 6,053 were found not to be ill, and 2,041 of these were too ill to remain in school for the day.

Seventy-seven cases of diphtheria, 28 cases of scarlet fever, 116 of measles, 28 of chicken pox, 69 of pediculosis, 47 of scabies, 47 of mumps, 33 of whooping cough, and 8 of congenital syphilis were found in children sitting in their seats, spreading these diseases to other children. The remaining 10,372 sick children were suffering from a large variety of other diseases.

Commendable efforts were made by the board in the direction of a general improvement of the sanitary condition of the schoolhouses of Boston. In view of the fact that contagious diseases may easily be spread in the schools through the medium of infected books, pencils, sponges, slates, desks, and other surfaces of the schoolroom handled or used by the children, the following recommendation was made to the school committee in 1894:

To the Honorable School Committee, City of Boston.

GENTLEMEN: The board of health begs respectfully to recommend that the desks, chairs, window sills, wainscotings, doors, doorknobs, and such other surfaces as are likely to be handled by the children within the school buildings be carefully rubbed with cloths or sponges, wet with a solution of corrosive sublimate (one part of corrosive sublimate to 1,000 parts of water), as often as every Saturday during the school year; that the floors of the schoolhouses be well covered with sawdust, thoroughly wet with the same disinfecting solution, at least once a week, and the sawdust swept up and burned; that the use of all slates, slate pencils, and sponges for slate use be discontinued, and that paper and lead pencils be substituted.

The disinfection of books is scarcely practicable except by fire, and the board would recommend, whenever it is known that a book has been handled by a pupil who was at the time affected with a contagious disease, or the book is otherwise much soiled, it be immediately burned.

Very respectfully,

THE BOARD OF HEALTH,
By S. H. DURGIN, *Chairman.*

Digitized by Google

[Massachusetts State Board of Health Report, 1896, p. 870.]

There were 72 fewer deaths from diphtheria than in 1895, although the number of cases of diphtheria reported was largely increased on account of the larger number discovered among the pupils in the public schools by the medical inspectors of schools and the bacteriological tests in the otherwise unrecognized cases. The ratio of deaths to the number of cases of diphtheria reported was 11.48 per cent, as against 14.48 per cent the preceding year.

The medical inspection of schools has been continued during the past year, with the same encouraging and satisfactory results as during the previous fourteen months. All pupils who have complained or appeared to their teachers to be ill have been examined by the visiting physicians, and the teachers advised as to what should be done with such pupils. The teachers and visiting physicians have entered upon and pursued this work with surprising harmony. The search for infectious diseases in the schools during the last year has been even greater, while the number of cases in this class found in 1896 is less than that of 1895. The same is true also of the other miscellaneous diseases. Considerable inquiry has been made by officials of other cities as to our methods and results in this work, and several cities are now preparing to adopt a similar system.

For the year ending December 31, 1896, the whole number of pupils examined was 8,964, and of this number 1,156 were found to be too ill to remain in school. The diseases found may be classified as follows:

Specific infectious diseases	267
Oral and respiratory diseases	3,934
Ear diseases	66
Eye diseases	382
Skin diseases	628
Miscellaneous diseases	3,687
Total number of examinations	8,964

MEDICAL INSPECTION IN NEW YORK CITY.[1]

At a meeting of the New York board of health held March 16, 134 medical inspectors were appointed for public schools, in accordance with the provision recently made by the city authorities at the recommendation of the health department, indorsed by the board of education. Dr. A. Blauvelt, formerly assistant chief of the bureau of contagious diseases, was appointed chief inspector at an annual salary of $2,500.

Some results of school inspection in New York City.[2]

The weekly report of Dr. Blauvelt, chief of the bureau of school inspection, for the week ending April 10, shows that in the public and parochial schools of the city 7,398 children were examined and 364 excluded. The number of cases of disease were as follows: Measles, 2; diphtheria, 13; scarlet fever, 1; croup, 3; whooping cough, 4; mumps, 10; contagious eye diseases, 59; parasitic diseases, 227; chicken pox, 15; skin diseases, 19.

Dr. Blauvelt, chief of the medical school inspectors, in his report to the health board[3] of the work of the school inspectors for the week ending April 23, stated that out of 4,599 examined, 243 children were excluded. There were 4 cases of measles, 4 of diphtheria, 1 of scarlet fever, 2 of croup, 13 of mumps, 8 of chicken pox, 28 contagious eye diseases, 160 cases of parasitic diseases of head and body, and 13 skin diseases.

IN CHICAGO.[4]

For the supervision of contagious diseases and the inspection of schools the city has been divided into 9 districts, one medical inspector being assigned to each, giving an average of more than 20 square miles for each inspector to cover, and the number of schools assigned to each is about 30, with branches varying in number from 10 to 20.

IN PHILADELPHIA.

June 7, 1898, the bureau of health—

Resolved, That the medical inspector be directed to have the 15 assistant medical inspectors visit one public school each day in their respective districts, who shall inspect each school according to the methods now employed in Boston, New York, and Chicago.

MEDICAL INSPECTION OF SCHOOLS IN ST. LOUIS.[1]

The members of the Medical Society of City Hospital Alumni of St. Louis have offered their services gratuitously to the board of education for the purpose of conducting a daily medical inspection of the pupils in certain schools in order, they say, that a practical local test may be made of a service that has been found so valuable in a sanitary sense in other cities. It is proposed to select 10 schools which will fairly represent the entire school population and have them visited daily during October, November, and December by physicians whose duty it will be to advise the several principals in the cases of pupils found ailing and suggest the most judicious course to be pursued—the object of the service being the earliest possible detection of such diseases as diphtheria, scarlet fever, croup, etc., and the prevention of their further spread. This offer has been accepted by the St. Louis board of education, and the preliminary details are now being worked out by the committee of the Medical Society of the City Hospital Alumni.

BROOKLINE, MASS.[2]

The board voted December 10 that the agent should secure a sufficient number of physicians to make daily medical inspections of the schools. Six inspectors and 4 substitutes were at once appointed. All accepted were assigned to schools, and on the 11th all were at their posts. The duties of the inspectors were mainly confined to the examination of children found by their teachers to be ill, and also any noticed by the inspectors, and advice as to the disposal of sick children, and with very few exceptions the teachers heartily cooperated.

MEDICAL INSPECTION IN NEWTON, MASS.[3]

The plan of appointing medical inspectors for each ward or school district, on whom the board can call to examine the children in a school or elsewhere in the event of suspected cases, has worked most satisfactorily. Several school inspections have been made and a large number of children have been examined at their homes by the inspectors; in several instances unsuspected cases of disease have been discovered and reported to the board, thus enabling it to take proper precautions. No complaint in regard to the interference by the inspectors with the work of the family physician has been reported, and the board will continue the system during the coming year.

DESIRED IN LOWELL, MASS.[4]

A. K. Whitcomb, superintendent of schools in Lowell, Mass., says: No consideration is more important than the health of children. Education gained at the expense of health is a loss, and a sound body is a price too great to pay for even a whole world of knowledge. Nor do unsanitary conditions at school affect the children alone. One-seventh of Lowell's population is in school, and this seventh inevitably carries disease, if it finds it in the schoolhouse, into every family in the city. Hence the superlative importance, not only to the children, but to every citizen, of expert supervision of the schools, the schoolhouses, and of all the physical conditions under which the children live in school.

Most of the great tuition schools abroad, and many here, have a resident physician for the prevention rather than the cure of disease, and the value of their work is beyond question. In the public schools medical inspection, where there is any, usually takes the form of visits at intervals of several months rather than of daily calls. In Boston 49 physicians are employed at a nominal salary of $200 per annum to visit every school each day and examine pupils of whose fitness to

[1] New York Medical Record, October 15, 1898.

[4] Lowell School Report, 1896, p. 46.

Digitized by Google

remain the teacher has a doubt. In the first month of such visitation 437 sick children were found in school, among whom were 37 ill with diphtheria and 104 with scarlet fever. These startling figures tell their own story and leave no need of argument to prove the value of the work. * * * A phase of the subject which has been attracting widespread attention in recent years has been the study of children physically defective, the defects most noted being those of sight and hearing. Tests in Europe and in this country have shown a startling prevalence of these defects, which have been unsuspected by either child or parent. A child, for instance, blamed for stupidity because he had learned nothing in several months, was found to be so defective in vision that he had never seen a letter clearly enough to distinguish it from others. And scores of cases as pitiable, where not only education but health and life itself have been imperiled or lost through such unsuspected deficiencies, have come to my personal knowledge and have brought me to feel that anyone who reveals such defects and puts them in the way of cure or mitigation is second to none as a public benefactor. To discover such cases in the Lowell schools, in order that parents may, if they please, secure for their children such treatment as will most benefit them, is one of the reasons why I plead for medical inspection.

I have not myself yet seen the need of daily visits by many physicians. My ideal is to have one who shall give his whole time to the work, though I shall not at all object to a cooperating board of daily visitors at a nominal salary. The man selected should be an expert in sanitation as well as a skilled physician. He should go to each house, should begin with the basement and see that it is clean, dry, and well ventilated; should inspect the plumbing and see that sanitaries are in perfect order; should enter the schoolrooms and have regard to temperature, ventilation, light, curtains, the position and use of blackboards, the size and position of seats and desks; should test the air of schoolrooms for carbonic oxide or other noxious gases; in short, should interest himself in everything which pertains to the physical well-being of the child. He should be constantly on the watch for contagious diseases; should have power to send home children too ill to be in school, and in this should be in close touch with the board of health, of which he might well be a member. He should test for physical defects of sight and hearing, and should see that parents are notified of matters needing their attention, and so on through a round of useful duties too numerous to be specified.

IN FALL RIVER, MASS.[1]

William C. Bates, superintendent of schools in Fall River, Mass., says: In my report last year I called attention to the medical visitors in the schools of the city of Boston. The experience of this year has shown that such a service of daily visitation is much needed here. The room teachers, the principals of buildings, the truant officers, and the clerks in the office do all in their power to guard the children from contagious diseases. If these efforts could be supplemented by the regular visits of physicians, more immediate and positive action could be taken in suspicious cases. We are under very great obligation to the agent of the board of health and the city physicians for almost daily visits to the Robeson and Columbia street schools while contagious diseases were prevalent in that district. More care than ever has been taken to exclude all children from families afflicted with measles and all children who have the whooping cough, but even in these diseases we feel the need of the medical visitor in order that we may be sure that the right action is taken.

COMMENDED IN WASHINGTON, D. C.[2]

Among other notions that have been introduced into the public schools of Boston is a daily medical inspection. The city employs for this service 50 doctors at a salary of $200 a year. It is stated that bright young members of the medical profession are glad to accept such appointments, and it can readily be seen that such an introduction into business may be advantageous. The work occupies but a small part of the day. During the last school year this inspection disclosed 500 cases of infectious diseases, while 3,000 pupils were sent home. The list of diseases discovered included 200 cases of mumps, 100 cases of measles, and 175 cases of diphtheria, scarlet fever, whooping cough, chicken pox, and influenza.

Diphtheria is now extremely prevalent among the school children of Worcester, and the Worcester Telegram urges that the Boston plan be applied in that city. "Ten physicians," it says, "ought to be able to make the daily rounds of Worcester

[1] Fall River School Report, 1898, p. 20. [2] Washington Post, November 18, 1898.

Digitized by Google

schools if 50 can cover the ground in Boston, and $2,000 will be wisely spent paying them."

We do not know just how much time is devoted to the daily inspection or whether it includes all the scholars, or only such as seem, from general appearance, to need attention. If it could be so managed as not to interrupt the regular progress of school work, it would be desirable in the schools of all cities. The cost would be trivial in proportion to the probable results.

SOME RESULTS OF THE MEDICAL INSPECTION OF SCHOOLS IN BOSTON, WITH AN ACCOUNT OF AN EPIDEMIC OF DIPHTHERIA AND AN EPIDEMIC OF SCARLET FEVER.

[By H. D. ARNOLD, M. D., Boston, Mass.]

It has long been recognized that the schools are an important factor in the spread of contagious diseases. In addition to the fact that in any collection of large numbers of people within a small space we have a favorable condition for the spread of infection, there are certain factors in the schools which increase the danger. The children are of a susceptible age. Our schoolrooms are overcrowded and the ventilation is generally inadequate. In their play and in some of their school exercises the children come in close contact, and they still use many articles in common. They are careless in regard to the secretions of the mouth and nose, and the road is an easy one from mouth to hand, from hand to an article in common use, or to another hand, and again from hand to mouth. Given a case of contagious disease in a schoolroom and we could hardly ask for better facilities than are there furnished if we wished to spread the disease. Given a case of contagious disease anywhere in the school district and unless effective measures are taken to isolate it until all danger is past its chances of reaching the schoolroom are excellent. Given careless parents, and parents who are unable or unwilling to call a doctor to pronounce on the nature of apparently slight affections of the throat, etc., and we have the most mischievous factor of all in the spread of contagious diseases, namely, the appearance in public of these diseases in a form which is light and unrecognized by the laity. That these unrecognized light cases find their way into the schoolroom has been the experience of every school inspector. That such light cases may give rise to serious and even fatal forms of the disease in others we all know. That it has done so through the medium of the school some of the inspectors can prove.

In view of these considerations, I think we can not question the wisdom of the board of health in attempting to detect cases of contagious disease at the schoolroom and to exclude them before they have done mischief, and in attempting to secure better isolation of cases of contagious disease at home as soon as they are recognized. These are the two aims of the system of school inspection.

The city of Boston, for this purpose, has been divided into 50 districts, to each one of which a medical inspector is assigned. The average is four schoolhouses and 1,400 pupils to each district. It is the duty of the inspector to visit the schools daily; also to visit at their homes all cases of diphtheria and scarlet fever when they are reported to the board of health, for the purpose of reporting in reference to isolation.

At the schools we do not attempt to examine all the pupils, but only those who are called to our attention by the teachers. It was felt that the teachers, who are constantly with the children, would be more likely to notice that a child was "ailing" than would a physician in making so hasty an inspection of each case as he would be obliged to make if he attempted to see them all. The teacher picks out the "ailing" child, the doctor examines and decides what the ailment is. Practically this plan has worked well, although its weak point is that its efficiency depends entirely upon the conscientiousness and the keenness of observation of the teacher. Our visit to the schools is made, by preference, soon after the morning session begins, having allowed enough time for the teachers to observe the pupils, to inquire for cases of sickness, and to report them to the master. This shows another weak point, namely, that any contagious case that comes to school still has an opportunity during a varying length of time to infect other pupils in the room before the disease is recognized. Still, owing to the shortness of the time, and in some cases to the good judgment of the teachers in sending a suspicious case out of the room while waiting for the doctor, the practical result is fairly satisfactory. A perfect system of medical inspection of schools should not, however, be based so fundamentally upon the judgment of a nonmedical observer, the teacher.

When a pupil is presented to us for examination we have several questions to decide. Is he sick or not? If sick, is the disease of a nature to render him a possible source of danger to the other pupils, or is it of such a nature or severity as to

Digitized by Google

render his stay in school prejudicial to himself? If a positive answer is given to either of these questions we recommend to the teacher that she dismiss the pupil. Usually a verbal or written message (according to age and intelligence) is sent home with the pupil, explaining the circumstances, and if the inspector thinks the pupil needs medical care he adds the recommendation that the family physician be consulted. We do not prescribe for nor give advice to any pupil at the school. They receive no treatment whatever from us, except in the case of emergencies, when such assistance as is demanded on the spot is given. In regard to diagnosis, only so much is said as is essential to explain the action taken. We prefer to say "sore throat," instead of diphtheria or tonsilitis, as the case may be. In other words, when we meet a case of sickness in the school, it is our aim to try not to interfere in any way with the rights of the family physician, certainly not to treat his cases or to indicate what diagnosis or treatment is proper.

There are cases, however, where the question of the safety of the other pupils demands that an investigation should be carried out beyond the schoolroom and at the pupil's home. Here the inspector is placed in a delicate and sometimes an embarrassing position, and good judgment must be exercised. Sometimes this investigation is best undertaken through or in company with the family physician. Oftentimes, however, we feel that it is neither right to put the people to the expense of consulting a physician nor the physician to the trouble of giving a free consultation. Especially is this the case among people who are in poor or moderate circumstances and where the question at issue is one of only slight suspicion or doubt on our part. It would seem in such cases, where it is a question of public safety (not of benefit to the individual), that the investigation might rightly be undertaken by the public medical inspector, provided he makes it plain that he is acting solely in an official capacity for the public good.

Our main duty at the school is, then, to examine such pupils as are reported to us as being ailing, to advise the teacher whether the pupil should be sent home either for his own good or for the safety of the other pupils, and to recommend such pupil to the care of the family physician if medical care seems advisable. Incidentally other duties come up. We examine and give certificates of vaccination to such pupils as enter the schools without the required certificate. We vaccinate pupils who have not been vaccinated, if after suitable inquiry we find the family is in real poverty, but not otherwise. We also advise the teachers with reference to the return of pupils after an absence for sickness, when the only evidence in their possession is a note from the parents. Similar advice is sometimes called for when there is a note from a physician. Not that the diagnosis of the physician is subject to criticism, but that sometimes such notes do not furnish the information which is required to enable a pupil to return to school. I doubt whether you all realize that this requirement is determined by statute law, and that the regulation of the school committee is merely carrying out the public statutes of the Commonwealth. The following extract from chapter 198, acts of 1885, will make this clear:

"The school committee shall not allow any pupil to attend the public schools while any member of the household to which such pupil belongs is sick of smallpox, diphtheria, scarlet fever, or measles, or during a period of two weeks after the death, recovery, or removal of such sick person; and any pupil coming from such household shall be required to present, to the teacher of the school the pupil desires to attend, a certificate from the attending physician or board of health of the facts necessary to entitle him to admission in accordance with the above regulation."

By the regulations of the school board each teacher is obliged to keep a record of all pupils absent from school for a contagious disease either in their own person or in a member of the household and a record of the date of return and of the physician who signed the certificate for return. The teacher is kept posted as to the existence of contagious diseases among her pupils or their families by receiving for inspection each day a list of all contagious diseases reported to the board of health in the preceding twenty-four hours, with the addresses. When, therefore, a pupil returns after a contagious disease, with a note like the following: "In my opinion it is perfectly safe for A B to return to school. X Y Z, M. D.." the teacher has no authority to readmit the pupil. When this case is referred to the medical examiner, if he is not in possession of facts which enable him to fill out a proper certificate himself, he must refer the case back to the physician for a proper certificate, for he is not given authority to alter the statute law of the State.

We are also called upon sometimes by the teachers for advice about the hygiene of the schoolroom, etc., and sometimes the hygienic condition of the school calls for notice on our part. So there are a number of ways in which the daily visit of the school inspector may be of benefit to the health of the school children.

Digitized by Google

The school inspector also has duties outside of the school in connection with contagious diseases. Acting as the agent of the board of health, he visits all cases of diphtheria or scarlet fever reported to the board of health which lie in his district. He is required to report to the board of health whether the proper isolation required by them is being carried out. He is also required to certify when the danger of infection from the body of the person has ceased, and the case is ready for release from isolation, and the apartments ready for disinfection. Since the development of the method of determining the presence of the bacilli of diphtheria by cultures, that method has been adopted by the board of health as the proper test to determine when it is safe to release patients who have been sick with diphtheria. When the terminal culture taken by the family physician is found to be negative, the board of health has all the evidence required, and is ready to disinfect at once (without the intervention of its agent), provided the family physician indicates that the patient is otherwise ready, by marking the card that goes with the culture "For release." In such case, if the culture is negative, the laboratory notifies the board of health, and no other formality is necessary. In case the family physician is unable to take the culture for release, the board of health will, on request, send its agent, the school inspector, to take the culture.

In the case of scarlet fever, however, there is no bacteriological test possible to determine when the danger of infection ceases. As infection from a case of scarlet fever in its later stages commonly comes through the desquamating epithelium, the cessation of desquamation has been adopted by the board of health as determining practically the time when danger of infection ceases. That the desquamating epithelium is a medium by which the infection may be conveyed is, I believe, universally admitted by physicians. It is not universally recognized, however (if we may judge by certificates that "all danger of infection has ceased"), that the epithelium from the later stages of desquamation is dangerous. It is owing to the apparent differences of opinion among physicians on this point that the board of health has deemed it wise to require a statement from its own agent before releasing the patient and disinfecting after scarlet fever. It does not assume that its medical inspectors possess superior judgment or more knowledge of the diseases than the family physician, but merely that it can require them as its agents to report certain definite facts and can thus secure definiteness and uniformity in carrying out its regulations. We have no practical means of determining whether the desquamating epithelium in a given case at a certain stage is or is not infectious. The only safe rule seems to be that recommended by a committee from the school inspectors appointed to consult the medical authorities on this question—that desquamation in any stage must be regarded as dangerous.

As agents of the board of health, the school inspectors are, therefore, instructed not to recommend the release of a patient after scarlet fever until desquamation has entirely ceased, although the period required for this is often long enough to make the family, and sometimes the physician, restive.

During the winter of 1894–95 (the first winter of the work of school inspection) we had an epidemic of scarlet fever in the city of a fairly mild type, but typical. Of the cases which came under my observation as school inspector I secured definite information in twenty cases of scarlet fever as to the time from the beginning of the disease to the end of desquamation.

The average time was thirty-seven and one-half days from the first definite symptoms of the disease, and thirty-five and one-half days from the appearance of the rash. The shortest time, twenty-five days; the longest, sixty days. * * *

The usefulness of the inspector's work at the schools is shown not only by the statistics of the total number of cases examined, but by such results as are given in the following account of an epidemic of diphtheria. It occurred in a class room in a school under my charge, and it is interesting as showing how such an epidemic may be introduced and spread among the pupils of a class, as showing that an epidemic may be stamped out by prompt and efficient measures, and as illustrating some of the difficulties involved in the medical inspector's position.

The class was the lowest primary class, still using some of the kindergarten methods and having a number of articles in common use. It consisted normally of about 50 pupils, but had been reduced by absences for measles and other causes to about 40. The room was rather crowded, the school building an old one, with poor facilities for ventilation, and hence the hygienic condition was not of the best.

Of the 40 pupils it is known that at least 14 were sooner or later affected by diphtheria, and that at least 4 other children in the families of these children contracted the disease from them. There was 1 fatal case among the 14 pupils, and 1 fatality among the 4 who were infected by them. We have, then, an epidemic of 18 cases, with 2 deaths.

Digitized by Google

The earliest case in this epidemic attended school last on April 20, 1897, but owing to a combination of circumstances the existence of an epidemic was not recognized until May 5. One cause for the delay was that for some time there had been so many absences caused by measles, colds, etc., that the absences caused by 8 cases during the two weeks did not attract the teacher's attention as being unusual. The other principal reason was slowness on the part of physicians in reporting some of the cases to the board of health. Notice of the earliest case did not reach the school inspector until two days after the epidemic was discovered and sixteen days after the child was taken sick. One other case went directly to the hospital, another was outside my district for visiting the homes, and of the other 5 cases up to that time I had received word about only 2 by May 4. Finding that these 2 attended the same class, I went to the school May 5 to investigate. The teacher was already aroused in the matter, for she had that morning found on the board of health report 2 more cases of diphtheria from her class. She had also heard rumors from the pupils that two or three others had the disease, and she found 3 cases of sore throat in the room, the first time, by the way, that any of these cases had appeared to be at all sick while they remained at school.

It was at once apparent to me that we had an epidemic on hand. Four suspicious cases were sent home and recommended to the care of the family physician. The extent of the epidemic was investigated during the day. The board of health had arrangements made for disinfection at 9 the next morning. The class was allowed to assemble for purposes of investigation, every throat being examined and a culture taken in all suspicious cases. The class was then dismissed, and the formaldehyde generators set to work at once. This was on Thursday morning. After the disinfection the room was cleaned up, allowed to air for two days, and opened for school again on Monday. For a week and a half the throats of all pupils present in the class were examined the first thing in the morning. No child who had had any suspicious symptoms was allowed to return until a culture from the throat was found to be negative. As a result of these measures, notwithstanding the fact that the epidemic had made such good headway before discovery, not a single case of diphtheria developed after the epidemic was discovered except those known to have been infected at the time.

I am not sure that I have discovered the case which brought diphtheria into the class room. The first case that could be found after a diligent investigation attended school last on April 20. She was supposed by her parents to be well, and the teacher did not notice anything wrong. The next morning she complained of a sore throat, and her father saw some "white patches" in the throat. The presumption is that she had the disease on the 20th when she attended school and gave it to 4 other cases that developed from three to five days later. It is possible, however, that her case, as well as those immediately following, may have been caught in the schoolroom from some other case so light in its symptoms that at the time of investigation no trace could be found of it. It is instructive to learn, in reference to the virulence of the bacilli in light cases and after clinical symptoms disappear, that although this first case proved to be a light case and clinically a short one, a brother and a sister were taken sick on the 29th and 31st, after the beginning of the disease, owing to a relaxation of the isolation. Both the brother and the sister were seriously sick, and the brother died. The fatal case among the pupils of the class came among the 4 cases which I think were infected by the first case. With these two exceptions, the other cases in the epidemic were quite mild.

How little protection would come by trusting to the parents of some public-school children is shown by their action in the following cases:

Four cases were sent home at the time of the discovery of the epidemic on the morning of May 5. They all had suspicious-looking throats, and in view of the existing epidemic the diagnosis of diphtheria was warranted clinically. With each child was sent a note stating that there had been some cases of diphtheria in the schoolroom, that the child had a sore throat that probably was diphtheria, and that the school inspector advised calling the family physician. The doctor was not called in a single case. The mother of one of the children brought him back herself in the afternoon, and was abusive to the teacher for sending him home. I turned up just in season to get my share. I was informed that I did not know what I was talking about; that his nausea and vomiting and constitutional symptoms two days before were due to indiscretion in eating; that his sore throat was "simply tonsilitis," that he was subject to, and that the patches in the throat were of no importance. The other children might have diphtheria, but her boy didn't, "because he wasn't sick enough." She refused to let me take a culture, and was informed that the boy would not be admitted to the school until a negative culture had been obtained by myself, or, if she preferred, by her family physician. She did not go to the family physician until another week had elapsed,

Digitized by Google

when a culture proved negative. I feel reasonably sure, however, that an earlier culture would have been positive.

The three other cases returned next morning. Two brought verbal messages that they were well enough to come to school. The third brought a note from his father, saying that it was absurd to say his boy had diphtheria. Cultures were taken from all three throats, and all proved positive. The mother of one of these was not convinced even then. She called another doctor to prove that the school doctor was wrong, and discharged him when he obtained a positive culture, and she was only partially persuaded there was no trick to it when a third doctor also found a positive reply to his culture.

One other case is instructive. This boy was subject to tonsilitis, so his parents did not attach any importance to a sore throat, which began May 2. He returned May 5 and was examined. His throat was negative. I learned, however, that his brother, who slept with him, had a sore throat beginning the day before, May 4, and had stayed at home, but that he also was at school that morning in another room. He was sent for, and I found several characteristic patches in his throat. Thus a possible source of infection of another class was nipped in the bud. Both were sent home with a note recommending the family physician and stating what the trouble was. They did not consult a physician for ten days. Naturally the throats were cleared up then, and the physician, not understanding the full circumstances, gave them a note stating that they might return to school. Admission was refused until a negative culture was found. They proved positive, and the one from the class room which had the epidemic lasted positive for two weeks more. Had I allowed him to return without a culture he would have had two weeks in which to start another epidemic of diphtheria, which, while it might have been ascribed to imperfect disinfection of the room, would in reality have been due to my carelessness in taking it for granted that the throat was negative.

The epidemic of scarlet fever occurred in one of the lower boys' classes of the grammar school, the pupils averaging about 10 years of age. This epidemic was definitely traced to a pupil who was supposed by his parents to have German measles. Twelve cases of scarlet fever occurred among the other pupils; at least 1 case occurred in the family of an infected pupil, and 2 cases which disappeared from the class at the same time as the scarlet fever cases were diagnosticated "tonsilitis" and may perhaps have been light cases of scarlet fever. Leaving these two doubtful cases out of the count, the epidemic affected 13 pupils of the class and 1 outsider—14 in all. There was 1 death; the other cases were light. One case developed nephritis.

The original case attended school on May 18, and on returning from school in the afternoon his mother noticed he was red about his neck, and on undoing his clothes found his skin was red about his shoulders and upper chest. She was quite positive this condition had not existed at noon. Here is a case, then, at school on the afternoon of May 18, with scarlet fever in a state of efflorescence. The first case of scarlet fever to follow absented himself on May 21. This was Friday. Another case developed before Monday, May 24, and the third on May 24. This last case was extremely light and only stayed at home May 24 and 25. He returned with a story which did not arouse any suspicion on the teacher's part, May 26, and remained in school until the afternoon of June 7. He was examined by me that day without having the scarlet fever discovered, and was then taken out of school by his parents "lest he might catch the disease." The existence of scarlet fever was only discovered on June 16, when the attending physician, in seeking for an explanation of a nephritis, by careful search found a little desquamation about his toes. He very likely was a factor in the subsequent spread of the disease, The other factor was the return to school of the first case. He came the afternoon of May 24 and remained the morning of May 25. My visit was delayed that morning, especially at one of the schools, and I arrived just after the class had been dismissed. I found a note from the teacher saying this boy had returned with a note from his parents saying he had had German measles, and asking for instructions. I left word that German measles reported by the parents was to be treated as measles, and he must stay out two weeks. He returned for the afternoon session and was immediately sent home. He was in school, then, an afternoon and the following morning during the seventh twenty-four hours after the beginning of the rash. This was May 24 and 25. On May 28 two cases disappeared for scarlet fever; on June 1 five cases (and one of the "tonsilitis" cases); on June 4 one case, and on June 8 one case (and the second "tonsilitis" case).

The epidemic was not discovered until June 3. By that time nine cases were out for scarlet fever besides the so-called German measles case. That morning only the second of these had appeared on the board of health report, and the teacher had heard through the pupils doubtful rumors of one or two other cases.

Digitized by Google

The real gravity could not be realized, but there was enough to lead me to institute an investigation. That day was spent in inquiring about the cause of absence of those pupils who were out, and in following up two or three false clues as to the origin of the trouble. The next morning I knew better how much of an epidemic we had, and hunted for the source among the pupils present. Nothing was found. That afternoon in following other clues I investigated the case of "German measles" and found that it was scarlet fever. The next morning, June 5, the room was disinfected by the board of health. For ten days after that the pupils were examined at the opening of the session. No new cases developed except one on June 8, who was undoubtedly infected before disinfection was done. On June 16 I learned of the case which had developed nephritis. As he had attended school one session on June 7 after disinfection, the room was again disinfected June 17. This was the end of the trouble.

MEDICAL INSPECTION OF SCHOOLS.[1]

[By SAMUEL H. DURGIN, of Boston Board of Health.]

The influence of schools upon the spread of infectious diseases and the need for the exercise of greater public care over the schools have been much discussed within the last few years and with nearly unanimous conclusions. I think we should all agree upon the fact that the collection of large numbers of persons within small spaces, generally speaking, furnishes the most favorable opportunity for the spread of infectious diseases, but more particularly with school children whose susceptible age and familiar habits render them unusually liable to the incidence and extension of these diseases. We shall also agree that the infective agent is frequently present in our public schools, and that it only remains to be shown by what means the infection is conveyed.

We need to consider but two of the most common and dreaded infectious diseases—diphtheria and scarlet fever—and perhaps diphtheria alone would be sufficient.

It was thought from the beginning of our knowledge of diphtheria until within a few years that it belonged in the list of what has been termed filth diseases, and with this view in mind boards of health followed out different lines of work for the purpose of proving or disproving the theory that this disease might be caused by any unsanitary conditions.

In 1878 the board of health, with which I am identified in Boston, called for reports of cases of diphtheria, and for the last nineteen years we have examined every house in which a case of diphtheria was reported, and among other reasons to see what connection filth and defective drainage within buildings had with the prevalence of this disease, but with such negative results as to warrant the belief that it is scarcely, if at all, more likely to occur in the poorly constructed and badly kept houses than in the best. The percentage of defects found in connection with cases of diphtheria is found to be but slightly greater than that found when examining from house to house where no disease or complaint has occurred.

In 1882 we made an investigation to ascertain what connection there might be between cases or groups of cases of diphtheria and street gullies, perforated sewer covers, sewer outfalls, proximity to tide-water flats, low, damp ground, and high ground. Here again, we found not even a suspicion of relation between cases of diphtheria and any of the suspected causes. On the other hand, we are continually reminded of the unmistakable, direct or indirect, connections between new cases of these diseases and other infected persons or rooms and articles which have become infected. We are forced to believe that the means by which children afflicted with diphtheria may and do create foci of infection in our school buildings as well as in their homes, and the facilities by which others may take on the infection from such foci, are both natural and easy. I think we are warranted in this belief by every process of reasoning and upon the facts connected with the disease. Diphtheria is unquestionably an infectious disease and may be communicated directly from person to person, or indirectly through some intermediate object upon which the infective matter may have been lodged and where it may remain active for a longer or shorter time. The local manifestation of diphtheria is nearly always in the throat, where we have the bacilli of the disease in abundance, mixed with the secretions of the throat and mouth, and in the most convenient form to be transferred to any surrounding object. This infective matter is easily scattered and attached to things by coughing, sneezing, and spitting, or by the fingers, which perform a continual messenger service between the mouth and whatever may be touched within the reach of such fingers. We have, for instance,

[1] Read at the annual meeting of the Massachusetts Medical Society, June 9, 1897.

Digitized by Google

a child suffering from diphtheria in school, not ill enough to attract special attention. He may be there a day or two before the disease is discovered, with a mild, unrecognized case, or he may be there for a much longer time in a condition for spreading the disease. During this time he may attach the infective matter to the desk, chair, books, slates, slate pencil, lead pencil, penholder, sponge, drinking cup, door knob, door, window sill, banister, wainscoting, or to anything else which he may handle or touch after using his fingers about the mouth. The fact that these things may become infected with diphtheria in this way has been conclusively shown in the laboratory by Professor Ernst.

In kindergarten schools the danger of spreading the disease by a single case is much greater, both by direct and indirect infection, because these children by virtue of the different processes of teaching are brought into much closer contact with each other and they use a large number of objects in common which are very liable to become infected. One unrecognized case under such circumstances may give rise to a dozen more, and without our being able to trace one of them to its particular source.

The following account of a kindergarten teacher may be of interest at this point:

"Regarding the contact of children with each other in kindergarten and the interchangeable use of material, it is as follows: The chairs for seating the children are small, portable ones. These are carried from one place to another as the classes need them; no one chair is allotted to any particular child; all are used in common. The tables at which the children sit are long enough for four or five children to sit at each. It is impossible to arrange so that each child may have the same chair or the same place at the table regularly. The material used is such that it is almost impossible to let one child use any portion of it solely as his. We have but two dozen worsted balls with which to teach color, form, and direction; and we have 70 children to use the ball. It is the same with everything else. The blocks used are handled by two or three classes during the same day. The iron rings, wooden sticks, wooden planes, pasteboard tablets, wooden beads, weaving needles, and worsted needles are all used in common. The napkins used at lunch time are washed once a week, and taken out before then if really soiled, otherwise they are folded and returned to the drawer ready for the next day. The picture books are enjoyed by all and the dolls are used at every recess. In playing the games the children stand holding hands on the ring, and when there is good attendance they are crowded.

"Many of the games bring them very close together, for instance:

"In playing the 'bird's nest,' the mother bird chooses six or more children, who kneel upon the floor in a semicircle; she twines their arms about each other to imitate weaving the nest. She then chooses three children, who are put close together, necessarily, in the nest, and then the game proceeds. This is a typical bird game, and is very pretty; but in time of epidemic of throat diseases, we do not like to play it in our kindergarten, as it brings the heads so near each other. There are other games, of course, which do not need such close proximity as the one described; but all the games are for two or more children to take part in, and they are generally in contact in some way, if only holding hands."

Numerous instances have come under our observation where a child has been found in school suffering from an infectious disease, by the medical inspector of schools, and sent home. This case has been followed in due time by other cases in children whose only discoverable exposure was that which occurred in the schoolroom. * * *

The board of health divided the city into 50 districts, giving an average of about 4 schoolhouses and 1,400 pupils to each district. No difficulty was experienced in finding well-qualified and discreet physicians who would undertake the duties prescribed, and the board secured and appointed one physician for each district, with a salary of $200 a year.

In the examination of the children in school every facility is extended to the doctor by the teachers, and he in turn reaches a satisfactory conclusion with the least possible delay or annoyance to anyone. There being frequent need for looking into the children's throats, we provided the inspectors with something for a tongue depressor which could be used once and destroyed, and thus get rid of the danger of communicating any disease from one pupil to another and avoid unfavorable criticism on that score. These little pieces of clean pine are made for us at a cost of one-tenth of a cent each. They are without objection in use or appearance and will burn as easily as a match, which is the intended destiny of each after being used once. The thermometer is rarely a necessity in these examinations and when used is treated with due care. * * *

The corps of inspectors has become an organized association, which meets once in two months to discuss the manifold medical questions which arise in the performance of their duties.

MEDICAL INSPECTION OF SCHOOLS.[1]

[By Miss DORA KEEN, chairman of the committee on medical inspection of schools of the Public Education Association of Philadelphia.]

The influence of schools upon the spread of contagious diseases and the need for the exercise of greater public care over the schools are subjects that may well interest members of health boards, pledged to secure the greatest good of the greatest number in questions of public safety, or teachers in training for intelligent work under accepted conditions.

In October, 1896, Dr. Charles F. Roberts, sanitary superintendent of the New York Board of Health, sent a communication to the board setting forth his belief that the greatest source of the transmission of infectious and contagious diseases among children was through contact with one another at school, and that this transmission could best be overcome by systematic daily examination of the school children by medical inspectors of the health department. * * *

While the inauguration of the work comes properly within the function of the city boards of health, with whom it lies to organize and conduct the work, yet no less does it claim the interest of the physicians and teachers.

To assure themselves of the value and necessity of the system, the boards of health of New York and Boston conducted preliminary investigations. The Boston board published tables, arranged by months, of all the cases of diphtheria in the city reported in nineteen years. There was a variation of 1,600 cases reported in any two months, and the smallest numbers were during the summer vacations. The total for the nineteen years was 3,339 cases in January, the highest number, as opposed to 1,765 cases in August, the lowest. Similar scarlet-fever records for twenty years showed 3,107 cases for January, the highest number, as compared with 1,208 cases for August, the lowest. Although recommended by the board in 1890, it was not, however, until a severe epidemic of diphtheria in 1894 that the innovation was made. An example of the effective protection of the community by the plan was afforded by an epidemic of diphtheria in 1897. A primary school of 40 pupils had 14 of its number attacked with diphtheria in eighteen days, all from one room. Of the 14 cases 7 were discovered by a medical school inspector and 3 of these only by cultures. All suspicious cases were dismissed from school May 5, and recommended to the care of their family physicians. The next morning every child was examined and many cultures taken. The class was then dismissed from Thursday to the following Monday and the rooms disinfected and cleaned. For ten days after his return the throat of every pupil was examined by the medical inspector when the children first assembled in the morning, and no pupil who had been absent with any suspicious symptoms was allowed to return until it was proved by a negative culture that there could be no danger. As a result of these measures not a single case of diphtheria resulted beyond those known to have been infected at the time the epidemic was discovered. Similar experience with scarlet fever occurred within two weeks in the service of the same school inspector, in which 11 cases resulted from the presence in school of one pupil, and his illness had been attributed to German measles.

The preliminary investigation in New York was made as a result of the above-mentioned communication of the sanitary superintendent, in order to obtain definite data as a basis for action. The best results were obtained by securing the absence list of a class in which a case of contagious disease had occurred, and visiting the absent children to learn the causes of absence. Eighty-five families with scarlet fever or diphtheria were visited, and showed 15 cases of scarlet fever and 19 cases of diphtheria, 34 cases out of 85, in which the first case in the family was a school child. It was in the district reporting the largest number of scarlet-fever cases that the connection with the schools was best marked. The examiner reported that in his experience any severe outbreak had always come from schools. The statistics seemed to show that many cases of diphtheria went unnoticed, and the same was true, to a lesser extent, of scarlet fever. Children sent home by teachers for "sore throat" frequently fail to call in a physician and return to school when feeling well. A statement of all known cases of scarlet fever in one school one fall shows that 13 cases out of the 20 would probably have remained unknown if the absence list had not been investigated. Of these 13 cases 4 did return to school, and although in a condition to spread contagion, would have remained if they had not been found. Several others were preparing to return, and the epidemic would certainly have been indefinitely prolonged in the absence of systematic investigation. In regard to measles, 17 cases reported in three weeks, in one district, were investigated, with the result that 20 additional cases were

[1] From Public Health, August, 1898.

Digitized by Google

found which, from ignorance or the mildness of the attack, had not been reported, 9 never having called a physician. Of these 37 cases, 22 had been contracted in schools. Of 13 of these same cases contracted in a parochial school, but 3 were known to those in charge.

The evidence set forth in this preliminary investigation proved so entirely convincing that application was made for the appointment of one chief medical inspector and a staff of 150, to serve during the school term each year. * * * In Chicago so much benefit resulted from the first attempt at supervision that the health department determined "to continue the work to the full extent of its resources." For lack of appropriations for a special item the work was undertaken by the regular medical inspectors, and based on the notifications from physicians of cases of infection. If the patient had been attending school, the school was at once visited, precautionary measures taken against the spread of the disease, and insanitary conditions remedied. During four months 350 individual inspections of 233 public schools were made, with the result that 1,417 cases of diphtheria and 306 cases of scarlet fever were located. * * *

On the side of defective sight and hearing preliminary and uncoordinated tests are all that can be reported. The field is an important one, and has received much attention from specialists, but no city has yet coordinated this work with that of general medical inspection of schools.

The financial basis of medical inspection of schools must be thought of. Where expense prevents a complete investigation, the work may best be begun in the kindergartens and the primary grades. This plan will include practically all the children under 10 years of age, and it is among these that the chief danger exists. This principle applies especially to the kindergarten, in which by virtue of different processes children are brought into close contact with each other, and use, in common, a large number of objects liable to become infected.

Coming next to the sanitary and hygienic side of the subject, the control that will be obtained over contagious diseases will redound to the credit of health boards and repay the community for all that the inspection may cost. It has been estimated by one physician that 70 per cent of epidemics might be prevented by school inspection. There are many diseases undoubtedly contagious upon which the law requires no report, namely, the four diseases that inspection has thus far shown to include the largest numbers of school cases—parasitic diseases of the head, contagious eye diseases, follicular tonsilitis, and oral and respiratory diseases; and, further, measles, consumption, mumps, whooping cough, rubella, and chicken pox. Medical inspection will detect a large number of cases that have not before been considered as requiring exclusion from school. While the main purpose of the health board is undoubtedly the preservation of life, yet the community has the right also to demand the best possible protection against the spread of the above-named diseases and the incident interruption of the school life of the child.

In a very large number of cases the mildness of the attack, or ignorance, has prevented the recognition and report of the disease, while the child was nevertheless in a condition to spread contagion. * * *

Chicago's experience proves that inspection should begin in the old schoolhouses, since the number of sick children from these is greater than from the new buildings. The fact points to another side for the notice of the school inspector. If the medical school inspectors are alive to the possibilities of their work, full information may be incidentally gained as to defective conditions of school life, and particular defects, from time to time, will certainly be brought to the attention of the authorities. It will suffice to enumerate the conditions to which attention should be directed. Overcrowding, defective heating, plumbing and ventilation, dark basements, insufficient and uncleanly sanitaries, seating and school furniture, recess periods, overstudy, and grading of pupils. The medical profession, quite generally through the journals, have suggested or indorsed the movement for school inspection, and, wherever established, the boards of education have cooperated in the work. After two and one-half years of test, Boston reported the plan constantly growing in favor with the medical profession, among the school teachers, and in the community at large. When organizing the work, the New York board of health took the wise step of giving a few explanatory lectures to the school inspectors. It is hoped that a movement to institute the work throughout our State may result from this presentation of its proven value.

DISCUSSION.

Dr. W. W. Keen, Philadelphia, said the State owes two duties to its children. The first one an education; and in order to obtain this, we all know that the State has passed a new law—compulsory attendance at school. The second duty of the

Digitized by Google

State to its children is a preservation of their health, and yet at the present time, owing to the compulsory education law and the absence of any law for medical inspection, we compel our children to go directly into the midst of danger to their health. You all know very well that at the seaside hotel or boarding house, if a case of scarlet fever or diphtheria breaks out, you find the place deserted in from twenty-four to forty-eight hours unless the child is taken away; and yet right in the midst of our schools a case of scarlet fever may exist or a case of diphtheria break out, and all of the children in the school are exposed to it, just as though it were a healthy child. Now, this is not right, and this practice ought not to be, when it bears so severely on the poor, or those who are either unable or do not know enough to obtain medical aid. Being in a rich or well-to-do family, when the child shows symptoms of sore throat (typical disease, and most dangerous to our school children), instantly a physician is called and the child kept from school, in order to nurse it at home. But in a poor family, very possibly the woman going out to do washing from day to day, it is impossible for her to take care of the child at home. In addition, she does not call a physician. The child is sent to school. The others are not protected; hence this child spreads the disease to all with whom it comes in contact. We must not forget, in connection with this, the fact that it is not the severe cases that are dangerous; they are so sick they must stay at home, but it is the simple cases that are the cause of severe ones very often. A mild case in one child may give another child a severe attack of diphtheria; a mild case of scarlet fever in one child may give your child a fatal attack of the disease. Therefore it is that this medical inspection of schools, the finding of mild cases each day going to school who ought not to go, is saving an enormous number of very likely severe cases, as well as many mild ones. Moreover, a great many of these cases are not made compulsory of notification. We can not have every case of measles, chicken pox, infected heads, and so on, reported. That is impossible. Yet these children go to school and infect others; and, taking measles (a mild disease) as an illustration, very many of us, I believe, in different communities do not regard it as particularly dangerous, and yet the records are very large regarding mortality as a result of measles. Next to all those oral and respiratory contagious diseases come diseases of the eye, where the secretion likely goes on the handkerchief and then to books, desks, etc. They are touched by the healthy children, who, placing their fingers in their eyes, are infected from the first child. The records of our blind asylums show that the blindness of a great majority of the children that are filling these establishments has resulted from disease. We must remember, therefore, that these cases of nonreported diseases are as dangerous as reportable ones. You may possibly have noticed the large number of children that were examined in New York and found ill. Out of 9,000 cases that were examined, some 1,200 were sick enough to be sent home—too ill to be at school; and, what is still more striking, in Chicago 744 cases of diphtheria in school led to the discovery of 26 cases in homes—cases that had not had any physicians called to them, therefore were not reported to a board of health. To these two instances I shall add a third, namely, that 231 cases of scarlet fever in school were discovered, not by physicians at home, not by careful mothers who could see that their children were ill, but 231 cases allowed to go to school were sent home by the physicians in attendance, the medical inspectors of the schools; and then, notifying the health board where these children lived, resulted in discovering 745 cases at home. I venture to think that the very facts that I have stated, from the sanitary point of view, are a justification of the necessity of compulsory medical examination of school children, lest they become a nuisance in the community in the technical sense.

Dr. S. S. Risley, of Philadelphia, said the systematic medical inspection of our schools, not only as regards the hygiene of the schoolhouse, but the examination of the individual pupils for the purpose of excluding contagious diseases and infections, must commend itself to the judgment of every thoughtful citizen of our great Commonwealth.

ILLS CHARGEABLE TO SCHOOL ATTENDANCE.

[Dr. S. H. DURGIN, Boston, Mass., before Boston Society for Medical Improvement.]

To find these diseases at home in the family of the pupil, whether contagious in character or unpleasant to the sight, is looked upon with comparative indifference by the public; but when they are found in the public schools or in any other place where the public or private rights of other parties are concerned, then the laws which deny one the right to use his own or the public place to the injury of his neighbor must be invoked. We have now 71,495 pupils and about 1,500 teachers in our public schools and 11,808 in the parochial schools of Boston. It is fair to

Digitized by Google

say that under the stimulus of this daily medical attention every teacher will become more and more expert and desirous to detect any existing illness among the children under his or her charge. Every parent can feel that his child is less exposed to disease in school and less likely to be ill without immediate and proper attention from teacher and physician than at any previous time. I am satisfied that it would be hard to find a field for medical inspection and supervision which presents equal facilities for detecting diseases among congregated bodies or which offers more encouraging results.

In looking over the list of diseases which we have found among the children attending our schools, one is forced to notice several ills which may not only be induced, but aggravated and perpetuated, by the present faulty means of seating children, a subject which has recently engaged our attention with very hopeful results. But that which strikes one more forcibly is the excessive prevalence of diseases in the throat, lungs, and air passages. We find, of the 9,188 children found to be sick, no less than 5,689 had acute or chronic diseases thus located; and of these, 5,053 were located in the throat. I would not overlook the many faulty conditions of the homes of the school children or the many outside influences which contribute to the causes of these ills; but we are painfully aware of the fact that in many of our schoolhouses there are such grave deficiencies in ventilation, heating, and cleanliness, with the attendant excessive heat or cold or sudden alternations from one to the other, that we are warranted in concluding that a proportion, at least, of this illness is chargeable to school attendance. The very large number of cases of tonsilitis, pharyngitis, laryngitis, and sore throat found gives rise to a strong suspicion, especially in view of our recent work in culture diagnosis, that if cultures had been made in all these cases many of them would have been found to be accompanied by diphtheria bacilli.

MEDICAL INSPECTION OF SCHOOLS IN BERLIN.[1]

The municipal authorities of Berlin have decided to appoint medical officers to the municipal schools. This step will certainly meet with the general approval of the medical profession, which has for a long time past recommended medical supervision of schools. According to the instructions drawn up by the municipal school board, the duties of these medical officers will be as follows: (1) They will examine children as to their state of health before they enter a school; (2) in cases of bodily or mental abnormalities they may recommend the adoption of special instructions; (3) they will have to look after children who are absent from school without sufficient reasons; (4) they will have to advise the head master in cases of infectious diseases; (5) they must give notice to the school board when they have found the health of the children unfavorably affected by the unhygienic conditions of a school; (6) they will have to be present at a certain hour at the school once a fortnight, so that the master may obtain their advice in individual cases; (7) they will have to control the class rooms without reference to the hours of instruction; (8) all the medical officers of schools will have to meet regularly under the presidency of a member of the school board to discuss matters relative to the hygienic conditions of schools, etc. The duties of these medical officers will thus be rather complex, and a good deal of tact will be required on the part of these gentlemen to avoid friction with the teachers, or with the family medical attendants of the children. A large proportion of school managers and teachers are opposed to the appointment of these medical officers, because they are anxious that their own authority shall be supreme in everything that belongs to the schools, and they are of opinion that the medical men may eventually undermine discipline. These apprehensions, however, seem to be unfounded, for a similar system has given satisfactory results in other towns, for instance, in Wiesbaden.

MEDICAL INSPECTION OF SCHOOL CHILDREN.

[By SEVERANCE BURRAGE, instructor in sanitary science, Purdue University, Indiana.]

No one more than the superintendent or teacher realizes what a glorious place the public school is for the spread of contagious disease. School epidemics are quite common; and yet it can not be denied that, in most cases, if ordinary precautions are taken, these epidemics, as such, can be prevented. It is not often that the teacher is at fault, however. It is through ignorance and carelessness of the parents, and because of insufficient sanitary regulations on the part of the public authorities, that the epidemics prevail.

[1] London Lancet, November 19, 1898. Taken from Journal American Medical Association, December 31, 1898.

Digitized by Google

An epidemic may originate either from within the school, directly or indirectly from some sanitary defect about the building, or from without the school through the agency of infected children or teachers.

When an epidemic has broken out, extraordinary or heroic measures are necessarily taken to check its spread and to prevent its future outbreak. If the trouble is in the sanitary condition of the building itself, the school may have to be closed for repairs or renovation. If it is brought in by the pupils, a most careful isolation, quarantine, and fumigation, with perhaps a temporary closing of the school, may be necessary.

But, looking at the subject from the standpoint of the sanitarian, it is our great desire to prevent the diseases altogether, particularly in epidemic form. This being the object, we must observe a number of ordinary precautionary measures continuously, such as a regular sanitary inspection of the building, resulting in the proper cleansing and airing before the beginning of the school year, and the subsequent cleaning, and, perhaps, fumigation at regular intervals; providing the scholars with a pure water supply, and distributing the same in a safe and proper manner; maintaining good sanitary arrangements; keeping the amount of floating dust and dirt down to the minimum, perhaps by the use of some form of "dustless" oil on the floors; and, in short—assuming, of course, that the school building is properly constructed, ventilated, heated, and hygienically furnished—every precaution should be taken to keep the children in that vigorous and healthy condition in which they are least susceptible to disease of any kind.

But more immediately effective than any of the above precautionary measures is the medical inspection of the school children. While only practiced by a very few of our larger cities, it has worked so well there that we can no longer regard it as an experiment.

The aims of the system are, first, to discover cases of contagious disease at the schoolroom, and to send such cases to their homes before they have done mischief; and second, to obtain better isolation by keeping these cases at home as long as the period of possible infection lasts. * * *

It is a comparatively simple matter for the teacher to recognize an "ailing" pupil, one who does not appear as bright and responsive as usual, and the process of reporting such cases to the master can occupy but a few moments at most. It would seem, after conversing with several of the Boston teachers, that they found but little objection to the system on account of the time it required of them, and they did not hesitate heartily to commend it. They did say—and of course we would naturally expect—that very much depends on the personality, the disposition, and the tact of the medical inspector. On the other hand, some parents have taken the stand that boards of health have no business to prevent these children's diseases in this or any other way; that they wish their children to have the measles, scarlet fever, etc., while young, and thus have it over with. But taking into account the very great difference in degree with which different children are affected, and the serious results which commonly follow many of these diseases, such as deafness and blindness, to say nothing of those cases which result fatally, I feel that the authorities are justified in taking this and every other possible precaution to prevent their spread in our schools. I can see no reason within the bounds of common sense, for commending such a stand on the part of the parents. * * *

During the school year 1896-97, in Chicago, even with their small force, 1,181 visits were made to the schools; 4,023 cases of contagious and infective diseases were located and taken charge of for preventive purposes, and insanitary conditions in 63 public schools were reported to the board of education, and similar conditions remedied in 53 homes of patients.

In the first three months, in New York, 63,812 children were examined, and over 6 per cent were excluded because of contagious disease. * * *

There is absolutely no reason why its introduction should be confined to large cities. The fact of the matter is that it would be very much easier to introduce, and much cheaper to operate, in smaller cities and even in towns, and as a system it would be just as effective.

As to the expense of the system, it seems to me slight in comparison with the enormous benefits that result from it. If railroad companies find it economical to spend thousands of dollars for the analysis and supervision of the water supplies of their employees, believing that they can get more and better work from healthy workmen, why should not towns and cities get much better educational results from healthy teachers and scholars, which they almost insure by spending some money for sanitary improvements and medical inspection?

It is impossible to estimate the extent of prevention which has already resulted from this system; but the figures cited above, particularly the specific infectious

Digitized by Google

diseases which were eliminated at once from the schools and placed under proper care, supervision, and isolation, give us an idea, at least, of the great value to the school and to the community. Take alone the 73 cases of diphtheria which were sent home the first year in Boston—we can simply ask the question, How many more cases did this early separation prevent?

That there has been a demand for something of this sort abroad is shown from the following extracts from the Berlin letter to the Medical Record of date January 22, 1898:

Public meetings were held at Berlin after a serious epidemic of measles, in which three-fourths of the scholars of the local academy suffered because the school was not closed. These meetings resulted in the passing of resolutions as follows: "Laymen and physicians demand that each school have a physician assigned to it, to have charge of the general hygiene of the building and be watchful over the health of scholars; to see to the proper heating, ventilation, cleanliness, and, if necessary, disinfection of the building; to order the closing of the school when the heat becomes excessive and in time of epidemic; furthermore, to examine new scholars, in short, the school physicians should protect the scholars against the dangers of school life."

Although this is not at all similar to our systems in its details, it shows that the need of something of the kind is widespread.

Besides being a most valuable preventive measure against the fostering and spreading of contagious disease, medical inspection may be looked upon as a most important factor in the education of the children and their parents on sanitary matters. Its operation also brings before the health authorities in a very emphatic manner several needed reforms and improvements, such as a sanitary inspection of school buildings and their surroundings, entirely apart from the medical inspection; the examination of the eyes and ears of the scholars, and humoring the weak ones as far as possible by seating in most favorable locations, according to their weaknesses, and the introduction of bathrooms in the schools, as so many of the children do not have access to the proper bathing facilities.

While not intending to lose sight of many of the other features of school hygiene and sanitation, nor detract from their value and importance, it is the purpose of this paper to emphasize above all this matter of medical inspection, as it is one of the greatest preventive measures so far devised. It has been highly commended by all thinking people who have seen it in active operation, especially by teachers and physicians. Realizing its importance to the health of a community, as well as its great educational value, and feeling that untold benefit can come from a more widespread introduction of it in one form or another, the writer does not hesitate to commend the matter of medical inspection as worthy of thoughtful consideration.[1]

B. A. Hinsdale said he could not assent to the view of Professor Burrage; that it would be easier to secure needed medical inspection of schools in the villages, towns, and smaller cities than in the larger cities. In the communities referred to the sentiment and practice of individualism were developed to a remarkable degree. The people were very democratic. They were not so accustomed to feel the pressure of what is called the "social whole" as the people of the larger cities, and did not so well understand it, its value, and its necessity. The communities that he referred to were not prepared to accept measures that large cities accepted as a matter of course. This fact might be the best of all reasons why the campaign of education should begin at once and be carried on with vigor, but it was certainly a conclusive reason why it should be undertaken and be conducted with prudence, tact, and wisdom.

SCHOOL DISEASES AND MEDICAL INSPECTION.

[By Prof. DELOS FALL, Albion College, Michigan.]

By the term "school diseases" is meant all such as are likely to be spread by the gathering of pupils in schools. The list is a very large one. They are probably all communicable diseases, but not all dangerous diseases. The list, however, would include only a portion of the dangerous communicable diseases to which all mankind is subject.

The common and well received tradition concerning this subject is that, in the nature of the case, school diseases, like all others, are only to be recognized and dealt with by expert medical men, acting in the capacity of medical inspectors,

[1] Proceedings of National Educational Association, 1898, p. 589.

Digitized by Google

who themselves must initiate and carry forward every movement which shall eventually rid the pupils and the schools of disease and allow them to pursue their work under improved conditions. This method makes the medical inspector the only active agent in working out the problem of restricting and preventing disease. Teachers and pupils, under this system, place themselves passively in the hands of the health officer, without themselves having any active relation to the case. This must be the case if the problem is to be solved at all from the standpoint of curative medicine, for the science of medicine remains to-day with a great deal attached to it which is vague and mysterious; that could not be taught in the schools or understood by the pupils; and all the skill of the trained physician is required to cope with the evil. Under this system it is frequently the case that the schools have to be closed, and serious interruption of their work results.

But there is a science of the prevention of disease, a science somewhat simple in its principles and so clear and manifest in its practical application that all may participate in the work and contribute to the glorious end. And this intelligent and mutual cooperation of all classes of people is the one condition by which the great work is to be done. For example, consumption is a communicable disease which destroys 150,000 of the inhabitants of the United States every year, and yet the means for its prevention and final extermination are so well understood and so simple that young children can clearly apprehend and put them into successful operation. Hence it is of much greater importance that the problem, enlarged so as to include all communicable diseases, should be studied and acted upon.

From the standpoint from which the paper is written it will not do simply to study diseases with reference to their being "school diseases;" and, again, it would fall far short of the end to be desired if medical inspection should be the one means employed for the restriction and prevention of communicable diseases.

The solution of the problem by which public schools may not be interrupted by epidemics of disease, and at the same time the health of the pupils and patrons alike be preserved from the scourges of consumption, scarlet fever, diphtheria, and other communicable diseases, will have been made when there can be secured the intelligent cooperation of pupils and teachers, patrons of the school, and all other citizens, and these aided and directed by an efficient public-health service.

I desire especially to call attention to what may be called the "Michigan idea" concerning the successful solution of this important problem. By a law of the State, enacted some four years ago, it is decreed that "there shall be taught, in every year, in every public school in Michigan, the principal modes by which each of the dangerous communicable diseases is spread, and the best methods for the restriction and prevention of each such disease." By the same law the State board of health is required annually to send to the public-school superintendents and teachers throughout the State printed data and statements which shall enable them to comply with such act. Such data have already been furnished, and other and more complete information will be given to the teachers during the coming school year.

Some reasons why it is believed that in time many of the important communicable diseases may be destroyed are:

First, the science of bacteriology has made known the specific cause of many of the dangerous communicable diseases, and this knowledge has made clear the methods by which their spread may be prevented, thus causing the saving of hundreds of lives of those who would otherwise fall victims to them.

Second, the methods by which this work is to be done are so simple that school children can easily learn them, and thus be led willingly to cooperate with their parents and health officials in the great work.

Consider for a moment what needs to be done in order that the schools may go on continuously and yet not be centers of infection from which dangerous disease shall spread. First of all, it is essential that the school and health authorities of the city be alert to the fact that the school, in the very nature of the case, is the most certain center of infection ever established in the community. Careless and ignorant parents allow their children to come to school while they are yet in a condition to communicate disease to others. The need of medical inspection of schools can be clearly seen by the study of the fact just stated, and that fact is the complete justification of municipal or school authorities, when money is expended for this purpose. When a given case is one which involves serious danger to the community, steps must be taken to see that in no way does the disease spread.[1]

MEDICAL INSPECTION A VALUABLE EDUCATIVE INSTRUMENTALITY.

[By W. B. POWELL, superintendent of schools, Washington, D. C.]

The most important argument in favor of medical inspection of schools and school children is the educational benefit it would be to the community at large. Its direct and naturally aggressive tendency would be to make knowledge of the common laws of health universal, and to create an interest in the study of social life. Intelligence respecting the effects of modes of living on length of life, on happiness of life, and on cost of living is very meager, especially among the lower classes of society. The school has reason to know and to understand the disadvantages of this condition economically and morally. Knowledge of these subjects would grow rapidly if the school would take hold of the matter purposively and would cause people to begin knowledge-getting in experience. Medical inspection would result in giving knowledge of conditions and causes, and would suggest changes in modes of living, with reasons for the same. These would cause thought and would give information to satisfy the same, which, with the purposive effort induced in the realization of suggestion, would educate in the most effectual way. This experience would create interest, which, in turn, would insure further knowledge-seeking by means of reading, attending lectures, by inquiry, and in many cases by original investigation and experiment. Is it not the duty of the school to arouse society to intelligent thought on the importance of better modes of life? By no other means can this be done so effectively. Is it not the duty of the school to train people to live better? Is not this the true purpose of the school? The logical place to begin this is with the physical life of society, the one phase of life that has been the most ignored by our educational methods, because least thought about, and until now least understood.[1]

SCHOOLS AND THE SPREAD OF DIPHTHERIA.[2]

The public health department of the London county council has issued a report upon diphtheria and elementary schools, in which Dr. Shirley F. Murphy repeats his opinion that the increase of diphtheria in London is largely due to the aggregation of children in schools. Dr. Murphy closes his report with this very grave warning:

"I am satisfied that the full recognition of the effect of compulsory school attendance in this connection is absolutely necessary if efficient measures are to be adopted for the prevention of diphtheria caused in this way. The system of notification supplies but a very inconsiderable record of the total number of persons actually suffering from the disease, its principal use being to give indications as to where inquiry should be made. The circumstance that schools contribute largely to the prevalence of this disease not only justifies but necessitates the medical officer of health having free access to schools where school children can be most readily examined for the prosecution of his inquiries. I am led to make these observations because the medical officer of health of a London district reports that the London school board has addressed to his authority a letter 'severely censuring' him for examining in school certain children during scarlet fever prevalence among the pupils of the school, where, in fact, he found children he had grounds for regarding as possibly infective. The board stated that they would not allow him or any other medical officer to examine children in their schools. The authorities in London should look to this, and would act wisely if they followed the example of New York in this respect."

THE SCHOOL A FOCUS FOR SPREADING DISEASE.[3]

The effect of schools in spreading diphtheria has long occupied the attention of sanitarians. The medical officer of the school board seems to attach little importance to this influence, but it is so natural to believe that the aggregation of many children offers full opportunity for the spread of so infectious a disease that no one can be surprised that the danger is frequently pointed out. There have been many outbreaks which have been traced to the presence of a case or two in a school, and the closing of such an infected school has often sufficed to arrest the spread.

At Southall, England, Dr. Windle suggested to the authorities systematic examination of the school children, and they accepted his advice. They had previously

[1] Proceedings National Educational Association, 1898, p. 459.
[2] New York Medical Record, December 31, 1898.
[3] London letter to New York Medical Record, October, 1898.

Digitized by Google

adopted the plan with great success in the case of scarlet fever, and there can be little doubt that the inspection which has just been carried out will serve to check diphtheria, which has prevailed for the last two years in Southall.

MEDICAL SUPERVISION OF THE SCHOOLS IN PARIS.[1]

The present institution of medical supervision of the schools in Paris does not date farther back than 1884, although previous to that year the schools were not entirely without supervision by physicians. The law of 1833 (June 28) had charged the school committees of the respective towns and cities with the care of keeping the schoolhouses clean, while a royal ordinance of 1837 (December 22) made it a special duty of the female supervisors of maternal schools (kindergartens) to watch over the health of the little children in the infant asylums.

For the city of Paris separate governmental decrees had been issued, while the two decrees mentioned had reference to all the schools of France. The decrees of 1842 (December 20) and 1843 (May 19) ordered that every public boys' and girls' school should be visited by a physician, who was to inspect the localities and the general health of the school children. For private schools and maternal schools similar regulations were issued. These school physicians of public institutions and the lady inspectors of maternal schools were appointed by the prefect of the department, selected from nominations made by the mayor.

However praiseworthy this arrangement was, it had a great drawback. In the annual budgets of the communities no provision was made for paying these physicians; hence an appeal to the generosity of the medical fraternity was necessary. Many offered their services and acted gratuitously for many years.

In January, 1878, Messrs. Lauth and Harant, members of the general council of the Seine department, moved a reorganization of the medical service in schools. Their endeavors were not without speedy success; for during the session of April 23, 1879, the council voted in favor of paying for medical supervision of the schools during the last six months of the year. The sum appropriated was 34,200 francs. New regulations issued by the prefect determined certain mooted questions and defined the duties of the physicians. The Seine department was divided into 114 medical districts, of which 88 were within the city of Paris. Each district contained between 20 and 25 schoolrooms.

The medical inspectors, who had to be graduates of well-reputed schools of medicine, were nominated by the mayors of the different arrondissements (wards) and appointed by the prefect of the department.

The term of office was three years, at an annual salary of 600 francs. They were obliged to visit the schools of their district at least twice a month, carefully inspect the localities, and remove any children found to be suffering from contagious or infectious diseases; they were even empowered to order a school closed in times of epidemics.

During the absence of the physician the principals of the schools had to watch over the health of the pupils in their respective buildings. In order to assist them in this, the authorities provided them with instructions issued by the supreme sanitary council of Paris, according to which they could detect the symptoms of contagious and infectious diseases. In Paris the medical service in school stood under the immediate supervision of the mayor of the arrondissement, while in the suburbs and the country the head of the canton watched over the faithful discharge of duty on the part of the physicians.

Up to the year 1882 the entire expense for the new institution was defrayed by the department, but in that year the communal budget of Paris contained the item of 53,000 francs for salaries of school physicians.

The experiences of the first period of three years of service had taught the authorities valuable lessons, which led to the following reforms: It was found that the number of schoolrooms (20 to 25) given to one physician to supervise was too large. The consequence was that the examination of individual children with reference to their eyesight, ears, and teeth (the seats of most children's diseases) could not be minute and exact enough. Hence the city council appointed a commission which worked out and submitted a new statute, or set of regulations; this was adopted on November 7, 1883, and went into effect January 1, 1884.

The most important points of these regulations, which are still in force, are as follows:

Article 2. The public schools of the city of Paris are, for the purpose of medical supervision, to be divided into groups of from 15 to 20 schoolrooms. Any mater-

[1] Educational News, December 6, 1890. From Freie Pädag. Blätter (Vienna), by L. Fleischner, after official French reports.

Digitized by Google

nal school is to be reckoned as two rooms. A redistricting takes place every three years. The prefect performs this duty. Newly opened schools are assigned to the nearest "medical group."

Article 3. The salary of a school physician is 800 francs ($160) per annum.

Article 4. The physicians are nominated by the mayors and appointed by the prefect of the department.

Article 5. The tenure of office of these physicians is for three years.

Article 8. Every school physician must announce to the mayor his address or residence or office and the hours at which he can be found there. This statement is posted in a conspicuous place in the respective schools. A book must be kept in every public school and maternal school, in which the school physician notes down his observations. This book must be submitted to the inspection of officials and supervisory authorities.

Article 10. The school physician is obliged to visit every public and maternal school twice a month, but he must also appear there when the mayor or prefect may see fit to order a visit.

Article 11. When visiting a schoolhouse the physician shall first thoroughly inspect the "localities" (corridors, stairs, water-closets, etc.). In so doing, the principal of the school is to accompany him, so that he may receive suggestions from the physician. Then the latter visits each class room, and after he has inspected them with reference to light, heat, ventilation, furniture, etc., he must proceed to examine the pupils separately, especially those who are pointed out by the principal and teachers as showing symptoms of indisposition. After the examination of a schoolroom and its inmates is completed, the physician enters the results in his book intended for this purpose. He answers the different questions and tabulates his answers in the columns provided for them. In the column "ad hoc" he enters the names of those children in whom he has noticed symptoms of approaching disease, states that their withdrawal from school is found necessary, and especially notes whether the disease is contagious. Finally, he enters the number of pupils absent on account of sickness on the day of his visit, and inquires of the teachers what sickness, if any, seems to be prevalent at that time.

Article 13. At least once a month a thorough examination of each child is to be made with reference to eyes, ears, and teeth. If the physician finds an inclination to disease, or if the general state of health of a child needs special attention on the part of the parents, these must be notified by the physician's certificate, which is to be handed to the child.

Article 14. Children in whom the physician discovers the symptoms of a contagious or infectious disease are to be sent home at once with a sealed letter, in which the physician states the cause of this step. In this letter the parents are notified that the child is not permitted to attend school until it comes with a certificate signed by a school physician announcing its complete recovery.

Article 15. The principal of every school keeps at hand a series of instructions, issued by the supreme sanitary council, in which the symptoms of contagious and infectious diseases are stated. If a child gets ill during the absence of the school physician, the teacher of the respective class room notifies the principal. If the latter finds symptoms of a contagious or infectious disease, he must send the child home with a sealed letter, in which he asks the parents or guardian to call at the office of the respective school physician during his office hours, which are mentioned.

Article 16. A certificate of recovery may even be required of children who have been absent for any length of time on account of sickness, without having been sent home. In this case the nature of the illness is to be stated, unless the child is subjected to a special examination by the school physician and thus acquires a certificate of recovery.

Article 18. Within twenty-four hours after each sanitary and medical inspection the physician is obliged to report to the mayor of the arrondissement (ward) about the sanitary condition of the school. Blanks for this purpose are furnished him.

Article 19. The mayors of all arrondissements prepare summaries of the various individual reports and submit to higher authority all those propositions and suggestions which seem of special importance. Propositions which are of a more general nature, and not very pressing, are referred to medical committees for deliberation and subsequent report. In case an epidemic breaks out, the mayor has the right, upon motion of the school physician, to close a school; but he is obliged to give notice of his action to the school inspector and his own superiors.

Article 20. The mayor is required to report regularly every three months to his higher authority (the prefect of the department) concerning the sanitary and medical condition of the schools in his arrondissement. Semiannually he must send in a more elaborate report, containing suggestions for changes and improve-

Digitized by Google

ments, such as are made by the physicians in their reports to him. Advice regarding changes and "adaptations" in buildings is equally welcome.

This supervision of the Paris elementary schools was, in 1886, performed by 128 physicians. The budget of the city for that year contained the sum of 100,800 francs for this institution. Medical supervision of schools in Paris has served as a model for similar arrangements in other French cities. By means of a ministerial order of November 14, 1879, the attention of all prefects was called to the instructions quoted above at length. But since then, through the school law of October 30, 1886, as well as through ministerial decrees and orders dated November 18, 1887, medical and sanitary inspection has been made obligatory for all the schools, public and private.

A few years ago the city council of Paris expressed the desire that with this institution of supervision be connected a free school dispensary. This suggestion is under advisement at present.

These dispensaries, so it is intended, shall go further than the school physicians who are watching over the health of the children. These dispensaries shall take sick children and treat them in hospital wards specially arranged for children, and provide them with medicine and surgical assistance.

As early as 1862 a few free dispensaries were in existence in Paris supported by charitable societies, notably the "Société philanthropique." These dispensaries were connected with hospitals for children, but there is a difference between institutions founded and maintained by charity and those by law. In these private dispensaries children could not always have the desirable special treatment, medicine, shower baths, etc. To the city of Havre belongs the honor and credit of having founded the first public free dispensary for children. This institution is equipped with all the most desirable conveniences and all necessary appliances. In 1875 a physician, Dr. Giebert, aided by contributions of charitable persons, established an institution of this kind which had astonishing results, and was subsequently made a city institution.

In Paris the first children's dispensary was opened in the first arrondissement upon urgent solicitation of Dr. Dubricay and M. Baudof. It found a home in Jean Lantrie street, No. 15, in a house which was offered by the owner free of charge. Since the date of opening, April 1, 1883, the consultations in this institution have reached the enormous number of 60,000. In the first year the number was 5,037, then, steadily increasing, it reached 19,000 in 1889. The expenses during 1889 were 5,980 francs, but the annual donations amounted to 8,205 francs.

The example set by the first arrondissement soon found imitators. To-day (in 1890) eight arrondissements have children's dispensaries, partly supported by private persons (like those in the thirteenth and fourteenth arondissements), partly by the city. The excellent influence these few institutions have exerted has awakened the desire of increasing their number and to provide every ward of the city with one; hence a credit of 100,000 francs was opened for that purpose in the city budget of 1890, and all indications point toward an early fulfillment of the desire mentioned above, namely, that the medical and sanitary inspection of the schools be supplemented by a great number of free dispensaries, in which children will find treatment needed in cases of sickness.

CHAPTER XXXI.

BIBLE STUDY IN AMERICAN COLLEGES.

The following report upon the condition of Bible study in the colleges of the country has been furnished to this office through the courtesy of Dr. William R. Harper, president of Chicago University.

The investigation was conducted during 1897 by a committee appointed by the Council of Seventy of the American Institute of Sacred Literature. The organization of the institute and that of the council are explained in the following paragraphs, compiled from the publications of the institute.

THE AMERICAN INSTITUTE OF SACRED LITERATURE, DIRECTED BY THE COUNCIL OF SEVENTY.

The work of the American Institute of Sacred Literature is directed and maintained by the Council of Seventy, a governing body composed of representative Biblical teachers of America, organized for the purpose of promoting the historical study of the Bible, and of improving and increasing Biblical instruction.

The experimental period of the institute has passed. Its work has become a recognized part of the world's work. The following plan has been adopted for the conduct of the Institute, along the lines already well established and in new directions not yet developed.

The chief features of the plan are (*a*) the organization of the leading active Biblical teachers of the country for a common purpose; (*b*) the constant training of new teachers in the guilds of the council, which will result in added dignity and a consequent increase of interest in Biblical teaching as a profession; (*c*) the possibility of increase in the working power of the institute through councilors and fellows in all parts of the country; (*d*) the body of patrons, who will give staunch support to the work by their money and influence.

The first annual meeting of the Council of Seventy was held in Chicago, December 9, 1896; the second, January 14, 1898; the third, March 4, 1899.

THE CONSTITUTION OF THE COUNCIL.

1. The name of the organization shall be the Council of Seventy, in full "The Council of Seventy of the American Institute of Sacred Literature."

2. The purpose of the council shall be (1) to associate more closely those who desire to promote the study of the Bible from the historical standpoint, and of other sacred literatures as related to it; (2) to induce properly qualified persons to undertake this work either independently or in connection with another calling; (3) to extend through the American Institute of Sacred Literature a wider acquaintance with the right methods of Bible study and their results; (4) to direct the affairs of said institute.

3. The council shall consist of persons who, believing that the critical need of the times is teachers of the Bible properly trained and imbued with the historical spirit, (*a*) having secured a thorough knowledge of a particular portion of the Bible or of other sacred literatures as related to it, and (*b*) having prepared themselves to teach the same, (1) shall by the acceptance of membership in the council pledge themselves to accept such opportunities as may present themselves to communicate to others the results of their work in Bible study, and (2) thus express themselves as willing to accept the appointments of the American Institute of Sacred Literature in so far as such appointments do not interfere with other obligations which they have assumed.

4. The number of members in the council shall be limited to 70, and the councilors shall be divided into three chambers according as their work pertains to the Old Testament, the New Testament, or sacred literatures in general. No chamber

Digitized by Google

shall contain more than 23 members, exclusive of the president of the council, who shall be reckoned as a member of each chamber.

5. The officers of the Council of Seventy shall be a president; a principal of the institute; a recorder, who shall keep the records and edit the reports of the council; a treasurer, who shall also be the treasurer of the institute; three trustees, who shall have general charge of the funds of the council and who shall be elected by the council from among the patrons; and a master and a scribe for each chamber. These thirteen shall constitute the senate of the council, to whom shall be committed the management of the affairs of the council in the intervals of its meetings and the detailed management of the institute, which shall include the arrangement of courses of instruction, the organization of aggressive work, the selection and appointment of instructors. The president shall be elected by a separate ballot of each chamber and a majority of the votes of each of the three chambers shall be necessary to an election. The recorder and treasurer shall be elected by a majority of the votes of the three chambers, and the master and scribe by a majority of the votes of the chamber concerned. Friends of the work who may consent to render aid in furthering the purposes of the council shall be denominated patrons, and their names published as such in the documents of the council.

6. One-fourth of the council shall constitute a quorum, provided each chamber is represented. One-third of each chamber shall constitute a quorum. One-half of the senate shall constitute a quorum.

7. New councilors shall be elected by the respective chambers, subject to confirmation by the senate. The rank of councilors in each chamber shall be determined in each case by academic seniority.

8. The council shall hold an annual meeting in the month of December at such time and place as may be determined. At this meeting (1) the annual report of the president and principal shall be presented; (2) an election of officers shall take place; (3) separate meetings of the chambers shall be held for the discussion of special questions.

9. Each councilor shall be authorized to organize a guild of those of his pupils or others (*a*) who have shown sufficient advancement in Biblical work and interest in the purpose of the council to warrant such appointment; (*b*) who will undertake to give earnest attention to the securing of a thorough knowledge of a particular portion of the Bible or other sacred literature; (*c*) who will make every effort to prepare themselves to teach the same to others; (*d*) who will hold themselves in readiness to accept the appointments of the Institute of Sacred Literature so far as such appointments do not interfere with other obligations which they may have assumed. All appointments to a guild shall be made annually and shall be confirmed at the annual meeting by the chamber of which the councilor is a member. Members of the guilds shall (1) be called fellows of the council; (2) report, through their councilors, to the chamber the work of each year; and (3) pay to the treasurer the sum of $5 a year. In filling vacancies in the council preference shall be given to the fellows.

10. The council shall undertake the publication of such pamphlets and documents as may be needed for the work of the institute.

11. A record of the work of each councilor and of each fellow shall be preserved. This record shall be printed annually and sent to each councilor and fellow.

12. An annual report of the work of the institute shall be prepared by the principal and shall be published for the benefit of the councilors and patrons.

The officers of the Council of Seventy for the year 1898 were: President, Dr. John H. Barrows, the University of Chicago; principal, President William R. Harper, the University of Chicago; recorder, Dr. Clyde W. Votaw, the University of Chicago; treasurer, Prof. George H. Gilbert, Chicago Theological Seminary.

The council is divided into three chambers, one having in charge the work connected with the Old Testament, another having in charge the work connected with the New Testament, and a third having in charge the work connected with sacred literatures in general. The officers of the three chambers are: Old Testament chamber: Master, Prof. Edward T. Harper, Chicago Theological Seminary; scribe, Prof. George L. Robinson, McCormick Theological Seminary. New Testament chamber: Master, Prof. Charles F. Bradley, Garrett Biblical Institute; scribe, Prof. Shailer Mathews, the University of Chicago. General chamber: Master, President Charles J. Little, Garrett Biblical Institute; scribe, Prof. George B. Foster, the University of Chicago.

The names of the members of the Council of Seventy will be found below.

The senate of the council, consisting of the 13 officers of the council, meeting monthly in Chicago, directs the work in detail through the executive officers of the institute, reporting at intervals to the general council. These executive

Digitized by Google

officers are: President William R. Harper, principal; Prof. Frank K. Sanders (Yale), eastern vice-principal; Miss G. L. Chamberlin, executive secretary.

THE WORK OF THE INSTITUTE.

Any statement in regard to the work of the American Institute of Sacred Literature should be prefaced by a clear definition of the aim of the organization, viz, to stand for no special theory of interpretation, school of criticism, or denomination, but to promote a systematic knowledge of the Bible as interpreted in the best light of to-day, and to increase the facilities for obtaining such knowledge.

It works in harmony with all Christian denominations. It joins hands with all organizations for Christian work.

Specifically, the divisions and subdivisions of the institute work are as follows:

I. The correspondence work.—In this department courses are offered:

1. In the Hebrew and Cognate languages: (*a*) For beginners; (*b*) for reviewers; (*c*) for advanced students.

2. In New Testament Greek: (*a*) For beginners; (*b*) for reviewers; (*c*) for advanced students.

3. In the English Bible: (*a*) Book study, e. g., Luke, John, etc.; (*b*) subject study, e. g., the founding of the Christian church, etc.

The correspondence instruction is given by men of university and theological training. It is conducted by means of printed instruction sheets sent to the student weekly. The recitations, written out in accordance with the instructions, are returned to the instructor, examined and criticised by him, and again returned to the student with further suggestions. Since 1878, the year in which the correspondence school of Hebrew was organized, about 1,000 persons have received instruction in the department. A large proportion of these have completed courses and received certificates. The work has not been confined to America and Great Britain, but has been carried among Christain missionaries into every part of the world, Australia, Africa, and China adding not a few names to the roll.

II. Reading work.—1. The Bible Students' Reading Guild: This Guild aims to provide reading courses, both popular and professional, upon Biblical and theological topics. At present only the professional courses are available, but the number of these will be made to meet the demand. The courses cover such subjects as the following:

(1) Historical and literary origin of the Pentateuch; (2) Old Testament prophecy; (3) The origin and growth of the Hebrew psalter; (4) The life of the Christ; (5) The apostolic age; (6) The problems of the Fourth Gospel; (7) Christianity and social problems; (8) The preparation of sermons.

The books upon these courses (six or more in number) are selected by the Council of Seventy, and are intended to present impartially all sides of the subject. The Biblical World or the American Journal of Theology, according to choice, is sent to each member for one year from date of registration. In order that the courses may be available to the largest possible number of ministers and Bible teachers, the books are loaned as well as sold. A carefully prepared review accompanies each volume.

The details of this scheme give to the professional Bible student an opportunity (1) to secure a consensus of opinion upon the most important literature on the subjects connected with his work; (2) to obtain temporarily the use of books thus wisely selected; (3) to build up his own library under most competent advisers; (4) to have at hand in his reading a carefully prepared review which he may annotate and keep for future reference; (5) to keep in touch with the best current thought in periodicals, both American and foreign; (6) to secure advice along lines of special reading not in the courses announced; (7) to do all this at a very small annual expense.

Arrangements for special credit for work are made with individual students when desired.

2. The Outline Bible Club course for Christian organizations: The urgent necessity for a course of study for young people and for all Christian organizations, a legitimate feature of whose work might be Bible study, renders advisable a special course upon which all organizations may unite and thereby avoid a confusing complication of work, and duplication of membership. The course presents four subjects, viz, The life of the Christ, The foreshadowings of the Christ, The founding of the Christian church, The work of the Old Testament sages. Each year is independent, and students enter at any time with the then current year.

Since it is a study course, and not a reading course, only the Bible is used. The work is conducted by means of monthly direction and question sheets sent to all students, in which daily work is assigned. The work is inductive; the student is

Digitized by Google

led to investigate the original sources, and is given information only when it seems necessary. The time required in the work of this division is fifteen minutes a day. It is, therefore, especially suited to busy Christian workers. Five thousand persons have enrolled for this course during the past year, among them members of the Young People's Society of Christian Endeavor, the King's Sons and King's Daughters, the Young Men's Christian Association, and the Young Women's Christian Association, the Women's Christian Temperance Union, the St. Andrew's Brotherhood, the Epworth League, and other similar organizations. The course is personally recommended by the heads of these organizations.

III. Examination work.—In order to stimulate such study of the Bible as is not carried on directly in connection with the institute, certain annual examinations are offered as follows:

1. An examination in connection with the International Sunday School Lessons. (This is sometimes omitted.)

2. To undergraduate college students in (*a*) Hebrew; (*b*) New Testament Greek; (*c*) a specific Biblical subject (English).

For the best two papers in each of the college examinations prizes of $100 and $50, respectively, are offered.

IV. Summer schools.—The summer schools of the institute are usually held in connection with other institutions or organizations, the number of courses and the character of the work depending upon the desire and financial resources of each institution or organization. Instruction has been given under the auspices of the institute in connection with the University of Chicago; the Chautauqua Assemblies at Chautauqua, N. Y.; Bay View, Mich.; Des Moines, Iowa; Lake Madison, S. Dak.; Lakeside, Ohio; Monteagle, Tenn.; Winona, Ind.; Saratoga, N. Y.; Winfield, Kans.; Glen Park, Colo.; Pertle Springs, Mo.; Ruston, La.; Waseca, Minn.; Marinette, Wis.; Silver Lake, N. Y.; Tully Lake, N. Y.; Crete, Nebr.; also under different auspices at Macatawa Park, Mich.; Jackson, Tenn.; Lewiston, Me. Not less than 5,000 students receive a longer or shorter term of instruction each summer.

It is the purpose of the institute to organize independent summer schools, where it seems wise to do so.

V. Lecture work.—Biblical lectures are given under the auspices of the institute (*a*) in courses, in cooperation with university extension organizations; (*b*) in courses, in colleges and local institutes; (*c*) as single lectures and addresses at conventions and elsewhere.

VI. Local board work.—Local boards of the institute, whose duty it is to propagate the work of the institute in their respective localities, are organized in several of the larger cities.

VII. Publication work.—The institute publishes all its own instruction sheets. Outline inductive studies, supplemental to the International Sunday School Lessons, have been furnished to the Sunday School Times for five years. Series of studies are also provided for other periodicals. It is the province of this department to provide supplementary material for the reading courses when necessary.

MEMBERS OF THE COUNCIL OF SEVENTY.

OLD TESTAMENT CHAMBER.

Prof. W. J. Beecher, Auburn Theological Seminary, Auburn, N. Y.
Prof. W. R. Betteridge, Rochester Theological Seminary, Rochester, N. Y.
Prof. C. R. Brown, Newton Theological Institution, Newton Center, Mass.

REPORT OF THE COMMITTEE APPOINTED BY THE COUNCIL OF SEVENTY OF THE AMERICAN INSTITUTE OF SACRED LITERATURE TO INVESTIGATE THE CONDITION OF BIBLE STUDY IN AMERICAN COLLEGES.[1]

Your committee beg leave to submit the following report of the condition of Bible study in the colleges of the country, as they have studied it in pursuance of orders received.

OWEN H. GATES,
Oberlin Theological Seminary, Oberlin, Ohio.
WILLIS J. BEECHER,
Auburn Theological Seminary, Auburn, N. Y.
CHARLES F. BRADLEY,
Garrett Biblical Institute, Evanston, Ill.
EDWARD T. HARPER,
Chicago Theological Seminary, Chicago, Ill.
FRANK K. SANDERS,
Yale University, New Haven, Conn.

JANUARY 14, 1898.

[1] The report as published has been somewhat altered from the form in which it was read before the Council of Seventy at their annual meeting January 14, 1898, that form having had special reference to the oral presentation of the report.

Digitized by Google

ACCOUNT OF THE METHOD EMPLOYED.

A circular letter was sent to the presidents of the colleges of the country (exclusive of the Roman Catholic institutions) which are listed in the latest published report (1894–95) of the United States Commissioner of Education. The letter inclosed a list of questions to be answered and the familiar circular of the institute. The letter and list of questions are given herewith:

THE AMERICAN INSTITUTE OF SACRED LITERATURE,
Oberlin, Ohio, May 1, 1897.

DEAR SIR: At their annual meeting in December the Council of Seventy appointed a committee "to make a thorough investigation of the teaching of the Bible in American colleges, said committee to present the results of the investigation and recommendations thereupon at the next meeting of the council."

The committee ask for the cordial cooperation of the several colleges, in order that the investigation may be as thorough and the report as complete as possible. The inclosed questions are sent to you in pursuance of the task laid upon us. The formulated questions can not, of course, exactly suit each case, and we ask you to answer them as fully as possible, and in addition to give supplementary information of which, in your judgment, we ought to be in possession.

It is expected that copies of the report will be sent to each college, so that all will share the information we secure.

If there is likely to be delay in replying, kindly drop us a card, that we may know that our letter has reached the proper persons.

BIBLE STUDY IN COLLEGES.

Please send as soon as convenient to Prof. Owen H. Gates, Oberlin, Ohio, the following items:

I. The current issue of your catalogue, for the sake of general information as to your curriculum, as well as its description of your Bible courses.

II. Any other printed description of your Bible work which you may have.

III. Information on the following points, as to each of your Bible courses, as exact as possible for the purpose of tabulation, and as full as possible, in order to preclude improper inferences:

1. Name, description, length in hours per week, and total hours.

2*a*. If required, of what classes? Preparation involved for recitation and for examination. Estimate of the value to the student body of required Bible courses.

2*b*. If elective, how freely elected? Preparation involved for recitation and for examination.

3. Primary aim, devotional, culture, theological?

4. Method employed in the conduct of the course.

5. Is the instruction by a teacher (or teachers) designated wholly or chiefly for this purpose? Is the work attached to some other chair? Is it assigned according to circumstances to some suitable member of your faculty? Are the courses taught by the same teacher in successive years?

6. Any recent or proposed changes in regard to the work. We would like to note any marked tendency among the colleges.

7. Opportunities outside of the curriculum upon which you rely for instruction in the Bible; e. g., Y. M. C. A. courses, etc.

8. Additional remarks.

	Men's and coeducational.	Women's, first class.	Women's, second class.	Total.
Number of colleges addressed	422	15	146	583
Number of colleges responding	243	9	31	284

It was early seen that the conditions obtaining in the girls' schools of the second grade were so different from those in the other classes that they could not in any case be treated in connection with them; accordingly no efforts were made after the first letter to get information from them.

Digitized by Google

The report will mention the women's colleges of the first grade in a group by themselves in order to facilitate comparison among themselves.

The basis of the body of the report is therefore the 243 men's and coeducational colleges which responded to the request for information.

As is intimated above, the replies were not all sent at once in response to the first call. Supplementary letters were sent to many, and it was a puzzling question what amount of energy should be devoted to the prosecution of the inquiry. We are happy to state that in almost every case the second call brought a reply. This was in part due to the fact that we selected for a second letter the better known and more responsible colleges which had not replied at first; and in part that it involved a written and more individual letter, which is, of course, more effective than a printed circular, though sent under a sealed cover. In some cases a postal card asking for a catalogue was answered when the circular was ignored.

In order to secure the freshest possible information, the letter was not sent out until May—of course during the summer no correspondence could be carried on—and when the work was resumed in the fall it was prosecuted in the midst of other pressing duties. We decided that unless practical completeness were to be our aim, we had in the results already mentioned material enough for safe deductions. We therefore suspended the work of collection for the more difficult one of collation.

The colleges heard from constitute about 60 per cent (57½) of the Protestant colleges of the country within the group mentioned above. The enrollment of students in these reporting colleges exceeds 77 per cent of the whole enrollment in the same group. This, of course, means that we have heard from the larger colleges. The average number of students in the colleges which report is 185, while in the remainder it is only 76. The total number of students in the institutions reporting is 47,700 out of a total of about 61,700 students in the group of colleges under consideration. It is thus evident that we have quite general and satisfactory information as to the advantages afforded the students of our colleges for the study of the Bible.

Men in non-Roman Catholic colleges		44,482
Women in coeducational colleges	13,677	
Women in women's colleges	3,536	
Total women in non-Roman Catholic colleges		17,213
Total students		61,695
Men in colleges reporting		35,000
Women in coeducational colleges reporting	9,600	
Women in women's colleges reporting	3,100	
Total women in colleges reporting		12,700
Total students in colleges reporting		47,700

From the circumstances of the appointment of the committee it is fair to assume that the report will urge more and better Bible study. The institute stands for more, rather than less, Bible work. Now, it is clear that if the report errs on account of not being complete it will err in representing that the Bible study of the colleges is better than it is, for the conditions in the nonreporting colleges will be less favorable than in those which replied. * * * In other words, we have very much more than three-fourths of the amount of Bible study in the colleges represented in our report.

Further, the smaller colleges with their fewer teachers and less subdivision of labor can not furnish as good a quality of instruction as the larger institutions, so that from our studies we form none too low an estimate of the quality of Bible study in the country at large.

Digitized by Google

We therefore will not err in basing our appeals for more and better Bible study in colleges on the information which we have been able to gather in our investigation.

The following is a list of the colleges responding and included in the statistics. The data correspond with the table of colleges in the report of the Commissioner of Education for 1894–95, pages 2115 and following, except that in the last column "State" takes the place of "nonsect" in the case of the State institutions:

No.	Location.	Name of college.	Denomination.
	ALABAMA.		
3	Eastlake	Howard College	Bapt.
9	University	University of Alabama	State.
	ARIZONA.		
10	Tucson	University of Arizona	State.
	ARKANSAS.		
11	Arkadelphia	Arkadelphia Methodist College	M. E. So.
13	Batesville	Arkansas College	Presb.
14	Clarksville	Arkansas Cumberland College	Cumb. Presb.
15	Conway	Hendrix College	M. E. So.
17	Little Rock	Philander Smith College	M. E.
	CALIFORNIA.		
19	Berkeley	University of California	State.
20	Claremont	Pomona	Cong.
24	Oakland	California College	Bapt.
26	Pasadena	Throop Polytechnic Institute	Nonsect.
31	Stanford University	Leland Stanford University	Nonsect.
	COLORADO.		
34	Boulder	University of Colorado	State.
35	Colorado Springs	Colorado College	Nonsect.
36	Del Norte	Presbyterian College of the Southwest	Presb.
	CONNECTICUT.		
39	Hartford	Trinity College	P. E.
40	Middletown	Wesleyan University	M. E.
41	New Haven	Yale University	Cong.
	DELAWARE.		
42	Newark	Delaware College	Nonsect.
	DISTRICT OF COLUMBIA.		
43	Washington	Columbian University	Bapt.
44	....do	Gallaudet College	Nonsect.
47	....do	Howard University	Nonsect.
	FLORIDA.

A word should be added as regards the construction which the committee have put upon the term "Bible study" in studying the information received. The study may be done in Hebrew or Greek, or in the English Bible; but in order to be admitted into the tables it must be a regular part of the curriculum. If it is by catalogue statement required of all its students, it is included. If not required, it must be regularly elective, and account must be taken of it in some way in the requirement for graduation. We felt justified in rejecting from consideration for purposes of tabulation such statements as this: "The president conducts a voluntary Bible class Sunday mornings," when no other information is given of the work and its place in the college duties.

In order to guard against any misrepresentation in any lists which might be published, we gave the colleges an opportunity, by a special question, to state what outside means are employed in Bible instruction.

INFORMATION GATHERED.

"NO STUDY" COLLEGES.

Of the 243 listed (men's and coeducational) colleges, 46 are without Bible study. Of these, 17 are State institutions, 14 nonsectarian, and 15 denominational.

The following is a list of these 46 colleges, together with the remarks made by them by way of explaining, apologizing for, or justifying their lack of opportunities for Bible study:

9. University of Alabama.—None.

10. University of Arizona.—"Prohibited by law."

11. Arkadelphia.—Would be glad to arrange Bible study, and would appreciate information as to methods.

19. University of California.—"In State institutions distinctive Bible study is not favored, but in literary classes frequent reference is made to the literary qualities of the Bible."

26. Throop Polytechnical Institute.—From the catalogue. No other reply made; nothing appears.

53. University of Georgia.—There is a teacher of Bible outside of the faculty. It is proposed to raise an interdenominational fund.

Digitized by Google

64. University of Idaho.—Young Men's and Young Women's Christian Associations. No other course thus far.

70. University of Illinois.—The letter was referred to the Young Men's Christian Association, who conduct the only course.

85. Lincoln University.—No regular work as yet.

98. Indiana University.—No Bible work appears in the catalogue.

125. Iowa State University.—No Bible work appears in the catalogue.

152. St. John's Lutheran.—No Bible course as such in the curriculum. This institution being preparatory to a seminary, the systematic study of the Bible under the head of isagogics is entered on in that department. "We give at least two hours per week in the preparatory department to Bible history, Old and New Testament, guided by text-book; college, freshman, and sophomore years, Luther's Catechism, etc., junior and senior, Greek New Testament." The president adds: "If you publish outlines for Bible study in college, I would be glad to get a copy."

156. Ogden College.—"From lack of funds, we have not been able yet to arrange for a Bible course in the college."

175. New Orleans University.—Bible is taught in the preparatory department. A theological course is advertised, but no students are recorded in that course.

177. Tulane University.—"I shall be glad to learn of any practicable plans to promote Bible study."

179. Bates.—President Chase replies that they have Bible study. As it is explained, however, it falls in the class of extra-curriculum study. There is a required course in ethics, and there are large voluntary classes in Bible conducted by Professor Purinton, of the (Cobb) Divinity School.

181. St. Johns College.—The president teaches a Sunday Bible class.

250. Washington.—Constitution forbids instruction "either sectarian or religious, or partisan in politics," etc. Charter forbids instruction "either sectarian in religion or partisan in politics," etc. * * *

266. State University of Nevada.—"I regret to say that there is no Bible instruction in the university."

280. St. Lawrence.—The catalogue has no hint of Bible study. The religious attitude of the university is shown by required church and chapel attendance and by the fact that they have a theological department.

290. New York University.—None.

302. Catawba.—No study.

308. Fargo.—Requires it of preparatory students, but has no course in college. Number of students of college grade, 4.

309. University of North Dakota.—"Forbidden by law;" "no instruction either sectarian in religion or partisan in politics shall be allowed in any department of the university." There are simple religious exercises each day and voluntary Bible classes Sunday evenings. Attendance is gratifyingly large, including most of the Roman Catholics among the students.

311. Buchtel.—Does not report Bible study.

343. Urbana College.—Bible study seems to be completed in the preparatory department; in the college, theological instruction takes its place.

345. Wilberforce University.—None.

350. University of Oregon.—No study.

358. Western University.—None.

380. Central High School, Philadelphia (college grade).—None.

385. Pennsylvania State College (land grant).—Catalogue makes no statement. It is known that the professor of English includes a study of Job in one of his courses.

391. College of Charleston.—None. Letter gives no explanation.

413. University of Tennessee.—Catalogue shows none. There is a Young Men's Christian Association.

424. Vanderbilt.—"We have often discussed the matter, and are desirous of introducing an elective in Bible study."

425. University of the South.—None in the catalogue.

427a. Jesse Mai Aydelott.—None.

431. University of Texas.—Catalogue shows none. There is a Young Men's Christian Association.

Digitized by Google

445. University of Utah.—Catalogue shows none. There is a Young Men's Christian Association.

446. University of Vermont.—President conducts a Bible class Sundays.

447. Middlebury College.—None.

450. University of Virginia.—No official provision, but much interest on the part of some teachers and students. Professor Willett lectures.

451. Emory and Henry College.—"I desire to make Bible study, as soon as practicable, a part of the curriculum."

457. William and Mary College.—None; they rely on outside aids.

462. University of Washington.—Catalogue shows none.

476. Milton.—None.

481. Wyoming University.—All instruction in religious matters is voluntary. No Young Men's Christian Association as yet.

238. Doubtful if any.

The number of students in the colleges listed above which have no regular study of the Bible in the curriculum is a little less than 8,000. The average number in each college, 175.

Colleges (for numbers see list above) with required, elective, and no—Bible study.

STATE INSTITUTIONS AND BIBLE STUDY.

Alabama.—None.

Arizona.—Prohibited by law.

Arkansas.—No State institution reporting.

California.—"In State institutions distinctive Bible study is not favored, but in literary classes frequent reference is made to the literary qualities of the Bible."

Colorado.—Hebrew appears in the catalogue.

Connecticut.—No college.

Delaware.—No State institution reporting.

Florida.—No State institution reporting.

Georgia.—Teacher outside of faculty. Proposal is made to raise an interdenominational fund.

Idaho.—Young Men's Christian Association and Young Women's Christian Association. No other courses thus far.

Illinois.—Letter was referred to the Young Men's Christian Association, who conduct the only courses.

Indiana.—No Bible work appears in the catalogue.

Iowa.—Catalogue shows no Bible.

Kansas.—Two Greek classes use Greek Testament for sight reading. Occasionally there is a regular class in Greek Testament. The professor of English literature lectures on English Bible; Greek professor on origin of the Bible. Young Men's and Young Women's Christian Associations.

Kentucky.—No State institution reporting.

Louisiana.—Stevens and Burton's Harmony of the Gospels one hour weekly is studied. No examination. Aim, devotion and culture. Assigned to suitable teacher. Next year we want to introduce Burton's Letters and Records of the Apostolic Age. We find the course of study we are pursuing a good one.

Maine.—No State institution reporting.

Maryland.—No State institution reporting.

Massachusetts.—No State institution reporting.

Michigan.—Courses of Biblical literature in Young Men's Christian Association building through the voluntary agency of the Church of the Disciples, who have established chairs here for that purpose, and have done a great deal of good here for the last few years. "Students (I think) pay a small fee." Endowment courses of lectures have also been established by an Episcopal guild and also by a Methodist guild. Catalogue shows several Hebrew and Hellenistic Greek courses.

Minnesota.—Hebrew and history of the Hebrews.

Mississippi.—No information.

Missouri.—New Testament Greek. Disciple Bible college in connection. Work there is not counted on a degree. Episcopal guild to be established. This idea is gaining ground in Missouri. The president of the Bible college writes that credit is given for time spent in that college. This has 100 university students (50 from the law department) taking two to four hours of work in the Bible college.

Montana.—No State institution reporting.

Nebraska.—New Testament Greek; Old Testament literature. Interpretative study of Old Testament poetry and characterization, one semester. Led by English literature teacher.

Nevada.—"I regret to say that there is no Bible instruction in the university."

New Hampshire.—No State institution reporting.

New Jersey.—No State institution reporting.

New Mexico.—No State institution reporting.

New York.—No State institution reporting.

North Carolina.—Catalogue statement: New Testament Greek, two hours per week. Literary study of the Bible. For graduates, critical survey of one or more books. Influence of the Bible on literature and development, by professor of English: not given every year. The professor of history lectures on New Testament history to the Young Men's Christian Association. This can not be counted toward a degree.

North Dakota.—"Forbidden by law." "No instruction either sectarian in religion or partisan in politics shall be allowed in any department of the university."

Digitized by Google

Ohio.—No information.

Oklahoma.—No information.

Oregon.—No study.

Pennsylvania.—Elective (1897-98) to juniors and seniors, by Dr. T. H. P. Sailer. Two hours per week. "Introduction to Bible" for those not prepared to study it in the original.

Rhode Island.—No State institution reporting.

South Carolina.—No State institution reporting.

South Dakota.—Biblical literature, four hours, twenty-four weeks, offered for the last three years. Elected only once, and then by 16 or 18 students. Aim: culture, literary, archæological, scientific. Two professors.

Tennessee.—Catalogue shows no work. Young Men's Christian Association.

Texas.—Catalogue shows no work. Young Men's and Young Women's Christian Association.

Utah.—Catalogue shows no work.

Vermont.—President conducts Bible class on Sundays.

Virginia.—No official provision, but much interest on the part of some teachers and students. Professor Willett.

Washington.—Catalogue shows none.

West Virginia.—Bible is taught only as a literary book, and Bible ethics as a part of general ethics.

Wisconsin.—Hebrew and New Testament Greek courses are numerous. Also there is listed under Hebrew: Isaiah, literary and historical study, two hours. History and geography of Palestine, one hour. In these there is no knowledge of Hebrew required.

Wyoming.—All instruction in religious matters is voluntary. No Young Men's Christian Association as yet.

COLLEGES HAVING BIBLE STUDY.

Of the 243 colleges in the list 197 report Bible study as a part of the curriculum. These are divided between required and elective work, as follows:

Requiring Bible work	129
Not requiring, but offering as an elective	68
Total	197
Requiring some and offering more as elective	40
Not requiring, but offering as an elective	68
Total offering Bible study as an elective	108

REQUIRED BIBLE STUDY.

One of the special points of interest in our investigation was the mode of instruction in required Bible courses. The number of hours per week devoted to the study in the colleges which make a requirement in Bible is shown from the following table:

Unknown	12
One-hour courses	67
Two-hour courses	23
Three-hour courses	12
Four-hour courses	5
Five-hour courses	17

There are one and two hour Bible courses in 90 colleges and three, four, and five hour courses in 34.

Digitized by Google

The 34 which adopt the method of frequently occurring exercises are named in the following condensed list, arranged by States:

Colleges having three, four, and five hour courses.

Arkansas .....Arkansas College, Philander Smith.
Colorado .....Presbyterian College of the Southwest.
Illinois.....Hedding, Blackburn, Carthage, Lake Forest, McKendree.
Iowa.....Charles City, Amity, Simpson, Tabor, Wartburg.
Maine.....Bowdoin.
Missouri .....Christian University.
Nebraska .....Doane, Gates, Nebraska Wesleyan.
North Carolina..Biddle, Davidson, Shaw.
Ohio .....Findlay, Hiram, Marietta. Muskingum, Oberlin.
Pennsylvania ...Grove City.
South Dakota ...Black Hills, Yankton.
Tennessee .....Southwest Presbyterian, Milligan, Fisk.
Washington.....Walla Walla.
Wisconsin .....Ripon.

There are two-hour courses of required work in the following colleges:

Colleges having two-hour courses.

Colorado .....Presbyterian College of the Southwest.
Illinois.....Chaddock, Augustana.
Iowa.....Upper Iowa, Simpson, Western.
Kansas.....Baker.
Minnesota .....St. Olaf, Macalister.
Missouri .....Westminster.
New Hampshire.Dartmouth.
North Carolina..Biddle, Davidson, Wake Forest.
Ohio .....Lima, Otterbein.
Pennsylvania ...Ursinus, Thiel.
Tennessee..... Central Tennessee College.
Washington.....Puget Sound.
Wisconsin .....Lawrence.

The following colleges require Bible study in one-hour courses (i. e., one period per week). There are appended some remarks made in their letters or catalogues, bearing on the preparation required for the lessons, and upon the value of one-hour required courses:

17. Philander Smith.—Twenty minutes each day throughout the course. The Greek Testament is taught in autumn of sophomore year.

20. Pomona.—One hour through the course. Two hours' preparation required and examinations. "Frequent testimonials and clear evidence of real and important value." Aim is culture, with strong devotional bias. Electives are also offered.

39. Trinity.—Held Monday morning. Great value.

44. Gallaudet.—Practically is a Sunday-school class. On the whole it is satisfactory.

47. Howard.—Freshman year, two terms. Also a Sunday-school class for boarders.

54. Atlanta.—Little preparation, and little value.

60. Emory.—Wonderfully successful, intellectually and religiously. Old and New Testaments are used. Through the course.

87. Northwestern College.—Through the course. Old and New Testament.

95. Wheaton.—Recitations and examinations. Very helpful. "We propose to be more exact in requirements."

102. Hanover.—Held Sunday. It is valued highly.

109. Earlham.—Required of nonresidents. Preparation voluntary; no examinations.

113. Coe.—One hour of preparation required. Use the Blakeslee method. "Formerly we used Smith; now the Bible."

Digitized by Google

116. Amity.—Their one-hour course is in New Testament Greek; required of sophomores.

123. Lenox.—Preparation and examination as in any other course. An improvement is noticed in college morals.

128. Cornell.—One-hour course on the Acts. (Possibly not required.)

136. Midland.—One hour for three years. Senior year, comparative religion and evidences of Christianity. Bible classes like other classes, except that there are more comments by the professor on the text.

155. Berea.—Lectures and examinations.

158. Center College.—Lectures and examinations. Through the course. Old and New Testaments.

166. Bethel.—Required of every student. Value, as judged by the interest of the students, is considerable. No examinations. Obligatory feature on account of the importance of Bible in literary course; but compensated for by giving credit in excess of time and labor given to it, as compared with other studies. Aim is culture, not excluding devotion. This depends on the current sentiment in college. Many have not studied, some not read, the Bible before coming. Would like to know best books and plans. We favor direct contact with the Bible. We have advanced; present state tentative. Some professors report their Bible classes to be their best.

176. Straight.—Weekly, three years.

202. Alma.—Preparation and examinations as in other course. We think highly of the work. No other influences character so much.

205. Benzonia.—"One hour a week through the course," is the reply; but only freshman year is devoted to Bible study; the rest is church history and evidences.

207. Hillsdale.—Examinations as in other courses. Seventy per cent is passing mark. Highly valuable.

208. Hope.—Examinations as usual. Seventy per cent is passing mark.

210. Olivet.—Freshmen, New Testament ethics; sophomores, planting and development of Jewish and Christian Church; juniors, evidences; seniors, doctrines and duties of Old and New Testaments. Aim, culture, with strong devotional element.

216. Carleton.—Freshmen and sophomores. Good grades are made.

236. Central.—"Some students, the best, appreciate the work; others study it because they are obliged to. It is taught for its religious influence."

246. Park.—Freshman and sophomore years. The theoretical has been separated from the devotional since 1890.

243. Missouri Valley.—Entrance requirements in Bible. One hour through the course. Endowed professorship. Usual academic methods.

251. Drury.—Two terms at least, each year, through most of the course. This includes, however, other religious instruction besides Bible.

269. Rutgers.—English Bible and evidences required for seniors.

281. Hamilton.—Through the course; systematically arranged. "We like the plan."

296. Biddle.—All freshman and sophomore and part of senior year, one hour; otherwise two and three hours.

299. Guilford.—Through the course. At least one hour of preparation. Aim, devotion and culture. "We value Bible work highly."

320. Cincinnati.—No definite information.

323. Western Reserve.—Freshman year. Two hours' preparation and semi-annual examinations. "Value great, if teaching is good."

329. Kenyon.—Freshman year. Preparation similar to that for other studies.

330. Denison.—Greek Testament, two terms. "We do not feel the need of an English Bible chair."

342. Heidelberg.—Two terms first three years. Study is growing more thorough.

347. Wooster.—First two years. Two hours' preparation; examinations. No question of the value of required Bible study. "The confessedly religious and denominational basis of our organization prevents the question. Bible is the best means to character, culture, and strong life."

351. Pacific.—Through the course. Aim, to learn the contents of the Bible. The Young Men's Christian Association does the devotional work.

362. Geneva.—Preparation as for other courses. Aim, information, inspiration.

Digitized by Google

363. Moravian.—Freshman year. Most of the students study for the ministry.

367. Lafayette.—Three years. Presumed to require two hours' study Sunday afternoon. Cheerfully attended, decorous, thoughtful.

368. Pennsylvania.—Freshman and sophomore years. Preparation as for other studies. Also a Sunday school.

371. Haverford.—Through the course. Regular work required. Highly valuable.

373. Franklin and Marshall.—Freshman year.

375. Lincoln.—Through the course. Memorizing is emphasized. On entrance an examination is required on Genesis and Mark. (College is for negroes.)

379. Westminster.—One term each year.

389. Washington and Jefferson.—Through the course; $100 prize for excellence in Bible study.

395. Erskine.—Four years' course. Graded as in other studies. Sunday. Growing appreciation of the work. Aim, devotion and culture.

396. Furman.—Some are interested; others would gladly be excused. Bible Union lessons used. "I am exceedingly anxious to find out the best method of securing effective Bible study, and will hail any light on this matter. More recitations are needed; can be secured by making part elective or by substituting Bible for something else."

397. Newberry.—Each class one hour. Recitations.

398. Claflin.—No previous study. Forty-five minutes daily devoted to Bible reading and study. Aim is devotional.

399. Wofford.—Half hour a week. The time is so short that no effort is made to make the exercise a drill. Practical aims are sought.

400. Pierre.—One-half hour, including chapel service. Probably more time will be given; more class work done. In the newer West we can not bring Bible teaching into very close class work. To secure the largest attendance we must use more general methods.

412. Knoxville.—Forty-minute periods. Through course. Aim, good Christians and good citizens. Examinations. A change from weekly to daily recitations is seriously considered.

414. Cumberland.—English Bible is a department of the English literature work during freshman year.

416. Maryville.—Through the course. Students take the work cheerfully and with interest for the most part; promotes seriousness and dignity. We think the moral and religious tone has been elevated; conversions multiplied; growth in grace of students and teachers promoted. Regular Bible work was introduced in 1889. All teachers participate and grow more expert each year. Young Men's Christian Association is somewhat under the influence of Mr. Moody's methods.

428. Greenville and Tusculum.—Forty-five minutes. Through the course. "Would like to have a good text-book. None of the several which I have seen satisfy me."

429. Washington.—Forty-five minute periods. Of great value. "Teaching is now distributed, but we will probably arrange to have one man do all the work."

440. Trinity.—Bible lessons in chapel, varied and adapted to the several grades of students.

456. Roanoke.—Sophomore year. Required work is not generally popular. Most work is done by Young Men's Christian Association.

466. Whitman.—Through course. Inductive study of the Bible.

472. Beloit.—Monday morning. Courses well organized.

Number of students in colleges requiring Bible work is: Men, 10,645; women, 2,720; total, 13,365; average, 104. It is, then, the smaller colleges which require Bible.

WHAT IS THE REQUIRED WORK?

Of the 129 colleges it is stated that Old Testament study is required in 49; New Testament in 77; using Greek New Testament alone, 13; using Greek in part, 9; Old and New Testaments, 40; Old Testament alone, 4; New Testament alone, 26; choice offered, 2 or 3. In these it usually occurs that the Testament which is omitted has been studied in the preparatory department. Old Testament history is, it seems, more frequently taught there than any other part of the Bible.

Digitized by Google

More than one-third of the colleges do not state in the catalogue or in their letters what part of the Bible is covered by the required work. Some of the one-third follow the Sunday School lessons. Some use a text-book and follow that.

Biblical history is most frequently studied. Different periods of the Old Testament times are not commonly separated in titles of courses. The Maccabean period is once specified. The New Testament history is divided into life of Christ (gospels, harmony) and Acts (Paul, early church history, propagation of the gospel, etc.). Almost all who make their requirement in Old Testament require Old Testament history. Biblical introduction is not known very widely as a science. Geography and antiquities are mentioned about six times. Introduction about as often. Outlines and analysis five times. History of the English Bible once. The Bible as literature is specifically mentioned three times.

VALUE OF REQUIRED WORK.

Only 39 answer the question. Twenty-four of these answers are from colleges having one-hour courses. Eleven say the value is great; 1, great if teaching is good; 1, helpful; 1, good grades are made; 1, growing appreciation; 1, considerable; 2, some interested, some not (more hours needed); 1, taken cheerfully for the most part; 1, unsatisfactory; 1, not popular; 1, little; little preparation; made a required subject last year; 1, does not know how much knowledge is gained, but it gives the professors a chance to reach the students; 1, changed to elective last year.

Five answers from two-hour course colleges say that they are valuable, appreciated, popular; a three-hour course college says decidedly valuable: 3 four-hour, profitable, useful, helpful; 2 five-hour, high, incalculable.

In addition to these few specific answers to the question as to the value it is to be noted that the one-hour plan is the older one, and that accordingly any change from that plan in favor of a larger number of hours per week is evidence of dissatisfaction, more or less pronounced, with the older method. At least they were searching for something more valuable.

ELECTIVE BIBLE STUDY.

The interest of the committee centered in the minimum rather than the maximum of Bible study. The information gained shows that the elective courses are found chiefly in the larger and better-equipped colleges, those which are the leaders in methods. The elective courses reveal in their subjects and methods the influence of competition with other academic courses, and offer fewer peculiar or questionable methods than is the case with the required courses in other colleges. The present report has not been developed in further detail.

The average number of students in colleges where Bible is offered only as an elective is 353; total number of students in them, 23,967.

Average attendance in colleges offering Bible either as required or elective work, 190.

TEACHING FORCE.

The inquiry concerning teaching force was answered by 142 colleges:

All teach in	6
Work assigned to from 1 to 9 teachers	37
Stated to be done by 1 man (or several, if the work is more than 1 man can do)	92
Of these there are special professorships (alone, or with evidences or ethics; perhaps the professor does other work, but this is his chief work) in	26
Attached to some other chair in	25
Not stated what other chair	6
Philosophy	11
English	8
Taught by the president in	25

Taught by the pastor	2
Taught by the chaplain	1
Taught by the lecturer	1
Taught by the professors in attached seminary	14

The following are the facts about Bible study in 9 of the 15 colleges for women, Division A.

1. Mills.—One hour per week required of juniors and seniors. Outlines of Bible study, using Steele's book. (This course, in addition to Sunday work in the college Sunday School.) One and a half hour's preparation is estimated for each lesson, conducted by the president and the pastor of the college church. Increase in thoroughness of work is a recent improvement. There are also courses of (outside) lectures on the Bible as literature. Our Bible work seems valuable.

2. Rockford.—One hour a week, freshman and sophomore years. One and a half hours' preparation. Regular work of teacher of philosophy. Have just been obliged to drop required Bible for juniors and seniors. This was on account of the many subjects in the curriculum for required study.

3. Smith.—Required work for freshmen, one-half year; sophomores, whole year; juniors, one-half year—all one hour. Kept one hour by reason of the numerous difficulties of making a change, which is in itself desirable. Elective work is well, increasingly, elected. The department is of equal dignity with others. One teacher in charge. Sophomores and juniors taking their electives are excused from their required work, in order to get them out of the one-hour courses; these are unscholarly and inefficient and opposed by a majority of the faculty.

6. Mount Holyoke.—Required, one hour a week for the first three years. Seniors have theism. Two hours' preparation, examinations, etc. Aim, culture and information. Elective work offered next year for the first time. Special chair of instruction in biblical literature. It is proposed to offer choice in the required work. The great question in college Bible study is one of method—method of conducting classes and of directing individual work of students.

7. Wellesley.—Required, one hour in freshman and sophomore years each; two in junior year. Juniors may choose between seven parallel courses. Preparation same as for other work. Aim, culture or general education. Work done by a corps of instructors designated wholly for this work. The department of biblical instruction has been recently organized. Much devotional study of the Bible among the students. Numerous electives open, with credit on degree.

9. Wells.—Required, one hour a week of freshmen and sophomores. Two hours of preparation, with rigid examinations. Electives offered to juniors and seniors. Largely elected. The biblical department was specially organized recently, and is in charge of a specially trained professor.

12. Vassar.—Have depended thus far upon lectures by specialists, given Sunday evenings; attendance of all students expected. "Will not say that we are satisfied with the method, for there is no way of testing the results, except as the students organize for special supplementary studies. However, I know of no better method than this, unless we are able to secure a special student of the Scriptures, who can offer attractive elective courses as well as a general prescribed course for the freshmen." The difficulties of arranging the curriculum are to be considered in this connection.

13. Cleveland College for Women.—Required for first three years, two hours' preparation and examinations as usual. No devotional aim.

14. Bryn Mawr.—Required once a week through the year, "Biblical literature." Numerous elective courses one and two hours a week. Required work is taken usually in the junior or senior year. Preparation the same as for other work. We regard it as of great value. Primary aim of biblical work is cultural, incidentally devotional. Special chair of instruction.

Digitized by Google

15. Randolph-Macon.—Definite Bible instruction only on Sundays, when the students meet the various professors, who present studies in various lines of Bible literature.

REVIEW OF THE SITUATION.

The conditions are most hopeful. The larger colleges—those best organized for work—are giving gratifying attention to Bible study.

Many of the smaller colleges are doing their best. A number express their desire to do more, signifying their purpose to develop the work as time and money and students increase. Some very frankly express their ignorance of the best methods, and say that they will gladly welcome any suggestions for improvement.

We regard the number and character of the responses received to our circular as in themselves indicative of considerable interest in the matter.

There is a disposition on all sides to increase the amount and quality of the work done. It is coming to be more on an equality with other departments. Recent appointments of special teachers are reported. Tentative instructorships are being made permanent.

Some of the State institutions have regular work. Others report themselves as being in sympathy with Bible study, and rely upon and actively cooperate with outside efforts to accomplish the desired ends.

On the other hand, it is evident that there is still great need of such efforts as this Institute stands for, and a great opportunity to secure still further gains.

Many, though by no means all, of the colleges which do not reply doubtless have little or no Bible study to report. There are colleges which make a report, though that has to be "no study." There are many schools where the so-called Bible instruction is distributed among the members of the faculty, with results which are inevitable. Too many answer our questions as if we were inquiring about common Sunday-school classes. From the answers received there is more than a suspicion warranted that the typical one-hour course is little more than the average Sunday-school class in method of conduct, dignity, and results. Add, however, to such a class the element of required attendance and we would expect to find what is stated in some instances to be the case, that the value is questioned, results indifferent, interest slight. "No preparation," "preparation slight," "preparation voluntary," "one hour's preparation is expected"—such phrases show the character of the work. Some who reply seem not to understand what Bible study means. They include in their statements evidences, church history, and ethics. One replies that they have Bible study one hour a week through the course, when only the freshman year is occupied with strict Bible study.

The State colleges are, or think that they are, hindered by law from doing Bible work—a condition which may be improved. The history and literature of the Hebrews and the Jews may and should be studied as other history and literature is studied. The peculiar religious element need not be dealt with, and modern sectarianism is not found in the Bible. Such a large and influential portion of universal history and literature should not be ignored, or information about it be left to chance instruction.

SUGGESTIONS.[1]

From the answers received, the committee feel justified in offering the following suggestions to the Institute:

1. The aim should be some Bible work in every college in the country, State institutions included.

2. Bible study should be conducted in the best modern way, with the use of the best books, and with the most skillful teachers obtainable. It is important that

[1] It may be observed that the necessary limits of this report render it impossible to present all the data upon which these suggestions are based. The subject has been fully considered, and the suggestions seem naturally to follow from the facts.

Digitized by Google

the colleges understand that modern methods and radical higher criticism are not synonymous.

3. Except under peculiar conditions the Bible itself should be studied, other text-books being used only to direct attention to this book itself.

4. A clearly-drawn line should separate Bible study as an immediately devotional exercise from Bible study as a part of the college curriculum.

5. The Young Men's Christian Association is well equipped for furnishing Bible work of a devotional nature, and is heartily to be commended to the colleges for that purpose. We make this suggestion with the more emphasis, because if the devotional work is given into the charge of this or some similar agency the problem of Bible study in the curriculum, for which credit is to be given toward an academic degree, is much simplified.[1]

6. The Young Men's Christian Association courses, or whatever other outside organization is in the field, or is brought in, should not supersede all curriculum courses. There is real and abundant need of both. The value of each is impaired if it is to do duty for both; while if each restricts itself to its own sphere, they may supplement each other perfectly.

7. The college Bible course should be so free from avowed and direct devotional aims, that the teacher can demand as thorough work as in any college course. Bible study will then take its place as a worthy part of the curriculum. When the student has joined the class, attendance, preparation, recitations, tests, examinations, theses, should correspond with those demanded in other college work.

8. The college should create as soon as possible a department of Bible study on a par with others, though the amount of work offered at first be small.

9. The teaching ought to be done by some one (or more, if the work to be done is more than one man's work) who is equipped for this work with the same thoroughness as is demanded of teachers in other departments. The committee would certainly not overlook the important influence upon the teachers, as well as upon the students, of the enlistment of the whole teaching force in Bible instruction. The assignment of the systematic curriculum work to a trained specialist should not and will not interfere with extra-curriculum devotional Bible classes led by the several professors.[2]

10. The committee agree heartily to recommend that one-hour courses be made at least three hours a week, in order to secure for them fuller recognition, closer application, more definite aim, and a better outlook for the elective work which should, and very often does, follow. We recommend this, even knowing that in most cases the work must be confined to fewer weeks. But conditions differ, and we do not feel ready to reject as valueless all one or two hour courses. After all, the character of the work done is the chief thing, and it may be that insistence upon three, four, and five hour courses would prove an artificial and needless condition. It is our judgment, however, that there is more than an accidental connection between one-hour courses and the Sunday School-like methods of the past; and that the easiest way to elevate the style of instruction in Bible is to concentrate the work. A one hour course is often, perhaps usually, regarded as an

[1] The committee are glad to draw attention to a very careful statement secured from Mr. J. R. Mott, summarizing and characterizing the work of the college department of the Young Men's Christian Association. Attention is called also to the reports printed in the Young Men's Christian Association Yearbook. Their statements of work done amply justify the claim made for them above, that they are well equipped for the kind of Bible work to which allusion is made.

[2] It will not be misunderstood that we urge less Bible study of a devotional character, or Bible study that is less devotional, among college students; on the contrary, we would organize it in such a way that it can become, and can be kept, truly devotional. The recommended distinction between curriculum study and extra-curriculum devotional study is not made until we are sure that there are agencies in the field entirely competent, with the counsel of individual professors, to conduct courses of this character in a way to secure the best possible results.

Digitized by Google

extra, which must not be allowed to interfere with the regular five hour courses. So long as, and in so far as, one hour Bible courses are thus originated, and an entrance is granted only grudgingly to the Bible as a study, results will certainly not be satisfactory. It is absolutely essential that the importance of the study be conceded and maintained by the college authorities. This being the attitude, the one hour feature is not an unsurmountable difficulty. If the conditions seem to require it, a weekly exercise can be made a success; experience has abundantly proved that. The committee makes this explanation in order to avoid discouraging the many colleges where better arrangements can not at present be made.

11. The committee has no recommendation as to required *versus* elective Bible courses in college. The conditions in and around one college differ so largely from those of another that each must probably think the matter through for itself. One college finds required work satisfactory from every point of view. Another finds it the opposite; students and teachers dislike it. One (a unique one, indeed) is just making its work required. Another is making its work elective.

It would seem a natural outcome of the careful differentiation of devotional study of the Bible from the curriculum study, which has been recommended above, that an important objection to the requirement of Bible study from college students disappears, viz, that it interferes with the sovereign rights of an American. It seems that a boy reaches the age of consent earlier in religious matters than in intellectual. Horace's Odes and Greek philosophy, but not the Psalms or the teaching of Jesus, may be required studies for him.

On the other hand, the absence of the strictly devotional element would for many destroy the chief argument for making Bible study required. It would seem, however, that moral and religious profit from the study of the Bible does not disappear with the disappearance of the immediately devotional element; that Bible truth presented without appeal or invitation, presented as judicially as possible; that the facts of the Bible, recited as the facts of profane history are recited; that the ethics of the Bible, studied as any other subject is studied (and no conscientious scruples, however abnormally developed, can reasonably stand in the way of such treatment), ought to form in the end as potent an influence over thoughtful men and women as could be demanded.

12. Bible study in State universities should receive more detailed study. It is in order, however, to state our conviction that State enactments against biblical instruction are directed against it as it was formerly given, and that with the rise of the new methods of study of the Bible, and with the training of men ready and fitted to conduct it with entire respect for the religious scruples of students and parents, just as a novel may be studied without the inculcation of all the follies of its characters, or as historical study does not compel us to adopt the vices of its heroes, abundant freedom may be had for Bible study. It is a sad commentary on former methods that the phrase prohibiting teaching which is "sectarian in religion" should be quoted as forbidding Bible study. Doubtless the legal difficulties differ in the various States. It may well be that the use of State funds for the salary of a teacher of the Bible would be illegal, whereas the State could not decline to receive and administer gifts to endow such a chair. It may be that the time has not yet come when it would be fitting to press the claims of formal Bible study upon certain State institutions. Meantime, there is an abundant opportunity, with rare, if any, exceptions, to include Hebrew history in ancient history, biblical masterpieces of literature in literary courses, biblical ethics in general ethics, until, in entire conformity to law, the students are put in possession of a fair knowledge of Bible facts.

CHAPTER XXXII.

THE BIBLE IN THE PUBLIC SCHOOLS AND STATE UNIVERSITIES.

I.—Report concerning Bible reading in the public schools of the United States, prepared by Elizabeth B. Cook, president Chicago Woman's Educational Union.
(1) Origin of the investigation.
(2) Detailed report, by States, of the present practice relative to Bible reading in the public schools.
(3) Tabulated summary of statements made by school superintendents.
(4) Readings from the Bible selected for school.
II.—The Bible in the public schools; from an address by Dr. A. P. Peabody, of Harvard University.
III.—The English Bible and State Universities, by Rev. Dr. Young, field secretary of the Christian Woman's Board of Missions.

In May, 1896, the Chicago Woman's Educational Union requested its president to prepare a statistical and historical report concerning Bible reading in the public schools of the United States. In compliance with the request, letters of inquiry were sent to the 45 State superintendents of schools, all of which, with two exceptions, have been answered. Two forms of blanks were sent to county and city superintendents of schools, one containing the following questions, the other two less:

Are portions of the Bible read regularly in all the schools of your city?
If not, is the Bible read in part of them?
If read, for how many years has this been the custom?
If not, was it formerly read there?
For how many years?
Is there a rule of your board on this matter?

Although many of these blanks reached the superintendents after their schools were closed for the summer and many school officers had no accurate data upon the subject, replies were received in response to these inquiries from every State of the Union. The earnest and cordial spirit pervading these returns was noticeable.

Dividing the United States for convenience into the North and South Atlantic, the South and North Central, and the Western portions, their attitude toward Bible reading in the public schools is found to be as follows:

NORTH ATLANTIC DIVISION.

MAINE.

Hon. W. W. Stetson, State superintendent of schools, Augusta, Me., reports in general as follows:

I am very happy to be able to report that the opening exercise in most of the common schools of this State consists of reading a passage of Scripture by the teacher and repeating the Lord's Prayer by the teacher and pupils.
This custom is so general that I think it is unnecessary to attempt to collect any statistics upon this matter in this State.

Reports from superintendents and school officers from 9 of the 16 counties in Maine, received since June 17, 1896, state that there is Bible reading in every school. In the tenth, teachers read or not, as they please.

Digitized by Google

As soon as the Pilgrims penetrated the wilds of Maine and established schools, the Bible was the Book *essential*. Through public spirit and respect for the Government, in whose interest public schools are administered, daily reading of the Bible has been maintained for two hundred and seventy-one years.

The rule for the opening exercises in the schools of Portland, Maine's chief city, is as follows:

Reading of select portions of Scripture by the teacher and the repeating of the Lord's Prayer in concert by the pupils shall constitute the opening exercises of the schools.

The practice of the school teachers of Maine is in harmony with the decision of Justice Appleton, which was concurred in by the entire bench of seven members of the supreme court of Maine (see 38 Maine, 379).

The Maine court says:

If the Bible, or any particular version of it, may be excluded from the schools because its teachings may be opposed to the teachings of the authorities of any church, the same result may ensue as to any other book. If any one sect may object, the same right must be granted to others. This would give the authorities of any sect the right to annul any regulation of the constituted authorities of the State as to the course of study and the books to be used. It is placing the legislation of the State, in the matter of education, at once and forever in subordination to the decrees and teachings of any and all the sects, when their members conscientiously believe such teachings. It at once surrenders the power of the State to a government not emanating from the people nor recognized by the constitution. * * * As the existence of conscientious scruples as to the reading of a book can be known only from the assertion of the child, its mere assertion must suffice for the exclusion of any book in the reading or in the hearing of which it may allege a wrong to be done to its religious conscience. * * * As a right existing on the part of one child, it is equally a right belonging to all. As it relates to one book, so it may apply to another, whether relating to science or morals. * * * As the child may object to reading any book, so it may equally object to hearing it read for the same cause, and thus the power of selection of books is withdrawn from those to whom the law intrusts it, and by the right of negation is transferred to the scholars. The right as claimed undermines the power of the State. It is that the will of the majority shall bow to the conscience of the minority or to the conscience of one. * * * Nor is this all; while the laws are made and established by those of full age, the right of obstruction, of interdiction, is given to any and all children, of however immature age or judgment.

NEW HAMPSHIRE.

The New Hampshire school law, Chapter III, sections 15, 17, and 18, is as follows:

SEC. 15. No book or tract designed to advocate the tenets of any particular sect or party shall be permitted in any of the schools, nor shall any sectarian or partisan instruction be given by any teacher in the same.

SEC. 17. Good morals being of the first importance to pupils and essential to their highest progress in useful knowledge, instruction therein shall be given in each of the schools, and the principles of truth and virtue faithfully inculcated upon all suitable occasions. The pupils shall be carefully instructed to avoid idleness and profanity, falsehood and deceit, and every wicked way and disgraceful practice, and to conduct themselves in an orderly, courteous, and respectful manner; and it shall be the duty of the instructors, so far as practicable, to exercise a general inspection over them in these regards both in and out of school and while going to the same and returning home.

SEC. 18. The morning exercises of all the schools shall commence with the reading of the Scriptures, followed by the Lord's Prayer.

Hon. Fred Gowing, State superintendent of schools, Concord, N. H., writes June 20, 1896:

I not only do not object to using the actual Bible, leaving to the teachers' discretion the selection of passages, but encourage it.

Reports from superintendents or teachers in all but one of the counties of New Hampshire have been received. In all the schools of the State, with a very few exceptions, the Bible is read and has been since the schools were first established

Digitized by Google

(about 1623). Many of the school boards emphasize the State law for Bible reading with local rules.

VERMONT.

Hon. Mason S. Stone, State superintendent of education, Montpelier, Vt., writes:

We encourage Bible reading in our public schools, although we have no law requiring it. The Bible is read in nearly every school. The Lord's Prayer and Bible verses are quite generally recited.

Three local reports received show that the general custom from the earliest existence of the schools has been to have the Bible read daily. One of these states that the Bible is not read in the graded schools of the town, but in the outlying districts only. A second states that it always has been read in a part of the schools, and the third that it has always been read in all the schools

MASSACHUSETTS.

Hon. Frank A. Hill, secretary State board of education, Boston, Mass., writes June 15, 1896:

So far as my knowledge, my observation, and my experience go, the schools of Massachusetts read selections from the Bible once a day. The repetition of the Lord's Prayer is generally used in connection with the devotional exercises, and the singing of sacred music, while not universal, is exceedingly common.

The enthusiasm with which chairmen of school boards and other officers of schools send in their affirmative reports (100 received) shows a deep interest in Bible reading in schools. For two hundred and seventy-six years the Bible has been most intelligently read by the people of Massachusetts.

The State law upon this subject is as follows:

SEC. 32. The school committee shall require the daily reading in the public schools of some portion of the Bible without written note or oral comment, but they shall not require a scholar whose parent or guardian informs the teacher in writing that he has conscientious scruples against it to read from any particular version, or to take any personal part in the reading; nor shall they direct to be purchased or used in the public schools schoolbooks calculated to favor the tenets of any particular sect of Christians.

In the current edition of the State school laws the following annotations are made to this section:

The school committee of a town may lawfully pass an order that the schools thereof shall be opened each morning with reading from the Bible and prayer, and that during the prayer each scholar shall bow the head, unless his parents request that he shall be excused from doing so; and may lawfully exclude from the room a scholar who refuses to comply with such order, and whose parents refuse to request that he shall be excused from doing so. (12 Allen, 127.)

It is the settled policy of the State to require the use of the Bible in the public schools, and since the passage of the act of 1855 there have been but few objections made.

The duty of the committees is performed if they require the Bible to be read by the teachers as a part of the morning devotional service. The law does not prescribe, as a rule from which there are to be no deviations, that every pupil who may be able to read the Bible shall be required to do so. In this respect a discretion is vested in the committees. No sectarian books are used in the schools.

Many school committees have local rules, some of which we quote below:

RULE OF THE CITY OF CAMBRIDGE.

Morning exercises in all the schools shall begin with reading from the Scriptures and the Lord's Prayer.

RULE OF THE CITY OF BEVERLY.

11. All teachers shall, according to the requirements of the laws of this Commonwealth, as set forth in the public statutes, in chapter 44, section 15, exert their best

Digitized by Google

endeavors to impress on the minds of children and youth committed to their care and instruction the principles of piety and justice and a sacred regard to truth; love of their country, humanity, and universal benevolence; sobriety, industry, and frugality; chastity, moderation, and temperance, and those other virtues which are the ornament of human society and the basis upon which a republican constitution is founded; and it shall be the duty of such instructors to endeavor to lead their pupils, as their ages and capacities will admit, into a clear understanding of the tendency of the above-mentioned virtues, to preserve and perfect a republican constitution and secure the blessings of liberty as well as to promote their future happiness, and also to point out to them the evil tendency of the opposite vices.

80. The morning session in all the schools shall open with reading from the Bible.

THE CHELSEA SCHOOL LAW.

SEC. 45. In each schoolroom the morning exercises shall commence with the reading of suitable selections from the Bible by the teacher, to be followed by the audible repetition of the Lord's Prayer by the teacher alone, or by the teacher and pupils in concert.

SEC. 46. Good morals being of the first importance to the pupils and essential to their highest progress in useful knowledge, instruction therein shall be given in each of the schools, in conformity with the provisions of public statutes (chap. 44, sec. 15) and the principles of truth and virtue faithfully inculcated upon all suitable occasions. The pupils shall be carefully instructed to avoid idleness, profanity, falsehood, deceit, and every wicked and disgraceful practice, and to conduct themselves in an orderly and proper manner; and it shall be the duty of their instructors, so far as possible, to exercise a general inspection over them in these regards both in school hours and while going to and from school.

THE FITCHBURG RULE.

SEC. 3. The beginning of the morning exercises in the school shall include the reading of some portion of the Bible without comment, but no scholar shall be required to read therefrom whose parent or guardian shall notify the teacher that he or she has conscientious scruples against such reading.

THE SALEM REGULATION.

Morning exercises in all the schools shall commence with the reading by the teacher of some portion of the Bible, without written note or oral comment; but no pupil shall be required to read from any particular version whose parent or guardian shall state in writing that he has conscientious scruples against allowing him to read therefrom.

NEW BEDFORD SCHOOL LAW.

[Chapter XV, sec. 4, as amended December, 1894.]

Opening morning exercises.—A portion of the sacred Scriptures shall be read without comment to the pupils by the teacher of each school at the opening of the morning session; also a patriotic selection shall be recited or a patriotic song shall be sung by the school; and the board recommends that the Lord's Prayer be repeated by the teacher alone or by the teacher and pupils in concert.

THE NEWBURYPORT RULE.

SEC. 3. The teachers shall open their respective schools in the morning with reading of the Scriptures and the recitation of the Lord's Prayer, the opening exercises not exceeding ten minutes in length; and it is recommended that the afternoon services close with singing.

In 1642 an ordinance was passed requiring "chosen men" to take account of the ability of children "to read and understand the principles of religion and the capital laws of this country."

An ordinance establishing grammar schools was passed November 11, 1647, in the preamble of which occurred a clause indirectly showing that our earliest legislators attached importance to a knowledge of the Bible. The clause is as follows:

It being one of the chief projects of that old deluder, Satan, to keep men from the knowledge of the Scriptures, etc.

Digitized by Google

In 1654 an ordinance was passed forbidding the continued employment of teachers who had manifested themselves "scandalous in their lives and not giving due satisfaction according to the rules of Christ."

More than one hundred years later, in 1789, an act was passed making it the duty of instructors to impress upon their pupils "the principles of piety, justice, and a sacred regard to truth; love to their country, humanity, and universal benevolence; sobriety, industry, and frugality; chastity, moderation, and temperance, and those virtues which are the ornament of human society and the basis upon which the republican constitution is structured.

"According to the New England theory of life, it was absolutely essential that everyone from early childhood should be taught to 'read and understand the Bible and other good and profitable printed books in the English tongue.'"

This feeling strengthened with the passing years, and, as regards Bible reading in schools, indefiniteness changed to clearness and option concerning Bible reading to judicious and careful requirement.

RHODE ISLAND.

Under date of June 13, 1896, Hon. Thomas B. Stockwell, State commissioner of public schools, Providence, writes:

I inclose extract from the last edition of our school manual, which shows very clearly the relation of the State to the subject of religious and moral teaching in the public schools. Twenty years ago I made quite a careful study of this subject and embodied it in my annual report, of which I am able to send you a copy.[1]

It is my impression that there has not been much change since then. If any change, it is in the direction of less reading of the Bible.

The report states that 10 towns require by rule the reading of the Bible. That in 5 it is simply recommended by them; that in 6 either the reading of the Bible or a prayer, generally the Lord's prayer, is required. In 1 town some moral or religious exercise is made obligatory. In 12 towns no rule or recommendation upon the specific subject exists.

Passing from rule to practice, Mr. Stockwell found it to be the almost universal custom to open the daily session with some form of devotional exercise, of which the reading of the Scriptures formed an important part.

Returns received directly from 11 towns and cities in Rhode Island ratify, so far as their localities are concerned, Mr. Stockwell's report. They show (1) that the use of the Bible is recommended to teachers; (2) that it has always been the custom in the school; (3) 6 of the 11 cities and towns report that the Bible is read in every school. The management in 1 city and in 1 town have adopted rules requiring Bible reading. In the rest Bible reading is optional, but universal in 4 of the remaining 9 localities, and almost universally read in 2 more, and read in some of the schools of the remaining 3. One of these is Providence, the largest city in the State.

Mr. Stockwell's report contains the following, on—

MORAL CULTURE.

While we acknowledge fully the labors of the teachers in this branch of their work, we can not also fail to recognize the existence of a lower moral tone in the community than formerly prevailed. For various reasons, some inseparable from our condition, and others the result of our own negligence, we have fallen upon a period when the public morals are at a low state. In this condition of affairs there is devolved upon the schools the greater necessity for lending all the aid in their power to the work of elevation.

School officers in their selection of teachers should exercise a wide discretion and seek for those individuals who can be relied on as efficient and faithful

[1] The great value of this article has lead to its insertion almost as a whole on the following pages.

Digitized by Google

instructors in virtue. Teachers are called upon to throw more of devotion into their work, and to labor for the education of the heart as well as of the head. They must not be satisfied with keeping the letter of the law, but must live up to its spirit with a heartiness that shall carry before it all opposition and indifference.

The accompanying special report to the general assembly was prepared, as its tenor indicates, in response to a resolution passed by that honorable body at the May session. I have thought it best to incorporate it in this report, in order that it might take a more permanent form, regarding it as of some future value, at least as showing the present status of our schools in reference to this great question.

To the Honorable the General Assembly:

I have the honor to present the following report in response to a resolution adopted by your honorable body at the May session, 1876, to wit:

"*Resolved* (*the senate concurring*), That the commissioner of public schools be instructed to report to the general assembly, at the next January session, whether any and what means are used in the public schools 'to implant and cultivate in the minds of all children therein the principles of morality and virtue,' as provided in section 6 of chapter 54 of the general statutes."

The chapter of the general statutes from which the quotation in the above resolution is made is the one which refers mainly to teachers, the conditions of their service, and their duties. The whole section referred to reads as follows: Every teacher shall aim to implant and cultivate in the minds of all children committed to his care the principles of morality and virtue.

From the tenor of this chapter, and especially of this section, coupled with the fact that the subject of *morals* is nowhere else alluded to in the laws relating to schools, and that such has always been the fact since the first enactment of the law, I have always supposed it to have been the purpose of the general assembly to place the subject of moral instruction chiefly in the hands of the individual teachers in preference to those of any official or body of officials.

In accordance, therefore, with these facts, we can not expect to find that well-defined system or comprehensive plan of instruction in this department that we should in reference to those subjects which are specifically placed under the control and direction of the school authorities. It needs, however, but a survey of the various reports of the school committees of the several cities and towns in the State for the last few years, and especially for the past year, to show conclusively that the school authorities throughout the State are deeply alive to the importance of the subject, that they are ready and anxious to take as advanced ground in the matter as the sentiment of their respective constituencies will permit, and that they are now exerting a constant influence in all directions, upon both teacher and pupil, in order to bring them up to a higher moral law.

Of the means used to secure moral and virtuous development, we naturally consider the Bible first. As a result of my inquiries on the subject I have received information from all but 2 of the 36 cities and towns in the State. I find that in 10 towns the reading of the Bible is required by a rule of the committee; that in 5 it is simply recommended by them; that in 6 either the reading of the Bible or a prayer, generally the Lord's prayer, is required, while in 1 town "some moral or religious exercise" is made obligatory. In the other 12 towns no rule or recommendation upon this specific subject exists.

Passing now from rule to practice, I find from the testimony of the several town superintendents that not only in those towns where there is a specific rule or recommendation, but also in all of the others it is almost the universal custom to open the daily session with some form of devotional exercises, of which the reading of the Scriptures forms generally an important part, and often the whole. As a result of my own observation I have noticed that it is now much more common than formerly for the teacher to read the Scripture selection alone, instead of making the exercise a concert or responsive one. This course I believe to be the best calculated to produce the desired impression upon the minds and hearts of the pupils. It will thus be seen that there are but few schools in our State wherein the pupils are not brought into daily contact with the Scriptures, the fountain of all truth, the source of all virtue, the essence of all morality. * * *

As every school is, in a certain sense, a minature government and the same principles underlie its existence and control its life as in the case of the nation, it is, of course, both the duty and the privilege of the teacher to call the attention of his pupils to these fundamental ideas and to impress them upon them as the mainspring of their actions. * * *

A reference to the "rules and regulations" adopted by the several school committees will, in nearly all cases, I think, reveal the presence of one or more provisions

Digitized by Google

upon the matter of morals and behavior, and referring to both teacher and pupil. In illustration of this influence I have the pleasure of quoting one rule from each of the recent reports for two towns, situated quite remote from each other, and thus fairly representing the State as a whole.

The first: "It shall be the duty of the teachers to use their best endeavors to impress upon the minds of the youth committed to their care and instruction the principles of piety, justice, and a sacred regard for truth; love to their country, humanity, and universal benevolence; sobriety, industry, frugality, chastity, moderation, temperance, and those other virtues which are the ornament of human society and the basis upon which a republican constitution is founded; and they shall endeavor to lead their pupils, as their ages and capacities will allow, into a clear understanding of the tendencies of those virtues, to preserve and perfect a republican constitution and secure the blessings of liberty as well as promote their own happiness, and also to point out to them the evil tendency of the opposite vices."

The second: "Good morals being of the first importance, and essential to their progress in useful knowledge, pupils are enjoined to avoid all vulgarity and profanity, falsehood and deceit, and every wicked and disgraceful practice. They will be expected to conduct themselves in an orderly manner, both in and out of school; to be diligent and attentive to their studies; to treat each other kindly and politely in all their intercourse; to respect and obey their teachers, and to be punctual in their attendance."

From what precedes, it will be seen, I think, that the main force to be relied upon for the promotion of moral culture, is not so much a system of ethics or a well organized plan of instruction as the *life* which the teacher lives before his pupils. The most effective means for implanting the seeds of virtue and inculcating a sound morality are often the almost unconscious words and acts of the sincere and faithful teacher, which are, as it were, the spontaneous overflow of his own pure character. * * *

In recognition of this truth, and also of the consequent responsibility resting upon them, I am glad to be able to report that the school authorities of various towns are adopting more and more stringent rules in reference to the moral qualifications of their teachers. I hope the standard will be raised still higher, and they shall be sought for not merely the negative grace of a character without reproach, but the positive virtue of an aggressive morality.

From "Instruction to teachers," in the last school manual of Rhode Island, Mr. Stockwell sends the following:

Moral instruction should, by all means, be inculcated by the teacher, but yet so as to avoid all sectarian comment or bias.

The rule as laid down in the law of the State of Massachusetts (see text of law under "Massachusetts"), while it points out and inculcates the duty of the teacher to give moral instruction, is carefully drawn to avoid giving countenance to any attempt to impart sectarian instruction and may well be followed in this Commonwealth. [And adopted by it and by every other Commonweath in the United States.—Ed.]

Here follows extract from Massachusetts statutes, as quoted under "Massachusetts" in "Rule of the city of Beverly."

Mr. Stockwell continues:

Reading the Bible and praying in schools.—The constitution and laws of the State give no power to a school committee, nor is there any authority in the State, by which the reading of the Bible or praying in school, either at the opening or at the close, can be commanded and enforced. On the other hand, the spirit of the constitution and the neglect of the law to specify any penalty for so opening or closing a school, or to appoint or allow any officer to take notice of such an act, do as clearly show that there can be no compulsory exclusion of such reading and praying from our public schools. The whole matter must be regulated by the consciences of the teachers and inhabitants of the district and by the general consent of the community. Statute law and school committees' regulations can enforce neither the use nor disuse of such devotional exercises. School committees may recommend, but they can go no further.

It is believed to be the general sentiment of the people of Rhode Island that this matter shall be left to the conscience of the teacher; and it is expected that if he read the Bible as an opening exercise, he shall read such parts as are not controverted or disputed, but such as are purely or chiefly devotional; and if he pray at the opening of his school, he shall be very brief and conform as nearly to the

Digitized by Google

model of the Lord's Prayer as the nature of the case will admit. And in all this he is bound to respect the conscientious scruples of the parents of the children before him, as he would have his own conscientious scruples respected by them in return; always, of course, taking care that in the means he uses to show his respect for the consciences of others he does not violate the law of his own conscience.

In regard to the use of the Bible in schools, two observations occur here. If the committee prescribes or the teacher wishes to have the Bible read in school, it should not be forced upon any children whose parents have any objections whatever to its use. In most cases the teacher will have no difficulty with the parents on this subject if he conducts with proper kindness and courtesy.

CONNECTICUT.

Charles D. Hine, secretary of the State board of education, Hartford, Conn., under date of July 17, 1896, writes:

In most schools of the State the Bible is read, or some part of the Bible recited; often it is a portion of the Psalter. There is, however, no uniform practice. In most of the best schools the only opening exercise is the Lord's Prayer or some devotional exercise, with singing. As I have said, however, in most schools the Bible is read and always has been read. Generally there is no objection to it.

Hartford, Connecticut's largest city, has a rule for Bible reading, which, it may be unnecessary to say, is observed.

Bridgeport and Meriden (with a population of 48,856 and 21,230, respectively) have each a carefully observed rule requiring Bible reading. Although left to the teacher's discretion, so far as the reports received show, in the other cities of the State, Bible reading is carefully observed in all of them, with one exception, and in many of the schools of that one.

The early legislation of Connecticut is similar to, when not identical with, that of Massachusetts.

From the summary of the system of public instruction in Connecticut at the opening of the eighteenth century, made by Dr. Henry Barnard, notice the following:

It is an obligation on every parent and guardian of children "not to suffer so much barbarism in any of their families as to have a single child or apprentice unable to read the Holy Word of God and the good law of the colony," and also "to bring them up to some lawful calling or employment," under a penalty for each offense.

NEW YORK.

The great metropolis of the Empire State has a positive law concerning Bible reading in public schools. It stands as follows:

RULE FOR BIBLE READING IN SCHOOLS IN THE CITY OF NEW YORK.

[All schools to be opened by reading the Bible.]

SEC. 134. All the schools of this city under the jurisdiction of the board of education shall be opened with reading a portion of the Holy Scriptures, without note or comment.

Further instructions relating to this subject in the city are:

SEC. 1062. No school shall be entitled to or receive any portion of the school moneys in which the religious doctrines or tenets of any particular Christian or other religious sect shall be taught, inculcated, or practiced, or in which any book or books containing compositions favorable or prejudicial to the particular doctrines or tenets of any particular Christian or other religious sect shall be used, or which shall teach the doctrines or tenets of any other religious sect, or which shall refuse to permit the visits and examinations provided for in this chapter. But nothing herein contained shall authorize the board of education to exclude the Holy Scriptures, without note or comment, or any selections therefrom, from any of the schools provided for by this chapter; but it shall not be competent for the said board of education to decide what version, if any, of the Holy Scriptures, without note or comment, shall be used in any of the schools: *Provided*, That

Digitized by Google

nothing herein contained shall be so construed as to violate the rights of conscience as secured by the constitution of this State and of the United States.

The rule for Brooklyn, which she has observed with no record to the contrary since her schools were established, is as follows:

Part III, section 5.—(At the opening of school.) A portion of the Holy Scriptures shall be read aloud by one of the teachers in each department, without note or comment.

Returns from 94 school officers, residing in 48 of the 59 counties of New York, are received. About one-half of them, as school commissioners, speak for a section of a county each. Fifty-three of these report Bible reading as an opening exercise in all of their schools. Two others think the custom is universal, it being the expressed wish of the superintendents to have the Bible read. Twelve others report that the Bible is read in nearly all or in a very large per cent of their schools, and the statement is generally made that the custom is as old as the schools. Three report written or unwritten local rules prohibiting Bible reading. Nine others report no Bible reading. In these schools, with two exceptions, it is stated that the Bible was formerly read in them. Three state that the Bible is read less than formerly, while two report that the custom seems to be growing, a larger per cent of teachers in the counties reading the Bible than formerly. In the rest the Bible is read to some extent. As teachers do not usually report concerning this custom, data are not so easily obtained nor so reliable as on some less important subjects. The reports show unmistakably that New York in its public schools is a Bible-reading State.

The early records of New York afford many proofs that its tendencies were not very different from those of its more eastern sisters. The following facts and statements are found in Morris's History of the Character of our Civil Institutions:

The first emigrants (to New York) were those who had fled from the severity of religious persecution in the seventeenth century in the French-Belgic provinces, and came with a faith tried in a fiery furnace.

The East India Company, formed in 1621, stipulated that "where emigrants went forth under their auspices and that of the States-General of Holland, it should be their duty to send out a schoolmaster, being a pious member of the church," whose office it was to instruct the children and preside in their religious meetings on the Sabbath and other days, leading in the devotions, and reading a sermon, until the regular ministry should be established over them.

The first settlers of New Rochelle and West Chester counties were said to have such regard for the sanctity of the Sabbath that they would take up their march of foot Saturday noon for public worship 20 miles away, engage in the services, remain until after midnight, and then take up their homeward way, relieving the monotony and weariness of the journey with the singing of hymns.

An order for the opening and closing exercises of a school at Long Island, adopted October 8, 1662, contains the following:

"ART. 2. When school opens, one of the children shall read the morning prayer as it stands in the catechism, and close with the prayer before dinner; and in the afternoon the same. The evening school shall begin with the Lord's Prayer and close by singing a psalm."

In a letter written on the 11th of August, 1628, by Rev. Jonas Michaëllus, the first minister of the Dutch Reformed Church in the United States, there is found the following statement:

"We must have no other object than the glory of God in building up His kingdom and the salvation of many souls. As to the natives of this country, I find them entirely savage and wild, proficient in all wickedness, who serve nobody but the devil. Let us, then, leave the parents in their condition, and begin with the children who are still young and place them under the instruction of some experienced and godly schoolmaster, where they may be taught especially in the fundamentals of our Christian religion."

The constitution of the State as formed in 1777, and also as re-formed in 1821, contains the following:

"This convention doth further, in the name and by the authority of the good people of this State, ordain, determine, and declare that the free exercise and enjoyment of religious profession and worship, without discrimination or preference, shall forever hereafter be allowed within this State to all mankind: *Provided*,

Digitized by Google

That the liberty of conscience hereby granted shall not be so construed as to excuse acts of licentiousness or justify practices inconsistent with the peace or safety of the State."

In 1838 the legislature of New York, by a vote nearly unanimous, declared that—

"In all countries some kind of religion or other has existed in all ages. No people on the face of the globe are without a prevailing national religion. Magistrates have sought in many countries to strengthen civil government by an alliance with some particular religion and an intolerant exclusion of all others. But those who have wielded this formidable power have rendered it a rival instead of an auxiliary to the public welfare—a fetter instead of a protection to the rights of conscience. With us it is wisely ordered that no one religion shall be established by law, but that all persons shall be left free in their choice and in their mode of worship. Still, *this is a Christian nation. Ninety-nine hundredths, if not a larger proportion, of our whole population believe in the general doctrines of the Christian religion.* Our government depends for its being on the virtue of the people—on that virtue that has its foundation in the morality of the Christian religion; and that religion is the common and prevailing faith of the people. There are, it is true, exceptions to this belief; but general laws are not made for excepted cases. There are to be found, here and there, the world over, individuals who entertain opinions hostile to the common sense of mankind on subjects of honesty, humanity, and decency; but it would be a kind of republicanism with which we are not acquainted in this country which would require the great mass of mankind to yield to and be governed by this few.

"It is quite unnecessary to enter into a detailed review of all the evidences that Christianity is the common creed of this nation. We know it, and we feel it, as we know and feel any other unquestioned and admitted truth."

NEW JERSEY.

C. J. Baxter, superintendent of public instruction, Trenton, N. J., writes:

Many boards require the Bible to be read. A few do not. It is read in nearly all of the schools, and has been as far back as I can remember.

Bancroft writes:

The people (of New Jersey) rejoiced under the reign of God, confident that he would beautify the meek with salvation. The motto on the provincial seal was, "Righteousness exalteth a nation."

With this early record it is not surprising to learn that the following rule is to be found in the school laws of the State of New Jersey, 1895, page 45, section 123:

It shall not be lawful for any teacher, trustee, or trustees to introduce into or have performed in any school receiving its proportion of the public money any religious service, ceremony, or forms whatsoever, except reading the Bible and repeating the Lord's Prayer.

Jersey City has the following rule:

The principals of the several departments shall open their schools each morning by reading a portion of the Scriptures, without note or comment.

From 21 reports received, 19 state that the Bible is read in all the schools. Of this number, 12 cities have special laws requiring Bible reading. One report states that it is read in nearly all, and the other that only the Lord's Prayer is used.

The rule for the Hoboken schools is:

RULE LVII.

SEC. 81. The opening exercises of each department shall consist of the reading of a chapter out of the Bible (no comments to be made) and repeating the Lord's Prayer. During the above exercises the doors shall be kept closed and good order shall be observed.

RULE LVIII.

SEC. 82. The opening exercises shall close at 9.15 a. m.

The Passaic rule is:

At the opening of the morning session each day they shall read, or cause to be read, without comment, a selection from the Bible. This exercise may be accompanied by singing a hymn and repeating the Lord's Prayer.

Digitized by Google

In Long Branch City schools are opened with Bible reading and chanting the Lord's Prayer.

PENNSYLVANIA.

The Book of School Laws and Decisions for the State of Pennsylvania contains the following decisions, page 146, Nos. 114 and 115:

114. The Scriptures come under the head of text-books, and they should not be omitted from the list.
115. Sectarian works and all books of controversial or immoral tendency should be excluded. The common school is no place for controversy or the implanting of the habit of it, either on religious or political subjects, much less for books or lectures of questionable morality.

In the report of the superintendent of the State for the school year ending June 3, 1895, the total number of schools in the State is 18,019. The number in which the Bible is read is 15,780, or more than 87½ per cent.

Pennsylvania, taking advantage of this principle for the good of the schools, presents accurate reports upon the subject. Other States may wisely give this item a place in their reports in the interest of character building.

The rule for Bible reading in the schools of Philadelphia is as follows:

At the opening of each session of the schools at least ten verses of the Bible shall be read, without note or comment, to the pupils by the principal, or, in his or her absence, by one of the assistants. A suitable hymn may also be sung.

Of the 50 reports recently received from city and county superintendents in the State of Pennsylvania, 41 state that the Bible is read in all their schools, 1 in all but the primary, 4 that it is read in many of them, and 5 that it is not read at all.

These reports show also that Bible reading has been a custom from time immemorial in most of the schools. Only 2 state that it has never been read in them. Few report it as a modern custom three, five, ten, fifteen, twenty, and twenty-five years old. Many schools have special rules requiring the reading; some, the unwritten law of Christian community; others, custom, public sentiment, inclination of teachers, etc.

Maine, with her supreme court decision; Massachusetts, with her model State law; Rhode Island, with her watchfulness for the morality and virtue of teachers and pupils; New York, with her law forbidding the exclusion of the Scriptures; Pennsylvania, with her requirement that Bible reading should be reported by all teachers; these, and all the other States of the North Atlantic Division, are in accord with the great jurist, Rufus Choate, who declared:

We would have the Bible read not only for its authoritative revelations and its commands and exactions, obligatory yesterday, to-day, and forever, but for its English, for its literature, for its pathos, for its dim imagery, its sayings of consolation and wisdom and universal truth.

SOUTH ATLANTIC DIVISION.

DELAWARE.

Hon. C. C. Tindal, State superintendent of schools, Dover, Del., writes:

I think I am safe in saying that Bible reading at opening of school is well-nigh or quite universal in Delaware schools.

A loyal spirit of confidence in Bible principles as essential to good citizenship has led her to honor the Scriptures from her earliest colonization. One qualification to be possessed by every officer of the State, required by her first constitution, was belief in the inspiration of the Holy Scriptures.

Digitized by Google

MARYLAND.

The superintendent of schools, Baltimore, Md., writes as follows:

The Bible is read daily in our schools; the Lord's Prayer is also recited. I inclose a copy of the rule which has been in force for over thirty years:

"Each school, either collectively or in classes, shall be opened by the reading of a chapter or part of a chapter in the Holy Bible and the use of the Lord's Prayer. The Douay version may be used separately by those pupils who prefer it."

The Bible has been read in all the schools in the city of Frederick for twenty years or more. Westminster has no Bible reading in her public schools.

THE DISTRICT OF COLUMBIA.

On the subject of Bible reading and moral instruction the city of Washington has the following rule:

32. They (teachers) shall practice such discipline in their schools as would be exercised by a kind and judicious parent in the family, always firm and vigilant, but prudent. They shall endeavor, on all proper occasions, to inculcate in their pupils truthfulness, self-control, temperance, frugality, industry, obedience to parents, reverence for the aged, forbearance toward the weak, respect for the rights of others, politeness to all, kindness to animals, desire for knowledge, and obedience to the laws of God; but no teacher shall exercise any sectarian influence in the schools.

The opening exercises in every school shall consist of reading by the teacher, without note or comment, a portion of the Bible, repeating the Lord's Prayer at the option of the teacher, and appropriate singing by the pupils.

VIRGINIA.

The following words of George Washington fittingly introduce the report received from his native State:

Of all the dispositions and habits which lead to political prosperity, religion and morality are indispensable supports. In vain would that man claim the tribute of patriotism who should labor to subvert these great pillars of human happiness, these firmest props of the duties of men and citizens. The mere politician, equally with the pious man, ought to respect and to cherish them. A volume could not trace all their connection with public and private felicity. Let it simply be asked, Where is the security for property, for reputation, for life, if the sense of religious obligation desert the oaths which are the instruments of investigation in courts of justice? And let us with caution indulge the supposition that morality can be maintained without religion. Whatever may be conceded to the influence of refined education on minds of peculiar structure, reason and experience both forbid us to expect that national morality can prevail in exclusion of religious principle. It is substantially true that virtue or morality is a necessary spring of popular government.

Hon. John E. Massey, State superintendent of public instruction, Richmond, Va., writes that he believes the Bible to be read in nearly all the Virginia schools; that this has been the custom since their organization.

Richmond reports the Bible as read in all her schools since their establishment. Manchester and Roanoke report fully observed rules requiring Bible reading. The rule in Roanoke specifies reading some portion of Scripture, the singing of a suitable hymn, and repeating the Lord's Prayer. No exposition allowed.

The Bible is read in all the schools of Staunton also. Two others report the custom as general, but not universal.

Perhaps the position of superintendent of schools in Virginia can not be more correctly expressed than by Bushrod Rust, superintendent of schools, Roanoke, Va. Mr. Rust writes:

I am strongly opposed to setting aside the dear old Bible as it stands for all the books in Christendom. * * * I believe in having the entire work at hand and in reading such selections as would "establish our youth in habits of truth, purity, uprightness, unselfishness, and goodness." I believe in being absolutely nonsectarian in and around our schools, and at the same time I would have all our

Digitized by Google

teachers be godly men and women, exemplifying all the graces of the Christian character in their daily lives before the pupils. This would tend to the building of high character and good citizenship.

WEST VIRGINIA.

The secretary of the State department of free schools reports that the Bible has been read in part of the schools of the State since 1863. There is no State law on the subject of Bible reading in the public schools of West Virginia, but on April 6, 1893, her supreme court decided that such reading should not be excluded. Thirteen reports have been recently received, four from her cities. In two of these it is stated that the Bible is read in all of the schools every day. In the other two it is read at option of teachers, and has been since the organization of the schools. Of the 8 county superintendents, 4 report Bible reading in all the schools of the county, excepting the high school in one county. Of the other 4, 1 reports the Bible as read in 25 per cent of the schools, saying that formerly teachers had done very little along that line, but at present the interest is increasing. A second, that the custom, although having been practiced for twenty-five or thirty years, is at present discontinued. The third states that it is read at the option of the teacher; that for twelve years it was read in all the schools under a requirement made when the free-school system was organized.

NORTH CAROLINA.

Hon. John C. Scarborough, State superintendent of public instruction, Raleigh, N. C., writes:

In our town and city graded schools, supported by local taxes as a supplement to the fund regularly apportioned to the town or city, the Bible is generally read, either in opening or at some other time, generally, however, at opening, the superintendent or principal in charge offering a short prayer or repeating the Lord's Prayer in concert with other teachers and pupils. * * * There is no rule about it, except as the custom of reading the book makes it a rule.

Superintendent Scarborough states further:

The question of reading the Bible in the public schools of North Carolina has never been mooted or discussed in the State. Many public school teachers read it, and have it read, sometimes as a part of a short exercise at opening, sometimes as a reading lesson selected by the teacher, the whole school, or so many as can read, reading alternate verses or passages. It depends entirely on the inclination of the teacher in charge.

One county examiner writes that the Bible is read in about 50 per cent of the schools. That the custom has been growing for twenty years. Another, that the Bible is more generally read now than at any former time. The remaining five, from whom special reports are received, state that the Bible is read in all their schools.

SOUTH CAROLINA.

Hon. W. D. Mayfield, State superintendent of schools, Columbia, S. C., writes:

There is no law for or against reading from the Bible in our schools. Such teachers as desire to do so read from it as they may choose.

Twelve officers report Bible reading under their jurisdiction. Nine of these state that it is read in all of their schools. It has been read in the schools of Charleston, the chief city of the State, for the last thirty-five years. Of the remaining five, two county superintendents state that the Bible is not generally read. A third, that the custom is quite common, but not universal, as it should be, and the fourth states that it has been generally read, but not regularly, for the last thirty-five years. The fifth, that it is read in part of the schools.

Thomas S. Grimké, the South Carolina statesman and philosopher, wrote of the harmony of our civil institutions with the Bible as follows:

Digitized by Google

If ever a political scheme resembled the divine government it is ours, where each exists for the whole and the whole for each.

GEORGIA.

Hon. G. R. Glenn, State school commissioner, Atlanta, Ga., writes:

Under our public school laws the Bible can not be excluded from our schools. The teacher is left to use the Bible as she may see fit. I am glad to say that a great many of our teachers open the school with some sort of religious exercises, sometimes reading from the Bible.

The Bible is read in large numbers of the public schools as far back as remembrance reaches. Of the 12 reports received from Georgia, 6 state that the Bible is read in all the schools and the other 6 state that it is read in part of them.

FLORIDA.

Hon. William N. Sheats, State superintendent of public instruction, Tallahassee, Fla., writes:

No data published in regard to Bible reading in the schools. There is no law prohibiting it, and most Christian teachers read short lessons from the Bible and open their schools with prayer daily.

Of 4 reports received from other school officers, 1 states that Bible reading in all the schools has always been the custom under a school board rule requiring it. A second reports reading of Bible in the county schools. The other 2 state that while Bible reading may not be universal the practice is and has been generally observed in all their schools since organization. The rule for Bible reading adopted by the board of instruction for Osceola County is as follows:

SEC. XI (p. 10). The reading of the Bible and short devotional exercises of a nonsectarian character at the opening of the school are hereby encouraged. Also the reading occasionally of the Declaration of Rights as set forth by the constitution of the State of Florida and the Constitution of the United States.

The South Atlantic Division has Bible reading generally in its schools. The largest cities observe the rule in all their schools.

SOUTH CENTRAL DIVISION.

KENTUCKY.

There is nothing in the law of Kentucky to enjoin or forbid the reading of the Bible in schools. The teaching of infidel or sectarian doctrine is forbidden.

Fourteen replies from county and city superintendents in this State give the following information: Eight of them report the Bible as read in all the schools under their supervision, the custom having been observed for twenty-five, thirty, or more years—ever since the organization of the schools. In one of them it has been the custom for three years only; in another two years. Two of these schools have rules requiring Bible reading. In others it is optional. Louisville, Kentucky's largest city, has the Bible read in every school. There is a rule requiring such reading. Four others report that the Bible is read in part of the schools. Two report no Bible reading, the superintendent of one of which expresses deep regret that such is the fact.

TENNESSEE.

This State sends two reports, one of which assures us of Bible reading in all the schools since their organization. The superintendent writes:

Should the Bible be removed from our schools I would not superintend or instruct in them. The Bible is our rock of public safety.

The other superintendent reports Bible reading in part of the schools and states that a rule will be made this summer requiring it of all teachers.

Digitized by Google

ALABAMA.

Five reports are received from Alabama. Three of them, including one from the capital of the State, report that Bible reading has been the custom in their schools since organization. The fourth has no data on the subject. The fifth states that Bible reading is not customary.

MISSISSIPPI.

The constitution of this State requires that the free enjoyment of all religious sentiments shall be held sacred.

The rights hereby secured shall not be construed to justify acts of licentiousness injurious to morals or dangerous to the peace and safety of the State, or to exclude the Holy Bible from use in any public school of this State.

Of the two reports received, one states that the Lord's Prayer is used; another that the Bible is read occasionally and that vigorous efforts will be made to have "Readings from the Bible"[1] introduced this fall.

LOUISIANA.

The constitution of Louisiana has several sections forbidding the connection of schools with any sectarian enterprises. The one report received from that State informs us that there is no local rule on the subject of Bible reading, and that the Bible has not been read during the last six years. From this report the custom of the schools of the State can not be ascertained.

TEXAS.

Hon. J. M. Carlisle, State superintendent of public instruction, Austin, Tex., writes that the state department has not collected any special statistics on this subject. He regrets his inability to aid in the preparation of this report.

Seven local reports have been received. In Houston the Bible is read in all the schools under a law requiring such an exercise. One reports some Bible reading, but no system or regularity. Another states that the Bible is read in the third and fourth grades in course of ethical reading. The fourth writes that it is read regularly mornings in high schools and has been since they were organized. The remaining three report no Bible reading. Two have no rule on the subject, and one of them has a prohibitory regulation.

ARKANSAS.

In the bill of rights of the State of Arkansas, amended in 1868, she directs her general assembly to * * * "encourage schools, because 'religion, morality, and knowledge' are 'essential to good government,'" etc. The constitution of the State (1874) maintains free schools, because "intelligence and virtue are the safeguards of liberty." Hon. Junius Jordan, State superintendent of public instruction, Little Rock, Ark., writes that the State constitution has no rule on the subject of Bible reading. That the custom has been observed in part of the free schools for twenty-five or more years—ever since such schools were organized. Three other reports received state that the schools have no rule on the subject; that the Bible is read in part of them at option of the teacher.

NORTH CENTRAL DIVISION.

OHIO.

The concluding sentence of the seventh section of the bill of rights in the present constitution of the State of Ohio is nearly identical with the article concerning

[1] A book of selections from the Bible, prepared under the auspices of the Chicago Woman's Educational Union.

Digitized by Google

schools in the ordinance of 1787; and by the general custom of Bible reading throughout the State this is indicated as the book from which the religion and morality required by the State is to be found.

Reports are received from 53 counties and cities in Ohio. Thirty-one of these state that the Bible is read in every school (29 of them report the custom as observed for many years, ever since the establishment of the schools, and for so long a time that "the memory of man runneth not to the contrary)." In one instance it is reported as having been observed ten or fifteen years. One reports a rule on the subject. Three report an unwritten law favoring Bible reading. The request of the superintendent operates as law in another locality. Of the remaining 22, two have insufficient data, but believe that the Bible has been read for at least five years in all the schools. Another states that teachers are requested to read portions of the Bible regularly, and that most of them do. Four more state that most of the schools have Bible reading. Two more report reading in part of the rooms. Four others say that the Bible is not generally read in the schools under their care. Two report the reading only of the selections from the Bible found in their school readers. Two report very little, if any, Bible reading, and 3 report none.

One superintendent writes:

All our schools, from the first primary through the high school, have the Bible read, and a short prayer, or the Lord's Prayer repeated, accompanied by some appropriate song. We thoroughly believe in it, and we know that it has a good influence on our children.

INDIANA.

Indiana has the following law on the subject (1865, p. 3, approved and in force March 6, 1865):

4493. *Bible.*—The Bible shall not be excluded from the public schools of the State. (167.)

The following note is of interest in this connection:

NOTE.—The Bible, without note or comment, is installed in the common schools of Indiana. Its continuance as a moral class book in these nurseries of her future citizens will as surely mark the period of her prosperity and grace the zenith of her glory as its exclusion would prove the precursor of her decline, the herald of her shame.—(Mills, superintendent.)

Reports received from 31 county and 26 city superintendents of schools are as follows: Seven county and 11 city superintendents report that the Bible is read in all their schools. Twenty-four other school officers report that it is read in nearly all their schools. Three report no Bible reading. All the others report Bible reading at the option of teacher. Six of the city boards have rules concerning Bible reading, 1 of which we quote.

GREENSBURG RULE.

SEC. 3. *Opening of the schools.*—The school shall be opened in the morning with reading of the Bible and prayer or singing; but the first shall in no case be omitted.

Several superintendents of schools in Indiana are using the book "Readings from the Bible," and like it very much.

ILLINOIS.

Hon. Samuel L. Inglis, State superintendent of public instruction, Springfield, Ill., writes—

The constitution of the State neither requires nor forbids the reading of the Bible.

Of the 71 reports received from Illinois city and county public school superintendents, 7 report Bible reading regularly in all their schools. Four more state

Digitized by Google

in nearly all. Twenty-eight others write that it is read in part of their schools at the teacher's option. Twelve report no Bible reading. A few have written rules requiring Bible reading. Others observe an unwritten law, based on custom or the will of the teacher.

On the general subject of Bible reading, one superintendent writes:

All of our public schools have been opened daily with devotional exercises, and nearly all of our teachers' meetings have been opened with prayer.

Another—

Teachers are requested to open morning sessions with appropriate songs, the reading of a Bible selection, and prayer. They are to make no comments in these or other school exercises of a sectarian character, but reverence for God and respect for holy things must be inculcated and enforced in every school.

MICHIGAN.

Of the 42 reports received from county and city superintendents in Michigan, 17 report the Bible read in all their schools; 5 more report it as read in nearly all or quite generally; 11 more as read in part of the schools; 9 report that the Bible is not read at present, but in 3 of these it was formerly read. The custom of Bible reading in Michigan dates back to the organization of the schools.

Detroit has adopted "Readings from the Bible" for use in her public schools.

In December, 1898, the supreme court of Michigan rendered a decision favorable to Bible reading in the public schools.

WISCONSIN.

Hon. J. Q. Emery, State superintendent of public schools, Madison, Wis,, in a circular letter dated April, 1896, to superintendents of schools, and town and district clerks, states—

The supreme court has decided that sectarian instruction, within the meaning of the constitution, is instruction in religious doctrines which are believed in by some religious sects and rejected by others.

Fifty-three reports have been received from city and county superintendents. All indicate a loyal observance of the construction placed upon the decision of the supreme court. A careful reading of this decision seems to show that the judges make an exception to the general rule of excluding the Bible, which would permit the use of some book of suitable Scripture selections. The passage referred to is found on page 17, section 5, in the pamphlet containing the decision of the supreme court of Wisconsin concerning the district board of school district No. 8, of the city of Edgerton. It is as follows:

Furthermore, there is much in the Bible which can not be justly characterized as sectarian. There can be no valid objection to the use of such matter in the secular instruction of the pupils. Much of it has great historical and literary value, which may be thus utilized without violating the constitutional prohibition. It may also be used to inculcate good morals—that is, our duties to each other—which may and ought to be inculcated by the district schools. No more complete code of morals exists than is contained in the New Testament, which reaffirms and emphasizes the moral obligations laid down in the Ten Commandments. Concerning the fundamental principles of moral ethics, the religious sects do not disagree.

The following sentiment was prepared for the use of the Wisconsin schools, in their patriotic exercises in May, 1896:

The best citizen, the best patriot, the best son of his country, is he who gives the best manhood to his country. He is the man who writes upon his nature the Ten Commandments and the Nine Beatitudes.

MINNESOTA.

Hon. W. W. Pendergast, State superintendent of public instruction, St. Paul, Minn., writes—

I have to some extent examined the book entitled "Readings from the Bible," and think the selections have been made with the greatest of care and the best of judgment.

Three reports concerning Bible readings have been received from the Minnesota superintendents, in one of which it is said that the Bible is read in part of the schools, and two which report no reading.

The city of Minneapolis has adopted "Readings from the Bible" for use in her schools.

IOWA.

The school law of Iowa states (sec. 1764, p. 57)—

The Bible shall not be excluded from any school or institution in this State, nor shall any pupil be required to read it contrary to the wishes of his parent or guardian.

Hon. Henry Sabin, superintendent of public instruction, Des Moines, Iowa, writes—

The great fault in the education of to-day is undoubtedly the tendency to crowd the intellect and to neglect nearly everything which tends toward moral training. I think the selections are most judiciously chosen and that the book is well adapted to carry out the praiseworthy design. I can not see how it can be objectionable to anyone who has the welfare of the children at heart.

Twenty reports from county and city superintendents have been received. Seven report the Bible read daily in all their schools; 1 states that it is read in the high and grammar school grades; 3 that it is read in nearly all of the schools; 6 report regular reading in part of them; 1 reports the Bible read at irregular intervals; 2 report no Bible reading; 3 boards report special rules on the subject as follows:

North Des Moines.—A recognition of the divine character of God, and of the accountability of man, is expected of all the teachers, particularly in the brief opening exercises of each day; but all matters of a sectarian or partisan character shall be excluded from the schools.

Fort Dodge.—Opening exercises shall be held in all the departments, and may consist of Bible reading without note or comment, prayer, music, or other appropriate exercise, at the option of the teacher.

[Oskaloosa School Manual, p. 43, secs. 50 and 52.]

SEC. 50. They [teachers] shall open the morning session in each school with reading from the Bible, followed by prayer or appropriate singing, at the option of the teacher.

SEC. 52. *Sectarian influence.*—Teachers shall not exercise any sectarian influence in school; but they shall endeavor at all proper times to impress upon the minds of their pupils correct principles of morality and virtue, a sacred regard for truth, habits of sobriety and industry, love for God and man.

In addition to the cities whose rules are quoted above, replies were received from Sioux City, Burlington, Muscatine, Ottumwa, Marshalltown, and others. These show that the custom of Bible reading extends back to the organization of the schools.

One county superintendent writes—

We find in the Bible beautiful literature, excellent teachings, and the foundation of our discipline.

MISSOURI.

Hon. John R. Kirk, State superintendent of schools, St. Louis, Mo., writes—

There is nothing in the school law of this State with reference to Bible reading in the public schools. The matter is left entirely to the board of directors of each district to settle according to the wishes of the community.

Digitized by Google

Twenty-six reports from city and county superintendents acquaint us with the following facts: Six report Bible reading in all their schools; 1 reports it in most of them; 1 has no data; 11 report Bible reading in part of their schools; 7 report no Bible reading. Returns show that the Bible has been read in many localities since the organization of the schools. Others state that the custom is growing, and that the Bible is read more now than ever before; 4 state that the Bible has never been read in their schools.

One superintendent writes—

Your enterprise deserves the greatest encouragement from educators. I have received and examined carefully the book "Readings from the Bible," and think such a book should be in every school course as a supplementary reader. Every boy and girl should know it well.

Another states that—

Each schoolroom acknowledges God in some way every morning. * * * Character building is an important factor with us.

NORTH DAKOTA.

Hon. Emma F. Bates, State superintendent of public instruction, Bismarck, N. Dak., sends the following from the revised code of 1896, section 754:

The Bible shall not be deemed a sectarian book. It shall not be excluded from any public school. It may, at the option of the teacher, be read in school without sectarian comment, not to exceed ten minutes daily. No pupil shall be required to read it, nor to be present in the schoolroom during the reading thereof, contrary to the wishes of his parents, guardian, or other person having him in charge. Moral instruction, tending to impress upon the minds of the pupils the importance of truthfulness, temperance, purity, public spirit, patriotism, and respect for honest labor, obedience to parents, and due deference to old age shall be given by each teacher in the public schools.

One superintendent reports Bible reading in part of the schools.

The legislative provision for the establishment and maintenance of schools is founded upon the fact of the necessity of a high degree of intelligence, patriotism, integrity, and morality on the part of every voter in a government by the people.

The superintendent understands that in order to secure the highest educational results in children, parents must be in intelligent cooperation with all efforts to improve the pupils. Hence, June 26, 1896, was designated as parent's day, to be observed throughout the State.

The exercises upon that day consisted of select songs, recitations, essays, dialogues bearing upon home life, its beauties and duties, the child in the home, the mother, the father, the family. * * * The home is the unit of government, and for the perpetuity of holy home life, and for the right education of the children of those homes our nation was established and our public-school system is maintained.

SOUTH DAKOTA.

Hon. George N. Parker, deputy superintendent of public instruction, Pierre, S. Dak., writes:

We send you a copy of the school law of 1891, on page 44 of which you will find all the law we have upon the reading of the Bible in the public schools. * * * We have examined the publication (Readings from the Bible) you mention, and we are much pleased with it.

[South Dakota School Law, p. 44, sec. 18.]

No sectarian doctrine shall be taught or inculcated in any of the schools of the corporation, but the Bible, without sectarian comment, may be read therein.

Thirteen reports are received from city and county superintendents of South Dakota; 5 report that the Bible is read in all the schools and 8 that it is read in part of them. The State law is the only rule on the subject.

Digitized by Google

NEBRASKA.

Hon. H. R. Corbett, State superintendent of schools, Lincoln, Nebr., writes:

The State of Nebraska has by its laws and the regulations of the department of education always encouraged moral culture in its public educational system. The Bible is generally read in our schools. I have, however, no carefully compiled data showing the exact extent or nature of the efforts in this direction.

I have examined the book entitled Readings from the Bible, and regard it as one of the most important educational publications of recent times. It will certainly facilitate the introduction of Scripture reading into many schools where such exercises have heretofore been impossible.

From the 28 reports received from city and county superintendents, 13 state that the Bible is read in all the schools; 2 more have not complete data, but believe it to be read in most of their schools. Generally speaking, writes one, the Bible is read throughout the county. One states that it is read in nearly all of the schools; 8 report Bible reading in part of them—in some counties more, in some less. The Bible has held an honored place in the educational system of Nebraska since the organization of their schools.

One superintendent of schools answers the questions in regard to Bible reading in the negative. She writes:

I read these questions aloud to our teachers in attendance at the institute, and I think if you ask us the same questions next year I can answer yes.

Another speaks of introducing "Bible readings" into his schools during the coming year.

Another writes:

I have examined Readings from the Bible with much care and interest in view of the discussion now going on along this line, and I must certainly say that it seems to me the work undertaken and presented in this little volume has been admirably done.

KANSAS.

Hon. E. Stanley, State superintendent of public instruction, Topeka, Kans., writes:

We have but little law bearing upon the subject of Bible or moral instruction in the common schools of the State. * * * I like your little book, Readings from the Bible, selected for schools, very much. I think the selections are very well chosen.

Thirty-four reports from county and city superintendents on the subject of Bible reading have been received. Seven state that the Bible is read in the opening exercises of all their schools, another thinks this is done, 2 more report Bible reading in most of the schools, and 2 report such reading in many. Seven report Bible reading in part of their schools, and 5 report it as not being read. The custom of Bible reading has been general since the schools were organized. Three superintendents report school laws on the subject. Others say custom is the law in their localities.

THE WESTERN DIVISION.

MONTANA.

Hon. E. A. Steere, State superintendent of public instruction, Helena, Mont., states that there is no rule in the constitution of Montana concerning the Bible; that it is read in a few of the schools. He expresses his approbation of Readings from the Bible as follows: "I am highly pleased with its contents."

A report from a local superintendent in Montana states that the Bible is not read in his schools.

Digitized by Google

WYOMING.

Hon. Estelle Reele, State superintendent of public instruction, Cheyenne, Wyo., writes:

There is no provision whatever in the Wyoming school laws relative to the matter [Bible reading], it being left entirely to local school boards, or in almost all cases to the individual teachers. * * * I have examined the copy of Readings from the Bible sent me and like it very much.

Eight reports from county and city superintendents are received. One states that the Bible is read in all schools; another that some teachers read it regularly; a third that it is occasionally read; one expresses sorrow that the custom is not universal; one states that in the primary grade portions of the Bible are learned and repeated; another reports no Bible reading at present, but writes that it was formerly read; two report no Bible reading.

COLORADO.

Hon. A. J. Peavey, State superintendent of public instruction, Denver, Colo., writes:

Have examined the Bible readings and consider it very valuable. We have no statistics about Bible reading.

Twenty-four reports from city and county superintendents have been received. Four of these state that the Bible is read in all their schools; 11 report reading in part of the schools; 9 report no reading. One of these superintendents expects to put Readings from the Bible into all the schools of his county this coming year. Another suggests the use of it for supplementary reading. One writes as follows:

I am in happy accord with the movement, and hope to see Bible reading practiced for morning exercises in all our schools of this county. I shall take pleasure in directing the attention of the institute to this very important subject.

UTAH.

Hon. John R. Park, State superintendent of public instruction, Salt Lake City, Utah, writes:

While morality is taught and inculcated in all of the public schools of this State, the Bible is not read in any of them. The belief seems to be quite widespread here that moral teaching in the public schools should be wholly nonsectarian, and many believe it to be impossible to introduce the Bible into the schools without at the same time removing one of the strongest safeguards against sectarianism.

Eight reports from city and county superintendents verify the information contained in Mr. Park's letter. One of them states that the Bible had been read at option of teacher for twenty years, until 1896. Another that it had been read for thirty-eight years, ending in 1885.

NEVADA.

Hon. H. C. Cutting, State superintendent of public instruction, Carson City, Nev., writes:

Although there is not one school in the State where the Bible is read, efforts at moral training are made in all.

Two reports received from local superintendents are in harmony with that of the State superintendent.

IDAHO.

Hon. C. A. Forseman, State superintendent of public instruction, Boise City, Idaho, writes:

Our school law prohibits any reading of the Bible, or at least that is the recognized construction.

Eight county superintendents verify the report of their chief.

WASHINGTON.

Hon. C. W. Bean, State superintendent of public instruction, Olympia, Wash., forwards a copy of the attorney-general's opinion regarding the reading of the Bible in the public schools of the State, dated September 19, 1891. Four reports from county and city superintendents are received. Each states that the Bible is not read, being under ban of attorney-general's ruling. Two state that it was read in their schools previous to 1891. One writes:

I believe the day will come when the Bible may be read and taught.

OREGON.

Hon. G. M. Irwin, State superintendent of public instruction, Salem, Oreg., writes that the Bible is not generally read in the schools of the State. Ten reports are received from county superintendents; 4 state that there is no Bible reading in their counties; the others say that it is read in a few schools in each of their counties. There is no rule in Oregon prohibiting the reading of the Bible, and in some schools it is reported to have been read for forty-eight years.

CALIFORNIA.

Hon. Samuel T. Black, State superintendent of public instruction, Sacramento, Cal., refers the questions relating to Bible reading in the schools to the county superintendents of his State. Twenty-six replies to these questions have been received; 19 of these report no Bible reading; 6 understand section 8 of Article IX of the constitution of 1879 to be opposed to such reading; 7 report Bible reading in part of the schools; 1 writes that it is read for its literary value, stating that many of its stories are required to be told and read in course of study.

One superintendent writes as follows:

I am much pleased that something is being done in this direction. I have read the notices that have appeared, from time to time, in the papers with reference to the preparation of a book of extracts from the Bible. I shall surely try to have it introduced into our schools.

Reports of State superintendents are not included above. Superintendents having "no data" are not counted. Three-fourths of superintendents report Bible reading in part or all of the schools under their supervision. The recapitulated laws of nine States concerning Bible reading in schools are as follows:

Massachusetts.—The school committee shall require the daily reading in the public schools of some portion of the Bible, without written note or oral comment, etc.

Pennsylvania, Decision No. 114.—The Scriptures come under the head of text-books, and they should not be omitted from the list.

New Jersey.—It shall not be lawful for any teacher, trustee, or trustees to introduce into or have performed in any school receiving its proportion of the public money, any religious service, ceremony, or forms whatsoever, except reading the Bible and repeating the Lord's Prayer.

Georgia.—The county board of education shall prescribe from time to time what text-books and books of reference shall be used in the common schools of the county; provided the Bible shall not be excluded from the common or public schools of the State.

Mississippi.—The constitution of this State requires that the free enjoyment of all religious sentiments shall be held sacred. "The rights hereby secured shall not be construed to justify acts of licentiousness injurious to morals or dangerous to the peace and safety of the State, or to exclude the Holy Bible from use in any public school of this State."

Indiana.—The Bible shall not be excluded from the public schools of the State.

Iowa.—The Bible shall not be excluded from any school or institution of this State, nor shall any pupil be required to read it contrary to the wishes of his parent or guardian.

North Dakota.—The Bible shall not be deemed a sectarian book. It shall not be excluded from any public school, etc.

South Dakota.—No sectarian doctrine shall be taught or inculcated in any of the schools of the corporation; but the Bible, without any sectarian comment, may be read therein.

Educators connected with our public schools recognize the truth of which the poet sings:

"If half the power that fills the world with terror,
If half the wealth bestowed on camps and courts,
Were given to redeem the human mind from error
There were no need of arsenals or forts."

SELECTED BIBLE READINGS.

The need of appropriate selections from the Bible to be read in schools is obvious. Generally the choice rests with the teacher, who would undoubtedly in many instances be glad to have the assistance of a book of selections that would economize time and effort. It might be possible also, by means of judicious selections, to meet the conflicting notions that sometimes result in the total elimination of the Bible from schools.

At the instigation of Prof. David Swing, of Chicago, the Woman's Educational Union undertook to secure the preparation of such a book, and the result is the little volume Readings from the Bible Selected for Schools, referred to several times in the preceding report. As stated by the society, the book consists of selections from the Old and New Testaments of the Bible, made by ten clergymen, namely, Cardinal Gibbons, Prof. Herrick Johnson, Rev. Theodore N. Morrison, President Charles A. Blanchard, Dr. H. W. Thomas, Rev. Josiah Strong, Dr. F. W. Gunsaulus, Dr. J. H. Barrows, Rev. Theodore F. Wright, and Dr. Thomas C. Hall.

These selections were edited by a committee of four persons, named by Prof. David Swing (together with a fifth, who did not act) in a letter written April 3, 1894. The committee consisted of Hon. William J. Onahan, Dr. John Henry Barrows, Hon. Charles C. Bonney, and Mrs. E. B. Cook. Rabbi Joseph Stolz, Prof. Henry G. Moulton, and others also rendered valuable assistance to the committee.

President William R. Harper, of the Chicago University; President Henry Wade Rogers, of the Northwestern University; President John M. Coulter, at that time of the Lake Forest University; Dr. M. M. Mangasarian, and others reviewed the manuscript, with commendations and suggestions.

A feeling that the work was both patriotic and philanthropic seemed to inspire those who interested themselves in it. The publishers also did their part with a desire to serve the schools in the most helpful manner possible.

The book received a hearty welcome from the evangelical clergymen of Chicago, who in mass meeting assembled spoke eloquent words for it and voted their approval of it. The Chicago metropolitan press, with great unanimity, expressed the popular sentiment of approbation through their columns, both editorially and otherwise.

It was also the subject of favorable notice by educators and religious journals throughout the country.

The editorial committee bear hearty testimony to "the intelligence, prudence, and wise and painstaking zeal with which the work was pursued by the Chicago Woman's Educational Union, under the faithful and earnest leadership of its president, Mrs. Elizabeth B. Cook."

As to the purposes of the book, Hon. W. J. Onahan, a distinguished Roman Catholic layman and chairman of the editorial committee, wrote:

> We do not wish to outline any scholar's religious belief. We simply want to lay the foundation for a belief of some kind. Personally, I should regret not having done what I could to make it impossible for a child to grow up in ignorance of God. Let them grow up in what church they may, but let them have a belief of some kind.

Dr. Barrows, also of the committee, says:

> It is historically certain that the best elements of our institutions sprung from the Bible. * * * There is no sectarian bias for this movement. Only the highest results, dear alike to Catholic, Protestant, Israelite, and even agnostic, are desired and sought for. There is surely no agnostic in Chicago whose judgment has the weight of Professor Huxley's, and he knew of no substitute for the Bible equal in value to the Hebrew and Christian Scriptures.

Hon. C. C. Bonney, the third member of the committee, writes as follows of the legal aspect of the case:

> In contemplation of law, no injury is possible as the result of reading the Bible in the public schools. In contemplation of law, the exclusion of the sacred Scrip-

Digitized by Google

tures from the public schools is an indignity to the sovereign authority and a violation of the compact of 1787. In contemplation of law, such exclusion is a breach of the trust on which the school funds are held and an injury to all who are interested in the schools. The bane of American education is the idea that mere knowledge will make useful men and women.

Religion, morality, and knowledge all being necessary to good government and the happiness of mankind, they should all be taught in the public schools, where the children and youth ought to learn the virtues we desire to have them practice when they arrive at mature years.

The selections used in this book were made, as already stated, by clergymen of different denominations. They were carefully arranged in form of a trial book of selections, which, after being approved by the Educational Union, was submitted to clergymen, educators, ethical teachers, and leaders of the unchurched masses for revision, and their suggestions have been considered by the committee having this work in charge.

It is obvious that every possible effort has been made to avoid sectarian bias in this compilation, while maintaining the highest literary and ethical standard.

II.—THE BIBLE IN THE PUBLIC SCHOOLS.

[From an address by Dr. A. P. PEABODY, of Harvard University.]

We are asked to exclude from our schools the Bible, and, by parity of reasoning, all instruction drawn from or to the Bible. What is this, in the first place, but garbling and truncating history? There are important, momentous portions of the world's history of which the Bible is the only manual. The Jewish people have exercised an influence upon mankind far exceeding that of all other ancient nations, and outside of the Bible how scanty and fragmentary is all that can be known or taught concerning this people! Christianity is the most important factor in the history of mankind. It has been the inspiration and the mold of modern civilization and has supplied all the elements that distinguish it from the culture of the ancient world. It has modified all political and social institutions. It has given birth to philanthropy in its protean forms. It has created home, with its unnumbered amenities and charities, while the classic languages have not a word that corresponds to our idea of home. It has reversed the scale of the virtues, attaching supreme importance to some that had not even a name, and throwing into the background others that arrogated to themselves the exclusive title of virtue. Shall our children be forbidden to learn what Christianity is in its own universally acknowledged manual? Jesus Christ, whatever be his actual character—whether he be or not, as I believe him to be, all that his biographers claim for him—is so far the most influential personage that has ever appeared in the history of the world. To exclude his life and character from the narrative of human existence for the last nineteen centuries is an immeasurably more gross, foolish, and stupid mutilation of history than it would be to omit the names and doings of Washington, Franklin, and Adams from American history. Shall not our children be permitted to learn what he was from the only authentic record of his person, words, and works? If history is to be one of our school studies, I know not how it is to be taught if the Bible and its contents be excluded.

There are other departments of education in which the Bible is no less essential than in history. If moral philosophy is to be taught at all, I suppose that none would deny that it is distinctively Christian ethics in which our children are to be trained.

But if Christian ethics be taught, shall they be taught as they are interpreted—and it may be distorted and misrepresented—by modern theorists, or as they fell from the lips and are embodied in the life of the divine teacher?

Again, in our school education we are laying a constantly increasing stress on the culture of the taste and imagination in literature. We deem it of no little

Digitized by Google

importance that our children and youth should become conversant with the best models of composition, should learn to admire what is truly grand, and to love what is truly beautiful, and should thus, both in their choice of books and in their choice of words in speaking and writing, be under the guidance of a pure, refined, and cultivated taste. In this department who will dare dispense with the Bible? Leaving their religious worth out of the account, in a purely literary point of view I should feel myself bereaved of the choicest productions of human genius, of my highest inspiration and my most finished models, were you to blot out of my knowledge the Psalms of David, the parables of our Saviour, St. Paul's description of charity, his sublime chapter on the resurrection, the glorious vision of the Apocalypse, and many portions of sacred writ which transcend all other literature equally in the glow and fervor of their God-breathed thoughts, and in the sweetness, majesty, and grandeur of their diction.

We are by profession a Christian people. We recognize the great principles of religion, of Christianity, in the devotional services in our legislatures and our courts of justice, and in the use of oaths in every department of public administration. Shall our children be trained as citizens without the inculcation of those fundamental religious ideas which will impress upon them the significance of prayer and the dread solemnity of an oath?

* * * * * * *

The question virtually before us is not that of the use of the Bible in schools, but that of the permanence of our public schools as an institution. * * *

I have left myself little space to speak of the way in which the Bible should be used in schools. Of course it should not be made a mere class book, and should not be read indiscriminately. I would have it, in the first place, furnish the material for whatever devotional services there may be in the school. Such services are intrinsically proper, and apart from their religious worth they aid materially in the discipline of the school, by the relations of a more tender and sacred character which they create between teacher and pupils and among the pupils. But prayer in the teacher's own words may be sectarian or, what is fully as bad, may be suspected of being so. Far better is it then that prayer be offered in the comprehensive form given by our Saviour. To this, where it is found practicable, may be added the responsive reading of Psalms and other appropriate passages of Scripture, by teacher and pupils alternately, or of such scriptural liturgies of praise as might be prepared for that use. Where sacred music can be added, nothing could be easier, more pleasant to the ear and taste, or more edifying to the spiritual receptivity than the chanting of Psalms. Over and above such devotional exercises it should be left to the discretion of committees and teachers, and should depend on the grade and character of the school, whether additional direct use be made of the sacred volume.

Where all or the major part of a school are of an age to profit by such reading, I would have short lessons read by the teacher or one of the scholars, embracing the most instructive biographies and historical narratives of the Old Testament, the choicest specimens of Hebrew poetry, the principal parables and discourses of our Saviour, the leading incidents in His life, and some select portions of the apostolic epistles. For such purposes there are volumes of extracts for school use, well chosen and arranged, and easily accessible, or the teacher may exercise his own taste and judgment in the selection.

But what I would chiefly contend for and urge is, that the teacher be not only permitted, but expected, instructed, and encouraged to make free use of the Bible for any and every purpose for which he may find it available—for instruction in history, literature, morals, and the fundamental truths of religion; that it be a reference book, a standard work, a recognized authority in the school; that as the teacher has recourse to all other books within his reach for such help as they may furnish him in teaching, so should he have especial recourse to this exhaustless

Digitized by Google

manual of knowledge, human and divine, for whatever knowledge and wisdom he can draw from it for the pupils under his charge.

The problem of religious instruction in State universities is a serious one, and is attracting much earnest attention at the present time. One method of its solution is shown in the accompanying account of the work of Bible chairs at State universities under the auspices of the Christian Woman's Board of Missions. The office is indebted for the statement to the courtesy of Rev. Dr. Young, field secretary.

III.—The English Bible and State Universities.

[By Rev. Chas. A. Young.]

The Bible has been recognized all through our American history as the sheet anchor of our civil liberties and the source of our higher civilization. It was faith in the Bible which actuated the American Congress, when the Revolution was at its height, to issue an order for 20,000 copies of the Scriptures, side by side with appropriations for the purchase of gunpowder. The grant of public lands for the purpose of education in 1787 states that religion is "necessary to good government." That the religion of the Bible is implied may be inferred from the following statements of Presidents of the United States:

The studious perusal of the sacred volume will make better citizens. (Thomas Jefferson.)

In regard to the Great Book, I have only to say that it is the best gift which God has given to men. (Abraham Lincoln.)

So great is my veneration for the Bible that the earlier my children begin to read it the more confident will be my hopes that they will prove useful citizens of their country and respectable members of society. (John Quincy Adams.)

Hold fast to the Bible as the sheet anchor of your liberties; write its precepts on your hearts and practice them in your lives. To the influence of this book we are indebted for the progress made in civilization, and to this we must look as our guide in the future. (U. S. Grant.)

The more profoundly we study this wonderful book, and the more closely we observe its divine precepts the better citizens we will become and the higher will be our destiny as a nation. (Wm. McKinley.)

None of these Presidents were ecclesiastically inclined, yet all recognized the religion of the Bible as the basis of true citizenship. The Bible is the great textbook of civilization. As Daniel Webster said: "There is no solid basis for civilization but in the Word of God." Horace Mann wrote: "Our system earnestly inculcates all Christian morals; * * * it welcomes the religion of the Bible." Even Professor Huxley, certainly no pietist, says: "True science and true religion are twin sisters, and the separation of either from the other is sure to prove death to both." No scheme of intellectual equipment is complete which omits the study of the interpretations of life contained in the classic masterpieces of the world's best thought. Some knowledge of the literature of the Roman, Greek, German, English, and other peoples is essential to any adequate understanding of history. Strange as it may seem, the body of literature which we call the Bible—which is permeated by a healthful moralism and hopeful optimism, and judged by every canon of literary criticism is the most beautiful, fascinating, inspiring, and ennobling literature in the world, and which has exerted an unparalleled influence upon our best literature—has been almost totally neglected in our higher institutions of learning. Consequently, those who study the great lessons of life revealed in literature are properly expected to have some knowledge of Homer, Horace, Dante, Goethe, Shakespeare, and Milton, but are unfortunately almost totally ignorant of the literary worth of the Bible, the most important collection of books in the world. When, in addition to its superior literary merits, the ethical value of the history and literature of the Bible, which exceeds that of all

Digitized by Google

other literature combined, is taken into account, the absence of the literary study of the Bible in the curricula of our colleges and universities is indeed strange. The rising tide of interest in the Bible from the standpoint of history and literature, as well as from that of ethics and religion, is taking practical shape in the establishment of chairs in Biblical literature in many endowed denominational schools. The introduction of Biblical study in State universities, however, is attended with some difficulties. The reason of this is apparent. It has usually been regarded as impossible to teach the Bible except from the standpoint of theology, thus affording the instructor opportunity to force his peculiar denominational tenets upon students. The fear of sectarian prejudice has made the exclusion of the Bible from the curriculum seem the safer course. Again, the Bible has been viewed from the ecclesiastical standpoint, rather than from the standpoint of life and literature, history and ethics. This fact, owing to the separation of church and state, has perhaps had more influence than fear of sectarian bias in preventing the study of the Bible in State universities. It has been proved, however, that the Bible can be taught from the standpoint of history and literature, scientifically and without sectarian bias, and this fact has encouraged the establishment of Bible chairs at the seats of several State universities.

While the separation of church and state is a fundamental principle in American civilization, every informed person knows that we can not divorce our political life from our religious influence without the most disastrous consequences. Religious culture is essential to the highest and completest intellectual attainments. It was a recognition of the moral and spiritual needs of university students, whether church members or not, which prompted the Christian Woman's Board of Missions, an organization of Christian women with headquarters at Indianapolis, Ind., to undertake "the establishment of English Bible chairs for the purpose of giving religious instruction to students attending State universities." The method of coordinating religious instruction with the university studies is very simple and has proved eminently practicable. The instruction is provided by Christian people who are responsible for the expenses. Classes are arranged for all students who desire to study the Bible. This plan not only meets the needs of students preparing for Christian service in the ministry or the mission field, but affords opportunity for general religious culture to all. Dr. Richard T. Ely, of the University of Wisconsin, recommends the establishment of denominational dormitories around State universities, but having no legal connection with them.

THE ORIGIN OF THE BIBLE-CHAIR IDEA.

The present has its roots in the past. The unity of life pervades every realm of thought to-day. The idea of coordinating religious culture and intellectual development is not new. "Let us reason together saith the Lord." (Isaiah i, 18.) An early church father reminds us that in the Bible the tree of knowledge and the tree of life grow side by side. The charter of Harvard College, the first institution of learning on the continent of America, declared the object of the institution to be "the education of the English and Indian youth of this country in knowledge and godliness." In our State universities, however, the emphasis is placed almost exclusively upon intellectual development. Through the influence of Thomas Jefferson the University of Virginia was the first State university to invite religious denominations to plant their theological schools around it. In Jefferson's letter to Dr. Cooper, November 2, 1822, describing his plan of allowing independent schools of theology to be established in the neighborhood of the university, two things are very plain. (1) *His chief concern was to disarm prejudice* against an institution of "no religion." We who heartily accept the doctrine of the separation of church and state may not fully realize the bitterness of the prejudice which the father of the University of Virginia felt. (2) While Jefferson's chief concern was negative, it is also quite evident that, as to the positive work

Digitized by Google

"the different religious sects" might accomplish, he did not anticipate the teaching of the Bible from the standpoint of history and literature to *all* students irrespective of creed or calling. I give his letter as quoted in the History of Higher Education in Virginia.

In our university you know there is no professorship of divinity. A handle has been made of this to disseminate an idea that this is an institution not merely of no religion, but against all religion. Occasion was taken at the last meeting of the visitors to bring forward an idea that might silence this calumny, which weighed on the minds of some honest friends to the institution. In our annual report to the legislature, after stating the constitutional reasons against a public establishment of any religious instruction, we suggest the expediency of encouraging the different religious sects to establish each for itself a professorship of their own tenets, on the confines of the university, so near as that their students may attend the lectures there, and have the free use of our library and every other accommodation we can give them; preserving, however, their independence of us and of each other. This fills the chasm objected to ours, as the defect in an institution professing to give instruction in all useful sciences. * * * By bringing the sects together and mixing them with the mass of other students we shall soften their asperities, liberalize and neutralize their prejudices, and make the general religion a religion of peace, reason, and morality.

My interest in the coordination of religious culture and secular education at State universities was enlisted by Dr. Samuel Spahr Laws. His view of the coordination of church and state at the most strategic point, the State university, is embodied in the following letter concerning the establishment of Bible chairs at the seats of State universities, written from Columbia, S. C., January 1, 1894:

Rev. CHARLES A. YOUNG, *Ann Arbor, Mich.*

MY DEAR FRIEND AND STUDENT OF FORMER DAYS: It was a great pleasure to me to receive your letter from your present field of labor. The plan of organization and operation which you outline is, in my judgment, perfectly feasible. Those educational institutions which are not under denominational supervision are unprovided permanently with any assured and adequate care of their religious interests. This remark is particularly applicable to our State universities. At the University of Virginia it was the idea of its founder, Thomas Jefferson, that theological schools might be put on independent foundations, in close proximity to it, so as to avail themselves of its advantages, and reciprocate by extending over it their religious influences. In a letter written by Mr. Jefferson from Monticello, in September, 1813, he uses the following language, to wit: "Of all the systems of morality, ancient or modern, which have come under my observation, none appears to me so pure as that of Jesus. * * * The problem confronts us, How can Christian influences be best mingled with educational influences in those institutions not directly under religious care?" In our country, wisely, church and state are separated, and State education is, as in no other country of the world, secularized. In Germany for centuries the theological faculty has stood first of the four fundamental faculties of the university. Such a combination with us is impracticable. The influence of religion in our State universities must consequently be indirect. You are pleased to ask me about my own attitude on this matter during my long service as chancellor of the University of the State of Missouri, of which you gained some knowledge while a student there. * * * As an established means of organizing Christian influences in permanent association with the university, I held for a number of years a magnificent lot of 10 acres right alongside of the university, with the view of its allotment to the Christian denominations of the State for their individual Christian schools, or for one grand united Bible school, which should sponge out of the university all that was available for theological students. * * * I had then several hundred thousand dollars deemed available for founding this enterprise. However, "The best laid schemes o' mice and men gang aft aglee." Wishing you great strength in your work, I remain,

Your friend, S. S. LAWS.

It will be seen that the union Bible school which Dr. Laws hoped to establish would have been a great improvement over Mr. Jefferson's idea of the different religious sects establishing "each for itself a professorship for their own tenets." It remained for Christian women to realize what Mr. Jefferson and Dr. Laws hoped but failed to accomplish.

Digitized by Google

In 1886 Mrs. Sarah Hawley Scott, of Detroit, died, leaving over $12,000 to missionary societies. This amount was intrusted to the Christian Woman's Board of Missions, of which Mrs. Maria Jameson was then president. With the proceeds of the Scott bequest a handsome chapel was built and the Church of Christ organized at Ann Arbor, Mich., in 1891. The church which the Christian Woman's Board of Missions established was an essential prerequisite for the establishment of the English Bible chairs. But while preaching religious truth on Lord's days is efficient, it is not sufficient for university students. The student habit of mind makes "Jesus as a teacher" more influential than "Christus orator." The preaching function is important, but the teaching function, even in matters of religion, is still more important. University students are surfeited with science, even to the neglect of history and literature, language and the fine arts. The Bible—its ethics and its literature, its truth and its life—should be taught in order to restore the symmetry of a true development, physical, intellectual, and spiritual. In 1893, under the leadership of Mrs. O. A. Burgess, the Christian Woman's Board of Missions established the first English Bible chair at the seat of the University of Michigan. Its purpose is to teach the Bible—not theology, not denominational tenets, but the Bible—from the standpoint of history and literature, to all students, Christian and non-Christian, male and female. Literature is the interpretation of life. Biblical literature is the best interpretation of the higher life. The necessities of positive spiritual ideas in State universities, where science, with its secular tendencies, is so largely emphasized, has been well expressed by Dr. Harris:

> Nature presupposes a God of grace and good will toward His creatures. * * * But the mind, disciplined solely in observing independence and external relations, becomes of the opinion that it is not necessary to assume self-activity to explain anything in nature. * * * Natural science, with its predominant use of the categories of quality and quantity, fails in the department of organic nature to comprehend the plant and the animal, and it fails still more signally to recognize the spiritual in man. * * * Now, the corrective for such studies as lay too much stress on external observation is found ready at hand in the studies of human nature, language, history, and literature. Religious literature, of course, touches the problem directly and offers to the individual in the form of authority the spiritual theory of the universe. (The Study of Natural Science—Its Uses and Dangers. W. T. Harris, LL. D.)

Man is material, mental, and moral. As a university student he needs athletics or manual training for his physical development; he needs to study science and art, language and literature, for his mental expansion, but above all and conserving all he needs to study the Bible as the Book of Life, its history and its literature, for his religious culture.

HISTORY OF THE ANN ARBOR BIBLE CHAIRS.

The idea of endowing an English Bible chair at the seat of the University of Michigan was first advocated by the writer in 1891, while pastor of the Church of Christ in Ann Arbor. Harris Hall, McMillan Hall, and Newberry Hall were equipped with libraries and other facilities for Christian students of the various denominations, but no systematic Bible teaching was offered. At the National Convention of the Christian Woman's Board of Missions held in Nashville, Tenn., in 1892, the president, Mrs. O. A. Burgess, recommended the establishment of an English Bible chair at Ann Arbor, Mich. After due deliberation the convention unanimously recommended "the endowment of one or more Bible chairs" at Ann Arbor, and a committee was appointed to present plans for the work at the next national convention. This was held in Chicago in 1893, when the following report was made by the Bible chair committee:

> Inasmuch as the great need of the world is a knowledge of Christ and the simple gospel He taught, and as a higher education and a broader culture are demanded by the people, which demand can only be met by an increase in the force of edu-

Digitized by Google

cated workers; and inasmuch as God has opened the way for the Christian Woman's Board of Missions to further this end through its mission:

Resolved, That we heartily indorse the steps that have been taken toward the permanent establishment of a chair of the English Bible at Ann Arbor, and would recommend—

1. H. L. Willett, who comes to the position bearing the honors of Bethany and Yale and Chicago universities, as one eminently fitted for the professorship of that chair.

2. We would recommend Clinton Lockhart, whose credentials for fitness are unquestioned, as a suitable assistant to the work.

3. We recommend, inasmuch as the needs of the present year are in a large measure provided for, that the executive committee be directed to take such steps as may be required for the further progress of the Bible chairs.

Respectfully submitted.

Mrs. PERSIS L. CHRISTIAN.
Mrs. M. F. MILES.
LURA V. THOMPSON.
Mrs. V. A. POLLARD.

The recommendations of this committee were adopted, and the executive committee of the Christian Woman's Board of Missions was authorized to begin the work at once.

The purpose of the Ann Arbor Bible chairs is as follows:

1. To provide biblical instruction for the students of the university and other persons who may desire to study the Bible.

2. So to present the claims of the Christian ministry as to win to it well-educated young men who are endowed by nature and qualified by character for such work.

3. In connection with advantages already offered by one of America's greatest universities, to provide a high-grade missionary training school where young men and young women can prepare themselves for the foreign field. Those desiring to become medical missionaries will find superior advantages in the medical schools of the university, and may at the same time receive training under the Bible chairs in the study of the Bible and in missionary history and methods.

4. To provide training in Bible study and methods of work for young preachers and others who are to engage in Sunday school, Endeavor, and other church work. It is thought that Sunday school teachers and leaders in Endeavor work may be glad to avail themselves of this instruction, and perhaps at the same time attend some of the lectures in the university.

The methods of the Ann Arbor Bible chairs are as follows:

1. Regular courses of Bible study for university students are offered by the instructors each year. They aim to make their instruction as scholarly and as inviting as any that is offered in the university, and especially to appeal to the spiritual nature of the students. They are in deep sympathy both with the Bible and with the students. It is their chief purpose to teach the Bible.

2. One or more Bible institutes, lasting from three to five days, are conducted at Ann Arbor under the auspices of the Bible chairs each year. The instructors in these institutes are the best biblical scholars that can be secured, regardless of denominational affiliations. These institutes are well attended and are much appreciated by students and by citizens of Ann Arbor.

3. Lecture courses on Christian sociology, Christian missions, and other problems involved in the application of Bible truth to individual and social life are provided each year.

4. It is the aim of the instructors to put the students into sympathetic touch with the best biblical literature.

The actual work of the Bible chairs began October 1, 1893. The courses offered for the year 1893-94 were as follows: History of Israel, Prophecy, Psalms, The Life of Christ, Paul and His Epistles, Methods of Christian Work, Religious Movements in America, and New Testament Greek. The largest classes were those in the Life of Christ and in the Life and Epistles of Paul. The number of registrations during the first year was 59. The number of courses elected was 80. Special lecture courses were given by A. McLean, general secretary of the Foreign

Digitized by Google

Christian Missionary Society, on "Missions and missionaries," and by Prof. George D. Herron on "Applied Christianity." Hundreds of students and citizens of Ann Arbor attended these lectures. The lectures have since been published in book form. The price fixed by the instructors for each course of study was $1 per term. Owing to an arrangement with the Student's Christian Association, whereby the use of Newberry Hall was secured for the classes, the members of that association were admitted at one-half price.

The success of the Bible chairs for the first year surpassed the expectations of the most sanguine friends of the work. The question whether university students would avail themselves of biblical instruction if it should be offered them was definitely settled by the fact that a large number of them had elected the Bible chair courses and faithfully pursued them. The instruction offered was placed on a thoroughly scientific and practical basis. The Bible chair experiment received strong commendations in the press, both local and general, and especially in the religious papers. Prominent educators all over the country took an interest in the experiment. Dr. Richard T. Ely, of the University of Wisconsin, thinks the success of the principle involved will form an epoch in the history of education.

The following letters written at the close of the first year's work indicate the impression which it made upon the leaders of thought and religious life in Ann Arbor:

ANN ARBOR, MICH., *June 8, 1894.*

To the Christian Woman's Board of Missions:

You might like to learn our impression of the work undertaken here by Mr. Willett and Mr. Lockhart. It gives us pleasure to say that their classes have been larger than they expected and that we feel under obligations to them for the help they have rendered in the religious work among our students. The friends who have contributed to the support of the new enterprise have every reason, I think, to be more than satisfied.

Yours, truly,

JAMES B. ANGELL,
President University of Michigan.

Mrs. O. A. BURGESS,
President of the Christian Woman's Board of Missions:

We, the undersigned, pastors of Ann Arbor, Mich., wish to express our sympathy with and approval of the great and commendable work which the Christian Woman's Board of Missions have done and are doing in our city, the seat of the University of Michigan. The Church of Christ has, from its beginning, been unequivocal in its loyalty to our divine Lord and Saviour, as the Son of God, and the work of the Bible chairs has been, and we trust shall continue to be, a tower of strength for evangelical Christianity among the students of the university. We rejoice in the success which has thus far attended your efforts to have the Bible taught systematically as the Word of God to our students, and hope the Bible chairs may be firmly established and well endowed.

Respectfully submitted.

C. M. COBERN,
Pastor Methodist Episcopal Church.
J. M. GELSTON,
Pastor Presbyterian Church.
J. W. BRADSHAW,
Pastor Congregational Church.

Prof. G. P. Coler was called to take charge of the Bible chair work in February, 1895. Fifty-two students took regular work the second year. The following courses were given: The Life of Christ, the Life and Epistles of Paul, Prophecy, History of Missions, a Normal Course for Sunday School Teachers, and the Philosophy of Religion.

The third year of the Bible chairs began the first week of October, 1895, with a Bible institute, which was conducted by Ernest D. Burton, professor of New Testament Exegesis in the University of Chicago, and by Dean H. L. Willett, of the

Digitized by Google

Disciple Divinity House, Chicago. There were ten sessions of this institute and these sessions were well patronized. The institute served a good purpose in many ways, one of which was the prominence into which the Bible chair work was brought before the students and citizens of Ann Arbor. At the close of this institute Bible chair classes were organized and taught by Rev. C. A. Young and G. P. Coler. Mr. Young withdrew from the work as instructor in February, 1896, and Professor Coler was assisted by Mrs. W. C. Hull, who taught a class in Old Testament history. During the year courses were given in the following subjects: The Life of Christ, the Gospel of John, the Life and Epistles of Paul, the Epistles to the Hebrews, Old Testament History, Christian Ethics, the Gospel of Matthew, the Epistle to the Romans, the Great Religions of the World.

Ninety-five different students enrolled in these classes, 59 young men and 36 young ladies. Many others applied for courses, but hours could not be suitably arranged.

The fourth year of the Bible chairs opened the first week of October, 1896, with an interesting Bible institute, conducted by Dr. H. L. Willett. Seventy-five students are already (November 17, 1896) enrolled in the Bible chair classes, and it is probable that still others will enroll before the close of the semester in February. It is expected that a much larger enrollment will be secured for the second semester of this year.

SIMILAR WORK AT OTHER STATE UNIVERSITIES.

This wise policy has been signally pursued in occupying State university centers. Not only at Ann Arbor, Mich., where nearly 3,000 students are annually gathered, is the Christian Woman's Board of Missions bringing the English Bible chair to the attention of a great university community, but also at Charlottesville, the seat of the University of Virginia, and Athens, the seat of the University of Georgia.

It is worthy of note that the influence of the wise policy of the Christian Woman's Board of Missions in having the Bible taught at State university centers has been even more far-reaching than was anticipated when the work at Ann Arbor began in 1893. This is plainly manifest in the fact that the Disciples of Christ in several States have not only adopted the plan of teaching the English Bible from the standpoint of history and literature to *all students, irrespective of their future life work*, but in three States at least have advanced beyond the popular feature of the Bible chair work emphasized by the Christian Woman's Board of Missions to the more distinctly *educational* feature of giving special training to ministerial students. With this in view the Berkeley Bible chair, located at the seat of the University of California, has been superseded by the Berkeley Bible Seminary, with two competent instructors. H. D. McAneny, financial secretary of the Berkeley Bible Seminary, deserves great credit for the excellent work he has done. The year ending July 30, 1896, this faithful, energetic secretary reported over $80,000 pledged by the churches of California to the Berkeley Bible Seminary fund. Since then I have been informed that Hesperian College has transferred its endowment, over and above its indebtedness, to the seminary fund.

At Columbia, Mo., under the leadership of J. H. Garrison, editor of the Christian Evangelist, assisted by T. P. Haley, W. T. Moore, D. O. Smart, and others, steps are being taken toward the establishment of a Bible college contiguous to the University of Missouri. So far the teaching of Dr. Moore has been a popular work among a large number of students rather than special training to a limited number of ministerial students, but as soon as sufficient endowment can be raised to support two or more regular instructors more technical work will be done without neglecting the broader popular features of the work. Prof. E. C. Sanderson is doing excellent work in pushing the establishment of the divinity school at Eugene, the seat of the University of Oregon. Perhaps the most significant enterprise

Digitized by Google

related to the Bible-chair movement is the establishment of the divinity house in connection with the divinity school of the University of Chicago. The work of the divinity house, under the direction of Herbert L. Willett, Ph. D., and Edward S. Ames, Ph. D., is quite distinct from the Bible-chair work and should not be classed with it, since it is of a technical theological character and not popular Bible study. It is related to the Bible-chair enterprise, since it is in alliance with a university, but it differs from it in being graduate in character and in being connected with a university which is not a State institution. The establishment of one or more Bible chairs at the seat of a State university was first proposed by Mrs. O. A. Burgess for national consideration in 1892. The actual work of teaching the English Bible, from the standpoint of history and literature, to students in general began at Ann Arbor in 1893. The Bible-chair movement is only three years old—still in its infancy—yet systematic biblical instruction will be offered the students at six of our State universities this coming year by the disciples of Christ. Under the auspices of the English Bible chair of the Christian Woman's Board of Missions, Prof. G. P. Coler and others will give systematic instruction in the Bible and the history of missions, at Ann Arbor; Dr. Herbert L. Willett, during his leave of absence from work in Chicago, will be employed in systematic Bible teaching at the University of Virginia; C. A. Young will do similar work at the University of Georgia; Dr. W. T. Moore gives all of his time to Bible teaching at the University of Missouri; Prof. S. M. Jefferson and Prof. A. M. Elston at the University of California, and Prof. E. C. Sanderson at the University of Oregon. When the report of the committee recommending the establishment of the first English Bible chair was read at Nashville, J. H. Garrison said: "The inauguration of this movement will make this night historic." No one who understands it questions the wisdom and practicability of the Bible-chair movement. The only question before us is, Shall we adequately support it? Each Bible chair ought to have an endowment of at least $50,000. The following communication expresses the judgment of a number of State university presidents and may fitly close this report:

UNIVERSITY OF GEORGIA,
Chancellor's Office, Athens, Ga., May 8, 1896.

Rev. Mr. C. A. YOUNG.

REVEREND AND DEAR BROTHER: The Manual of Bible Chairs at the University of Michigan has given me both pleasure and instruction. You may rest assured that such work at this university would receive a warm welcome and hearty support from all good men, especially from the faculty and trustees.

The general idea embodied in the Manual has been for years in the minds of some of us. In our opinion it solves one of the greatest problems of the higher education in the United States, viz, How can the religious element be fostered in our State universities? To this you reply: This great work can be best done by the churches of Christ placing Bible chairs in close contact with their young men while enjoying the benefits of the State university. The enterprise must be wholly ecclesiastical, and the control must be in the denomination, not in the university.

The benefits of your plan seem to be equally great to all parties concerned:

(1) It fully recognized the American doctrine of the complete separation of church and state. Each of these great societies is left uncontrolled and unhindered to pursue its own legitimate ends in its own constitutional way. Yet incidentally they benefit each other very much, as two independent political sovereignties would do which permit their people to exchange commodities on favorable terms.

(2) It secures to members of such churches, with the least possible expenditure, all the benefits of the State's costly endowments for literary and scientific education. They reap a return from the taxes paid by them, and at the same time enjoy all that can be done to retain their sons while they are minors in the faith of their parents. And the church, as it seems to me, ought to accomplish better results than she can do in any other way. She is helping to keep a great institution from the possibility of being given over to secularism. And yet she is acting strictly within her divine commission, which reads: "Go ye, therefore, and make disciples

Digitized by Google

of all nations, * * * teaching them to observe all things whatsoever I have commanded you." That is to say, she escapes from the entanglements of geology, biology, and metaphysics, which, however valuable they may be for mental training, are certainly not among the "things" which Christ commanded. And if, like Paul, the church can truly say, "This one thing I do," like him, she should be able to do it well.

(3) The State and her university will share fully in the blessing of this arrangement, for all men know that the morality of the gospel is the best and cheapest safeguard to order. All see that Christianity creates a better citizenship—manlier men, more womanly women. The withdrawal from the State university of so many of the more pious young men is a public calamity, for in the university they are "the salt of the earth" and the "light of the world."

Nor would the Bible chairs interfere in the least with the work done by the Young Men's Christian Association, the influence of which is chiefly to stimulate devotional feelings and promote Christian work for others. The Bible chairs would supply a steadier light to the conscience, and would forearm the reason against doubt and disbelief.

I conclude, dear brother, as I begun, by assuring you of a warm welcome and a wide field in the University of Georgia, should your friends enable you to plant Bible chairs close beside us.

Yours, faithfully,

WM. E. BOGGS,
Chancellor of the University of Georgia.

The establishment of English Bible chairs at the seats of State universities, so as to coordinate secular and religious instruction, I consider eminently practicable. It provides symmetrical education on the most economical basis possible. It disarms prejudice against our State universities from those who fear the tendencies of secular education. As has been well said, "It is the principle of business in Christianity which recognizes the importance of occupying great educational centers for the purpose of radiating the light of religious truth."

As the above matter goes to press a letter is received from Rev. Charles A. Young respecting the promotion of Bible study among the students of the University of Virginia. The following extract from the letter and the circular appended show the work in detail:

I have been conducting Bible study from the standpoint of history and literature among the students of the University of Virginia upon the same plan I introduced at Ann Arbor, Mich., Athens, Ga., and elsewhere. * * *

Over a score of the best and brightest young men who are students of the University of Virginia gave me two hours per week in class room and three hours per week studying special duties I assigned them in biblical history and literature, making five full hours per week given to the systematic study of the Bible.

YOUNG MEN'S CHRISTIAN ASSOCIATION, UNIVERSITY OF VIRGINIA.

BIBLICAL INSTRUCTION.

The purpose.—It is the object of these lectures to afford opportunities for the study of the Bible from the standpoint of history and literature to members of the university and other persons who may desire to pursue such courses of investigation. The Bible is obtaining increasing recognition as a collection of literature, possessing a distinct educational as well as ethical and religious value. It is recognized as the most profoundly influential book in existence. Its study may, therefore, well find a place in the educational discipline of every member of the community.

Courses of study.—The themes presented will include four courses of study, as follows: The Life and Letters of Paul, ten lectures; The Minor Prophets, ten lectures; The Life and Writings of John, five lectures; Book Studies, etc. (popular course), five lectures.

These lectures will be delivered in the university chapel on Tuesday, Wednesday, Thursday, and Friday evening of each week during five weeks, from January 18 to February 18, 1898, and at such other places and hours as shall be arranged by

Digitized by Google

the general secretary of the Young Men's Christian Association with those who may pursue any of the above courses.

Admission to courses.—Those who are desirous of taking any or all of these courses will register with Mr. Charles Hancock, to whom the fees may be paid upon registration as follows:

One course of five lectures	$1.00
Two courses of five lectures, or one double course of ten lectures	1.50
Admission to all courses	3.00

The fees to members of the Young Men's Christian Association and to ministers will be one-half the above.

Arrangements for nonresidents.—Persons residing in other places may avail themselves of this opportunity for Bible study by residence in Charlottesville during the period of the courses. Ministers can return to their churches over Sunday if they find it desirable. The necessary expenses of residence in Charlottesville will not exceed $5 per week.

Consultation.—Those desiring to make inquiries or engage accommodations may address W. I. McNair, general secretary of the University of Virginia, Young Men's Christian Association.

Those who desire to inquire further regarding these courses may consult Mr. Hancock or the general secretary at the office of the Young Men's Christian Association.

CHAPTER XXXIII.

METHODS OF INSTRUCTION IN AGRICULTURE.

INCLUDING LEAFLETS ILLUSTRATING THE EDUCATIONAL WORK DONE AT THE CORNELL AGRICULTURAL EXPERIMENT STATION AND AT PURDUE UNIVERSITY.

THE SCHOOL GARDENS AT THE BUSCOMBE BRITISH SCHOOL.

[From volume 2 of Special Reports on Education by the British Educational Department.]

Starting a school garden.—There are two ways of setting boys to work at gardening. They may either cultivate a plat in common or each boy may be provided with a plat of his own. The latter plan is the better, because it offers superior educational advantages. If, for example, a boy is one of a group cultivating a garden, he can not know for certain what is the effect of his share of the work. It is only when a boy is sole master of a plat of his own that he can be sure what the results of his efforts really are—whether meritorious or defective.

The objects of school gardening.—A school garden must not be treated as though it were an allotment. The difference is important, because, if it is ignored, the school garden may prove a pecuniary success, but an educational failure. The owner of an allotment naturally seeks to make the greatest commercial profit out of his parcel of land. In the school garden, on the other hand, the boys have partly to receive instruction in the rudiments of the gardener's craft according to the best methods and partly to find illustrations for their lessons in natural science and to make practical application of them. In an allotment the owner often finds it to pay better to grow one or two kinds of crops, either for the sake of the demand for them in his market or because the soil is best suited for them. The schoolboy should learn how to raise a variety of crops, and will benefit educationally as much by failure as by success. Indeed, when the conditions of soil and climate are so favorable that, be the gardening good or bad, the crop is always forthcoming, though the undertaking may prove a greater commercial success, yet as an educational exercise it will have less value than where nature is unkindly and hard to subdue.

Again, the object of a school garden is certainly not to put boys as apprentices to gardening. Some boys, no doubt, who learn gardening will become gardeners in a professional way, but it would be wholly out of place in school unless it served a general purpose as well as having a technical aim.

School gardens are a part of general as well as technical education. A very slight acquaintance with modern text-books and their readers, whether dealing of the farm or of the garden or of the home, is sufficient to show that while many of the plain facts of modern science are assumed by the writers to be matters of general knowledge, most of the readers continue to regard such facts as outside their province and belonging to the peculiar domain of men of science. Now, some knowledge of the nature of a few of the chief gases and other chemical elements is really indispensable for the farmer, the gardener, and the housewife, and it may be acquired in more ways than one. While a girl may study it in connection with

Digitized by Google

cooking and cleaning, a boy may have it brought home to him in connection with a garden plat. The kind of experiments which may be made and studied with advantage in connection with school gardens are described in Laurie's Food of Plants and in an extremely practical and suggestive paper by the professor of botany in the Durham College of Science, Mr. M. C. Potter. Mr. J. H. Crawford published in Natural Science (July, 1892) a plan for making an agricultural museum, which offers valuable suggestions for associating practical garden work with the study of elementary science in the class room.

The result of this combined indoor and outdoor instruction will be to spread a much-needed type of general as well as technical knowledge. The rising generation will learn what is the true nature of an experiment, what are the methods of modern science, in what way observations are made and inferences are drawn from them, what are the sources of error, and how it comes about that a merely practical man may as easily underrate as overrate the researches of the laboratory.

The division of the ground, and therefore, first the size, shape, and arrangement of the individual plats.—Each boy, then, should have a plat to himself. In the Buscombe School Gardens there are plats for 12 boys. The plats must not be too large, because the boys can not work more than two afternoons a week. The shape, again, is important, because it is desirable that the boys should be able to perform much of their gardening while standing on the paths between the plats instead of having to step on the border for every operation. The plats, therefore, measure 30 feet in length and are only 10 feet in width. The four corners of each plat are carefully marked by squared and substantial pegs firmly driven into the ground. Each plat is numbered and the numbers are written clearly and boldly on the face of the pegs. The longer axis of each plat extends along a line from east to west, which facilitates the cropping. The vegetables are planted in rows across the plats from north to south, because this plan gives them the best chance of thriving. Each particular kind of vegetable is planted on the same line right across all the plats (see plan), so that although in the separate plats the rows are short, being only 10 feet long, yet, when the whole set of plats is looked at in one view, the vegetables are seen to be planted in long rows extending right across the gardens in regular lines, from the north boundary to the south. The success of each boy is thus easily comparable with that of the others.

Cropping of a plat.—Let us now see how a plat is cropped: Broad beans, hollow crown parsnips, white Spanish onions, Bedfordshire champion onions, radishes, lettuce (cos and cabbage), potatoes (three rows—early, medium, and late), Brussels sprouts, cauliflower, James's intermediate carrot, shorthorn carrot, pineapple beet, Wheeler cabbage, drumhead savoy, Veitch's autumn giant cauliflower, scarlet runners. The scarlet runners were planted on the side next the road, and served as a screen against the depredations of roughs and idlers, who, in the absence of the boys, would occasionally steal their best vegetables.

(2) *Other plats for working in common.*—Besides the ground which was taken up by the 12 plats and the paths between them, the inclosure contained space for two other purposes.

(*a*) Along the south side there is a border about 100 feet in length and 10 in width for growing certain vegetables which will not lend themselves readily to separate treatment in the 12 plats, such as asparagus, marrow [gourds], and sea-kale. Here too are planted several pot herbs, such as thyme, sage, marjoram, etc., and also seedlings to be pricked out later in the other plats, such as lettuce, celery, leeks, sprouts, and cabbage.

(*b*) At the east end of the ground there is space for 4 plats of the same size as the 12 others—namely, 30 by 10 feet—in which certain fruit trees were planted, including standard apples, pears, and plums, and also such brush fruit as currants, gooseberries, and raspberries. Room is also found for some tomatoes, a strawberry bed, and a few herbaceous flowers, by way of ornament, and some roses.

Digitized by Google

In the northeast corner a small frame 6 by 4 feet was placed for the purpose of growing seedlings, which might thus be preserved through the winter for early spring planting. In these plats the boys learned how to bud roses, to train fruit trees, and to make grafts in different ways.

Care of tools.—The ground was inclosed by a barbed-wire fence, which was stretched upon strong posts. Inside of this fence was planted a privet hedge, in which were set at intervals a few trees, such as poplars, maple, birch, and ash. At the gate of the inclosure a wooden hut was built for the accommodation of the tools and seeds. It was made of tarred boards, with a corrugated iron roof, 9 feet square, 9 feet high at the back and 6 feet in front. The floor is of brick, and shelves are provided. Each plat has a set of tools assigned to it, and each tool is numbered to correspond with the plat to which it belongs. Each set of tools hangs from a peg, which is numbered to correspond with the plat to which it belongs. The boys are taught to keep their tools scrupulously clean by aid of linseed oil and paraffin, and to put them away in an orderly manner after using them. The plat tools are adapted in size to the use of the boys, one 4-inch Dutch hoe; one 4-inch draw hoe; one 4-prong [spading?] fork; one spade (7 by 11 inches), and one 10-toothed rake. Besides these are other tools for common use, to wit: 1 besom, 1 mallet, 2 wheelbarrows, 1 water can, 2 boat baskets, 4 lines 60 feet in length. The plans show the details of the arrangements, which have been described.

The effect of good and bad gardening contrasted.—The soil was originally of the worst possible description, consisting of almost pure gravel. The boys had obviously to overcome natural difficulties. Cultivation was commenced by trenching to a depth of 2 feet, which involves digging out three spits (to the depth of three spades about). Stable manure was applied somewhat liberally at the bottom of the trench. The summer of 1896 was very dry, but owing to this "bastard" trenching, although there was no artificial watering, the fine growth of the crops in these plats, as compared with the scanty growth in neighboring gardens, where there was far less labor expended, proved the truth of the old saying, justissima tellus, for "the honest earth well repaid all the toil." The produce of the gardens received certificates of merit at more than one horticultural show. The contrast between the results of good and bad gardening forms a most telling object lesson, and the difference in the crops according as the boys are more or less skillful, or as they are careful or careless, is well demonstrated by the arrangement of the rows of vegetables which cross the plats in a straight line. In the report of the Woburn fruit farm for 1897 a method is described of making approximate measurements of the comparative loss of growth which is due to neglect and bad method. The instructor of the Buscombe School Gardens, himself a nurseryman, is attempting to teach the boys to practice the method of measurement there described.

The young gardeners' diary and account book.—The boys are taught to make rough notes on the ground, recording the operations of each day, the dates of planting seeds, and the names of the sorts selected. Hints are added to this instruction as to the distance between the rows of plants, and also between plants in the row, and a record is made of the kind of manure which is used and other matters. A daily record of the weather is kept and the amount of rainfall observed and noted. The notes are afterwards worked up in a systematic form, and serve as a gardener's diary of great value for future use should the boys in later life do some gardening of their own. A few extracts from one of the diaries are given:

March 15.—Sowing onion seed. White Spanish and Bedfordshire versus champion. One row of each, 1 foot apart; made drill about 3 inches deep. After sowing the seed, raked the soil over them and patted it down with the spade.

March 22.—Trenching and manuring. The brood beans and pease are showing above ground.

March 16, 23, and 29.—Trenching, manuring, and weeding.

April 2.—Finished trenching in all the plats to-day. Edging and weeding paths.

Digitized by Google

May 14.—Sowed one row of cabbage lettuce in the experimental plat. Dressed the cabbage plants with four different kinds of artificial manure, namely: Two rows with nitrate of soda, two rows of nitrate silicate, two rows with native guano, one row with ichthemic guano.

Each boy sold the produce of his own plat, and the money so earned was brought to the instructor, who received it and entered the amount in an account book, reserving a separate page for each plat. Each boy also kept an account book of his own, so that he might feel sure that he received his proper share. The money is divided, and one-half is devoted to the purchase of seeds for the next season, while the other half is given to the boys in proportion to their earnings. In this way some boys earned as much as 8 shillings in the year, while the average was about 6 shillings.

In conclusion, says Mr. Rooper, I may add that a year's garden work had a strikingly beneficial effect upon the growth and physical development of the boys who had thus done their part to carry out the somewhat neglected instruction to man to go forth "and till the ground whence he was taken."

LEAFLET.[1]

ON NATURE STUDY.

ESPECIALLY ADAPTED TO THE USE OF CHILDREN IN SCHOOLS IN RURAL DISTRICTS.

[Prepared by the faculty of Purdue University.]

AN EXPERIMENTAL FARM FOR YOUNG PEOPLE.

[By Prof. W. C. LATTA.]

In Leaflet No. 9 Professor Coulter told you about a *school garden*. If you have acted on the suggestions of that leaflet, you are beginning to realize how attractive, interesting, and instructive such a garden may become. More than this, you have learned how easily and cheaply you can beautify the school yard with flowers and vines.

---

[1] ADDITIONAL NOTES TO TEACHERS CONCERNING THE USE OF THE NATURE-STUDY LEAFLETS.

It is important to observe that very much of the nature study by the children must be done out of doors and in the spring and summer, but many of the schools will not be in session at that time of the year.

Such of the leaflets therefore as especially relate to spring and summer work on the part of the children should be translated into oral lessons and given by the teachers of such schools during the winter term. It is quite apparent the leaflets can often be used in this way with but few slight changes in phraseology. Thus instead of taking the children on an excursion in May to observe spring birds, the teachers can rephrase the leaflet on that subject and use it as a basis for a conversation with the children, instructing them how to become good observers as they go about and requesting them to report the results of their observations at the beginning of the next term. These oral lessons should bring out as much as possible the previous information of the children.

Some of the leaflets, however, which seem especially to relate to objects which can be observed only in the spring, may serve as models upon which the teacher can construct exercises adapted to use in the fall by substituting subjects of study which can be readily found in the later months of the year.

To emphasize what has already been said in the letter of transmittal it may be repeated that the chief purpose of these leaflets is to suggest *methods* to the teachers rather than to give them information, and that the most successful results will be obtained when teachers are able to supplement these lessons by those of their own construction.

JAMES H. SMART.

PRESIDENT'S ROOM, PURDUE UNIVERSITY,
Lafayette, Ind., March 4, 1899

Digitized by Google

In this leaflet I wish to show you how to have a miniature *school farm*, which may be made quite as interesting and instructive as the school garden.

But I fancy I hear you say, "Where can we find room for such a farm? We can't take it out of our playground. It is too small now." You are quite right. Don't take any part of your school yard, but persuade the school authorities to provide a small enclosure—at least one rod by four in size—just outside the school yard. Doubtless some kind-hearted farmer who has not forgotten that he was once a boy will let you have the ground, and then I am sure you can get the school board to put a strong, close fence around it.

In this small enclosure the older boys can prepare the ground, plant the seeds, and cultivate the crops "by hand." About the only tools you would need for this purpose would be the spade, the hoe, and the rake.

In such a piece of ground you could conduct a great many simple experiments with the farm crops. You could watch the process of germination, growth, fertilization, and development of grain, and you could also note when, where, and how insects and fungous diseases attack the several crops. By conducting these experiments you would learn many interesting facts that would prove very helpful on the farm.

It is not expected that you would be able to grow as good crops as the farmer can under more favorable conditions. You must remember that the *chief* object of the school farm is to *get knowledge*, which will, later in life, help you to become more successful farmers.

Do you know how valuable knowledge gained by careful observation and experiment really is? Just this kind of knowledge is considered so valuable that our Government expends annually nearly a million of dollars to maintain agricultural experiment stations in the several States and Territories and in the District of Columbia.

This vast amount is expended in conducting and in publishing the results of experiments that will help the farmers to avoid mistakes and employ only the best methods. By using this experimental knowledge the farmers of the country will be enabled to save many times this sum.

A prominent farmer of northern Indiana estimates that the farmers in his county alone might have saved one and one-half millions of dollars in the last ten years by fully using the information afforded by the experiment station and the farmers' institutes.

Experiments have shown that the stinking smut of wheat can be effectually destroyed by simple treatment with hot water. If this remedy *alone* were faithfully used by all farmers whose wheat is affected it would save them millions of dollars.

The farmers of Indiana annually expend many thousands of dollars for new varieties of grain in the belief that the old varieties are "running out." Many carefully conducted experiments at Purdue University and elsewhere have clearly shown that these varieties do not *necessarily* run out, and that the old and tried sorts, if well cared for, will generally do as well as, or better than, the new kinds for which some farmers will pay three or four prices.

The value of the experiments which you can conduct on a school farm will depend on what you undertake and how you do the work. If you begin at the wrong time, do the work in a careless manner, or if you fail to finish what has been well begun, your observations and experiments may have very little value; but if you will carry out even the simplest kind of an experiment from beginning to end in a careful manner, you will surely gain some useful knowledge. More than this, you will acquire the habit of systematically taking and recording observations which will prove invaluable to you all through life.

In order to help you, I will suggest (1) a few very simple experiments that you can try in the garden at home or in some corner where they would not be dis-

Digitized by Google

turbed, and (2) how to arrange and manage a school farm, in which you could join with your schoolmates in conducting a variety of experiments.

One of the very interesting things you might do in the garden at home is to collect and plant all the varieties of peas you can get. This might include the Canada field peas, the several kinds of garden peas, and the different varieties of sweet peas. Plant in drills, at least one foot apart, dropping the seeds two or three inches apart in the drill. Do all the planting in one day in the early spring, and cover about two inches deep. Note (1) when each kind "comes up;" (2) the difference between the first or seed leaves and those which follow; (3) how tall each kind grows; (4) when each kind blooms; (5) differences in the size, color, and fragrance of the flowers; (6) differences in the form and size of the seed pods and in the number of pods produced on a single plant of each kind; (7) when each kind matures. You will, of course, need supports for the taller varieties. When each variety comes into bloom it will be interesting to carefully dig up one plant of each kind and examine the roots for nodules (little rounded enlargements), which will vary in size from a pin head to a pea. The little colonies of microbes which live in these nodules have the singular power of capturing the free nitrogen of the air and of rendering it available for crops.

Most if not all of the leguminous plants (including peas, beans, clovers, etc.) have this peculiar power of "fixing" nitrogen through the agency of microscopic soil microbes, and this is one reason they are called soil-renewing crops.

This experiment would be nearly, if not quite, as interesting if made with varieties of beans or corn or potatoes.

If in addition to, or instead of, these experiments at home you desire to join with your schoolmates in making a *series* of experiments, the school farm will best serve your purpose. An enclosure 1 rod wide by 4 long is perhaps as large as you can well take care of "by hand." In such an enclosure you can lay out a series of 20 plats, each 1 yard square, for the small grains, and another series, each 6 feet by 7, for corn, potatoes, etc. The accompanying diagram, containing half the plats in each series, shows how the plants may be arranged, and indicates also the number of hills or drills to each plant.

LIST OF EXPERIMENTS.—SERIES I.

No. 1. Wheat sown broadcast.
No. 2. Wheat sown in drills.
Nos. 3 and 4. Rye sown as Nos. 1 and 2.
Nos. 5 and 6. Oats sown as Nos. 1 and 2.
No. 7.[1] Two drills seed wheat covered ½ inch deep and two drills seed wheat covered 1 inch deep.
No. 8. Two drills seed wheat covered 2 inches deep and two drills seed wheat covered 3 inches deep.
Nos. 9 and 10. Seed oats sown as Nos. 7 and 8.
No. 11. Two drills small shrunken seed wheat and two drills large plump seed wheat.
No. 12. One drill seed wheat sown September 1 to 15, and one drill, each, seed wheat sown 2, 4, and 6 weeks later.
No. 13. Two drills seed wheat, 12 grains to each drill, and two drills seed wheat, 24 grains to each drill.
No. 14. Two drills seed wheat, 36 grains to each drill, and two drills seed wheat, 48 grains to each drill.
No. 15. One drill seed oats sown March 1 to 15, and one drill, each, seed oats sown 2, 4, and 6 weeks later.
No. 16. Two drills seed oats, 12 grains to each drill, and two drills seed oats, 24 grains to each drill.
No. 17. Two drills seed oats, 36 grains to each drill, and two drills seed oats, 48 grains to each drill.
No. 18. One drill, each, of red clover, crimson clover, alsike clover, and alfalfa, sown about April 1.
No. 19. One drill red clover, sown February 15 to 25, and one drill, each, red clover sown 2, 4, and 6 weeks later.
No. 20. Four drills crimson clover sown as No. 19.

SERIES II.

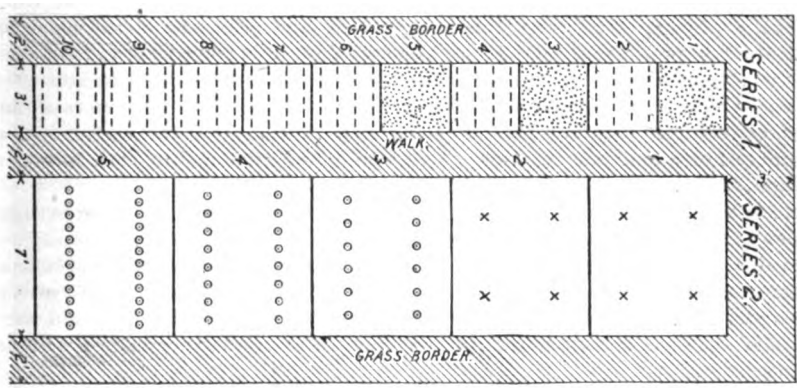
No. 1. Corn in hills, 3 grains to each hill.
No. 2. Corn in hills, 4 grains to each hill.
No. 3. Corn in drills, 6 grains in each drill.
No. 4. Corn in drills, 8 grains in each drill.
No. 5. Corn in drills, 12 grains in each drill.
No. 6. Corn in drills, planted April 20 to 30.
No. 7. Corn in drills, 2 weeks after No. 6.
No. 8. Corn in drills, 4 weeks after No. 6.
No. 9. Corn in drills, covered 2 inches deep.
No. 10. Corn in drills, covered 4 inches deep.

[1] Sow 20 grains to each drill of Nos. 7-12, inclusive, and to each drill of No. 15.

Digitized by Google

The following are some of the many other experiments you might undertake:

1. A test of varieties of corn, oats, and wheat.
2. Treatment of seed wheat, oats, and potatoes for fungous diseases.
3. Planting large and small cuttings of potatoes.
4. Planting potato cuttings, part with the "eye" *up* and part with the eye *down*.
5. Planting tip and butt kernels of corn.
6. Planting sound and defective seed corn.
7. A test of frequency and depth of cultivation of corn or potatoes.



INSTRUCTIONS.

1. Get advice from your elders as to best time and manner of doing the work.

2. As far as possible, avoid working the ground when wet. This is very important if the soil is heavy. In early and late planting you can not always avoid this.

3. Try to get the soil well pulverized before planting or sowing.

4. Each one of the older boys should have a memorandum book, in which he should draw a diagram of the plats, and number each one in both series.

5. Under the proper date and number note when and how each plat is prepared and planted.

6. Treat the several plats of a group just alike in all respects except the point under investigation. To illustrate: If you want to learn the effect of planting seeds deep and shallow, take care that the several plats in this group are prepared alike, planted the same day, with the same kind of seed, the same number of seeds, and cultivated at the same time and in the same manner.

7. Observe when the seeds in each plat "come up," the per cent of seeds that germinate, how the young plants look, etc., and make careful notes of these and other observations under the proper numbers and dates in your memorandum book. The chief purpose of this is to *acquire the habit* of making close observations and carefully recording the same. Your teacher will show you how to make the notes in your book.

8. From time to time during the season make careful observations, always comparing the several plats of the group with each other, and note in your book the points of interest.

9. Be on the lookout for the first appearance of rust on wheat, oats, rye, and corn. Examine both upper and under surfaces of leaves. Note to what extent each variety is affected by rust.

10. Note what per cent of smutted heads appear in wheat, oats, and rye. Be very careful to note the effect of treatment of seed on the amount of smut present.

11. Note when and where corn smut first makes its appearance, and whether any varieties show more smutted stalks than others. Note how many of the smutted stalks produce no ears. Extend your observations to the fields of corn

Digitized by Google

near by. By counting stalks in the field with and without smut, and noting the per cent of ears in each lot, you may learn how the proportion of grain is affected by smut.

12. If any plants become sickly or die before they mature, try to find the cause. It is quite likely to be the work of some injurious insect. If you do not look very carefully the little fellows may escape notice. Prove that boys have "sharp eyes" by finding and capturing the culprits.

13. It will be necessary to continue operations on your school farm during the summer vacation. Six or eight of you can do this by taking "turns" on successive weeks. Why not organize a school-farm club and elect one of the older boys director of experiments? If no one of the scholars feels competent to take charge of the experiments, invite some wide-awake, progressive young farmer of the neighborhood to act as director. Your teacher will cheerfully aid you to organize and conduct such a club. You could meet each fortnight at the schoolhouse and compare notes and observations. You would find such a club both interesting and profitable.

14. In performing the experiments many puzzling questions will arise as to principles and methods of cropping. If your school farm does not give you the answers, consult the other leaflets of this series. Consult also your teacher, parents, and others, and if you are not fully satisfied, write to me, and I will try to give you the desired information. I will be glad to hear from you at any time, and will be especially pleased to have you report anything of interest in connection with your school farm.

[FOR THE USE OF TEACHERS.]

No. 2.

LEAFLET

ON NATURE STUDY.

ESPECIALLY ADAPTED TO THE USE OF CHILDREN IN SCHOOLS IN RURAL DISTRICTS.

[Prepared by the faculty of Purdue University.]

THE STUDY OF THE FOLIAGE LEAF.

[By Prof. STANLEY COULTER.]

The materials for "nature" study are the nearest and most conspicuous natural objects. These materials necessarily differ with the locality, with the seasons, even from day to day. It will be found, however, that in almost every locality the greater part of these studies will be connected with plant forms. The reasons for this are very apparent. Plants are *living* things and life appeals to the child. The material for the studies is convenient and abundant. Plants have a fixed position, allowing the effect of varying conditions to be readily seen and understood. The life cycle is so short that all of its phases may be observed in a single school year. Beyond this it is to be remembered that plants stand as the visible sign of the agricultural capacity of any region, giving us direct report of the character of its soil and climate; that they are intermediaries between unorganized matter and animal forms, and that they have profound economic importance not merely in furnishing food stuffs, but also in some of their forms, in absolutely conditioning public health. It is, however, because of their abundance and rela-

Digitized by Google

tive ease of preservation in any desired condition that plant forms must naturally furnish the material for a large part of nature studies.

The flowering plants are evidently the most conspicuous plant forms in any region, and of these the foliage leaf is the most conspicuous part. From the earliest spring, when it begins to unfold its blade of delicate green, until it falls clothed in autumnal brilliance, it is the dominating feature of the plant. For this reason this leaflet is intended to suggest how the foliage leaf may be used as an object for nature study in such a way that all work done will have a definite purpose and an equally definite value.

Foliage leaves are so variant in general appearance, in position, in size and general outline, that it seems necessary to determine what characters are common to *all* such organs. The following general characters will be found to apply to all foliage leaves however diverse they may be in appearance:

1. The foliage leaf is a lateral organ of the *stem*. It is found upon no other part of the plant body.

2. The foliage leaf is *characteristically green*, due to the presence of chlorophyll, which is developed only in the presence of sunlight.

3. The foliage leaf is an *expanded organ*, giving the greatest possible surface exposure to light and atmospheric conditions. Other parts of the plants are mass structures, not surfaces.

It is very evident from these common characters that the *foliage leaf is an organ adapted for the light relation*. The value of this conception of the foliage leaf in nature studies can scarcely be overestimated. Its application readily and clearly explains peculiarities of form, of position, of lobing, and the great mass of adaptations characteristic of plants growing under differing conditions. It explains in a general way plant outlines, and will be found to render clear many apparently puzzling conditions.

Before illustrating the above points specifically, it will be well to consider briefly the work of the leaf. This work may be grouped under four heads:

1. *Transpiration*, or the interchanges of moisture between the interior of the plant and the external air. The result of transpiration, which is after all apparently little else than evaporation, is to aid in the transfer to the leaves of the nutrient water taken from the soil by the roots.

2. *Respiration*, or breathing. Those gaseous interchanges between the plant and the air through which oxygen is taken up by the plant and carbon dioxide returned to the air.

3. *Carbon fixation*, or those processes through which, under the influence of light, carbon dioxide taken from the air is broken down, the carbon being retained and built into the tissues of the plant, while a portion at least of the oxygen is returned to the air.

4. *Photo-syntax*, or those processes through which, under the influence of the light, the crude food materials derived from soil and air are transformed into substances suited to the needs of the plant.

While for the purposes of this leaflet only one of these uses, that of transpiration, will be considered, the others have been given to show how essential the light relation is to the foliage leaf if it accomplish its assigned work. The foliage leaf then is not merely an ornamental appendage to the plant, its various peculiarities being considered as the result of chance, but a working organ intimately concerned with the most important duties in the individual life of the plant.

Let us now examine some of the ways in which this light relation is secured. One of the forms, often seen, especially in the early spring, is that known as the "rosette" arrangement. The foliage leaves are apparently arranged radially, lying flat upon the ground, and in the absence of the stem, seeming at first glance quite unlike organs for light relation. Common plants with this arrangement are the mullein and plantain. If the leaves in this arrangement are without

Digitized by Google

leafstalks, it will be found that in almost every case they are broader at the apex than at the base, a form which in definitional botanies is known as spatulate. The successive circles of leaves as they arise from the center are progressively shorter, the broader portions at the apex fitting into the spaces left between the narrowed bases of the leaves of the preceding circle. If the whole rosette be looked at from above it will be seen that scarcely any portion of the lower leaves is shaded by those above, each leaf, by its peculiar form, and the regularly diminishing size of the leaves of succeeding circles, being brought into the most perfect light condition.

In the case of the plantain, where leafstalks are present, the same condition is brought about by the progressive shortening of the leafstalk from the lower to the upper circles of leaves. It is very evident, then, that the "rosette" arrangement is a device for securing the light relation on the part of plants with reduced stems.

Material for illustration: *Common plantain*, earlier leaves of *mullein*, *shepherd's purse*, *dandelion*.

Taking the cases where leaves are found upon a well-developed stem, the most casual examination will show device after device for securing proper light relations. So evident are they that they need not be mentioned in detail, almost every species of plant furnishing its own solution to the problem. If an ordinary erect stem is looked at from above it will be seen that the leaves are arranged in a series of fairly distinct ranks. The number of these ranks is important, since it has a direct relation to leaf form. The greater the number of ranks the narrower the leaves. The smaller the number of ranks the broader the leaves. Facts evidently explained by our conception of the leaf as the organ of light relation.

Thus far it has been assumed that the leaf-bearing stem has been erect. If by any chance or by the necessities of growth it should change from the erect to the horizontal position, it is evident that to secure proper light relations the leaf position must also change. Comparisons of leaf positions upon erect and horizontal stems taken from the same plant will prove of great value in emphasizing the fact that, above all other things, the leaf must have light exposure.

Material for illustration: Erect and horizontal stems of *elm*, *maple*, *linn*, *oak*, *apple*, *peach*, *cherry*, *catnip*, *wild pinks*, *honeysuckle*, or of *any* plant that may be growing near at hand.

I have considered as yet only cases in which the leaves were entire, or with unbroken margins, since these furnished the simplest illustrations. In the case of lobed or dissected leaves, the conditions are somewhat different. In the simpler forms of lobed leaves, the lobing is evidently a device to prevent the shading of underlying leaves. If you recall the ordinary ivy, with its sharply angled leaves, almost geometrical in their regularity, this fact will be evident. If a growing tip of this plant, as it clings to the wall, be carefully flattened down it will be seen that the leaves fit into each other so accurately by means of these angles that on the one hand there is scarcely any perceptible shading, and on the other there is scarcely any space unoccupied by the leaf. Such accurate fitting of leaves when brought to a common plane produce what is known as leaf "mosaics," which simply serve to again prove that the leaf is the organ of light relation. Where the leaves are much dissected, as in the case of the common ragweed, there is the same arrangement in ranks, the same arrangement of leaves in different planes as in the case of the entire leaf, but as a rule no marked diminution in the size of the leaves as we pass from the base to the top of the plant, the constant shifting of the parts of the dissected leaf and the possible play of light through the openings between the leaf parts being sufficient to prevent any portion of the underlying leaf from being continuously shaded.

Material for illustration: *Ivy*, *geranium*, *star cucumber*, *begonia*, *common mallow*, *ragweed*, or any plant with lobed or dissected leaves.

It will be seen, then, that leaf form largely determines the outline of the plant,

Digitized by Google

taken as a whole. Let us return to the mullein for a moment. It will be remembered that the leaves are entire, the lower ones being the largest and standing nearly at right angles to the stem. As the summit is approached the leaves become gradually smaller, and at the same time more closely appressed to the stem, until at the extreme summit they are much reduced and nearly parallel to the stem. This arrangement, so evidently for the purpose of preventing shading of lower leaves, serves to give to the whole plant a general pyramidal outline, a form characteristic of simple plants with *entire* leaves. In the case of the ragweed, on the other hand, since there is no diminution in size of the upper leaves, the general outline of the plan is *cylindrical*, a form characteristic of plants with divided or dissected leaves.

It is evident that in genuine nature work the foliage leaf is to be studied from a new view point. It is not to be used as a frame upon which to hang definitions as to form and margin, apex and blade, but is to be considered as a working organ charged with important duties which can only be successfully performed in the presence of the light. In this view all peculiarities of position and form and structure are but devices for enabling the leaf to properly accomplish its work. The main question in every case concerning the foliage leaf is, "How is the light relation secured?"

Before considering specifically how the view of the foliage leaf as the organ of light relation serves to explain many so-called adaptations to meet special conditions, it is necessary to touch very briefly upon the relation of plants to the soil. It is evident that by far the greater part of the food of the plant is derived from the soil. It is also plain from our knowledge of the structure of the plant that this food must be taken up in the form of a watery solution. It follows, therefore, that the amount of water in the soil has a very important bearing upon the food supply of the plant, and serves, perhaps, more than any other one factor to determine its structural features. Indeed, this matter of the available water of the soil is of such great import that it determines largely not merely the external form of the plant, but also modifies in a marked way its minute structure.

Based upon this dependence of plants upon and their relation to water, the plants of any given region may be separated into three groups, each showing adaptive arrangements to fit it for its place in nature:

1. Water-loving plants, or those plants which live either wholly or partly in water, or else grow in very wet soil, where the water percentage is 80 or above. This is an extreme form of vegetation, and the number of species of plants in this class in Indiana is relatively small. Technically such plants are known as *Hydrophytes*.

2. Dry soil or desert plants, at the opposite extreme from the water-loving plants. These plants grow in dry soil and atmosphere, the water content of the soil being below 10 per cent at its minimum. Such plants are known as *Xerophytes*.

3. Intermediate plants, or those adapted to medium conditions of moisture in air and soil. Such plants are known as *Mesophytes*, and constitute the larger portion of our native flora.

While these differing soil conditions modify the structure of the entire plant, we wish at this time to consider only their effect upon the leaf. It is plain that when a plant lives in an extremely dry soil the water lost by transpiration can be replaced with extreme difficulty, and that if no check were placed upon transpiration the available water in the soil would soon be exhausted and the plant would die. On the other hand, when plants live in the water or in a soil rich in water, the losses from transpiration, however great, can be easily replaced. As the foliage leaf is the chief organ of transpiration, the most evident adaptations to control the process occur in it.

Digitized by Google

Let us consider in what ways transpiration may be checked, and then see if by an application of these facts the foliage leaf will not tell to us the story of the water capacity of the soil:

1. Transpiration may be checked by reducing the *size* of the foliage leaf. Much less water will be evaporated in a given time from a vessel with ten square inches of exposed surface than from one with a surface exposure of one hundred square inches. So, much less transpiration will take place from a small leaf than from a large one. Think of the leaves of the water lily, of the splatter dock, of the skunk cabbage, indeed of any water or marsh plant with which you are familiar, and compare them as to size with leaves of the golden-rods or the mullein or any familiar plant living in a dry soil. You will see at once a marked contrast. In tropical regions, where water is abundant both in soil and air, the foliage leaves are very large, but as we come into the temperate regions the leaves are reduced in size until finally in desert or arctic regions they are so reduced that they almost lose the semblance of foliage leaves.

2. Transpiration may be checked by reducing the *number* of leaves. If you can recall any plant, say a wild rose, and compare one growing in moist soil with one growing in dry soil, you will at once see how often nature makes use of this device to prevent damage by excessive transpiration and to fit the plant to meet its conditions. And in this way, also, the leaf tells us of the water content of the soil. You know farmers and gardeners say that in wet weather their plants all *run to leaf*, which only means that no check need be placed upon transpiration.

3. Transpiration may be checked by *thickening the outer wall* of the leaf. If you compare a leaf of a plant growing in dry soil with that of one growing in very moist soil, the former will in almost every case have the thicker and tougher outer covering. This is one of nature's favorite devices for checking transpiration, and you can scarcely examine a leaf taken from a plant growing in dry soil which will not show it and at the same time tell to you the character of the soil as to its water capacity.

4. Transpiration may be checked by the leaves having a *covering of hairs*. This also is of frequent occurrence in nature. The common mullein is a familiar example of this method of controlling transpiration. This of course is not the only use of hairs, as may be shown in some future leaflet, but it is one of their important uses.

There are other methods of checking transpiration, but we are only concerned with those which are readily apparent and can be used in nature work.

If we compare, then, the foliage leaves of plants growing under dry conditions with those of water-loving plants, the following facts are apparent:

1. The leaves are relatively small.
2. The leaves are often fewer in number.
3. The outer covering of the leaf is thicker.
4. The leaves are often clothed with hairs, which in water-loving plants are almost always wanting.

The intermediate plants show almost all conceivable variations between these extremes and are extremely sensitive to the slightest changes in soil and air moisture, recording these changes in corresponding leaf modifications. The differences in many cases in plants of the same species growing under differing conditions are so marked as to have led to the formation of distinct species, when the plant was merely trying to tell us the story of the soil.

It is not wise, in these studies, to press the work upon a single feature too far. Continued application is an acquirement of age. The endeavor has been to call attention to a few points which may suggest to the teacher how to use the foliage leaf in nature work.

Similar studies, using some other one of the leaf functions as a basis, will doubtless suggest themselves to the teacher as this work progresses. Some of these may be treated in future leaflets should this one prove to be helpful to the teachers of the State.

Digitized by Google

The teacher in the country school has here the greatest advantage over the teacher in the city. God's laboratories are infinitely more complete and more suggestive than man's, and earnest, honest work in these lines will develop in the pupil habits of observation which will not only be of temporary value but will be a permanent possession.

METHODS OF PRESENTATION.

1. *Develop general characters of leaf* (*p. 2*).

This may be done by bringing in abundant material representing different plant forms. Some of the plants should be entire, showing root as well as stem. Have the pupils tell what part of the plant is stem, what part is leaf, and what part is root. This develops easily and naturally the *position* of the leaf. The *color* of the leaf can now be considered and this followed by the leaf as a *flat organ* or *surface*. Tell the pupil to bring to the school any plants in which the leaves are *not* upon the stem, are *not* green, and are *not* expanded surfaces. Such exceptions will be found, but so rarely that the general characters given will be seen to be the rule.

2. *Arrangement of leaves to prevent shading.*

(*a*) Take some simple case, as the maple, the elm, the mulberry, or indeed almost any form with simple and entire leaves, being careful to select *erect* stems. The specimens should be fresh, or the wilting of the leaves may obscure the real relations. Ask if the successive leaves as you pass from base to top of the twig are *directly* over each other. Does this arrangement prevent the shading of the lower leaves by those above? By abundant material of these simple forms have the child see the different ways in which this shading is prevented.

In most cases it may be necessary to suggest to the child to look at the specimen from above and not from the side.

(*b*) Take horizontal stems of the forms studied under (*a*), and have the child report upon the very apparent differences in arrangement. Ask why this difference occurs. If the answer does not suggest itself to the children, repeat the work under (*a*) and (*b*), using different forms. Be careful not to suggest the explanation, but allow the pupil to work it out, even though it seems to take a long time.

(*c*) Take the earlier leaves of the *mullein*, the *plantain*, the *shepherd's purse*, or the *dandelion*. Work out first the "rosette" arrangement. Then lead up to various arrangements for preventing shading. In the hands of the skillful teacher this should not be a difficult task.

(*d*) The case of lobed and dissected leaves had perhaps better be illustrated by the teacher. The common ivy, star cucumber, or any convenient plant with lobed or angled leaves will be found suitable.

3. *The general form of the plant as determined by the leaf.*

(*a*) To show pyramidal form of simple plants with *entire* leaves, take the common mullein, the shepherd's purse, or any plant growing in your region having entire leaves. Have lines drawn from the tip of top leaf to the tip of bottom leaf. What is the shape of resulting figure?

(*b*) To show cylindrical form of plants with dissected leaves, take the ragweed, or any form easily obtained, and proceed as in (*a*). In both cases plants of as many kinds as possible should be examined, in order that the plant form as determined by the leaf may be seen to be the rule and not merely a chance outline. Plants in which branching does not occur, or in which it is very simple, should be chosen, as branches complicate the plant outline and render this point more difficult to work out satisfactorily.

4. *The leaf as indicating differing soil conditions.*

(*a*) Select any water or marsh plants with entire or nearly entire leaves. Suitable forms are water lily, spatter dock, arrow leaf, skunk cabbage, or marsh marigold. Have them examined with reference to size, toughness, and thickness of outer covering of leaf, and presence or absence of hairs.

Digitized by Google

(*b*) Select forms of plants loving dry ground, such as the golden-rods, mustards, some of the smartweeds, indeed, any form growing in dry soil, whether its name is known or not. Examine as to same points as in (*a*). Compare conditions found in (*a*) with those in (*b*).

(*c*) Take some single form, such as the wild rose, which you find growing in moist soil, intermediate soil, and dry soil. Note changes in leaf size, leaf number, character of outer covering, and presence or absence of hairs in specimens growing in these different conditions.

5. *Experimental work.*

(1) To show necessity of light for the development of leaf green.

(*a*) Take two plants, equally vigorous, and place them in pots. Keep one in the sunlight, the other in the dark. Let all other conditions be identical. At the end of a week or ten days what differences are noticeable in the plants?

(*b*) Shade a portion of a vigorously growing leaf by covering with a piece of pasteboard. The pasteboard may be held in place by pins passed vertically through it and the leaf, the small wounds made by the pins not producing any injurious effects. At the end of two or three days remove pasteboard and note results. Expose the previously covered portion to the action of light for a few days and note results. In the case of young children, interest may be added by cutting the shading pasteboard into various patterns.

(2) To show that leaf green is necessary to the growth of the plant.

Continue experiment 1 (*a*) for two or three weeks. Note differences in size and vigor of plants.

(3) To show effect of soil moisture upon plants.

Take vigorous seedlings of Indian corn, beans, peas, or any rapidly growing plant and place in pots. Subject one plant to drought by withholding moisture from it, give to the other abundant water, being careful, however, not to drown the plant. Note the results at the end of one, two, three, and four weeks.

These suggestions are made not as laboratory directions, but merely as indications to the honest teacher of methods by which information may be secured from nature itself without the intervention of text-books. Suggestions which, it is hoped, will lead the teacher to find new meaning in that very common thing, the foliage leaf, and through this to give him the power to advance to a clearer and fuller interpretation of the life about him.

TEACHER'S LEAFLETS.

HOW A CANDLE BURNS.[1]

[By GEORGE W. CAVANAUGH.]

I. OXYGEN.

Light the candle and place it upon a piece of blotting paper.

Ques. What do you see burning?

Ans. The candle; or the wick and wax (or tallow).

---

[1] *To the Teacher:*

This is the second of a proposed series of leaflets designed to suggest methods of presenting nature study upon commonplace subjects. This is a new field of effort for the College of Agri-

Digitized by Google

Ques. Is anything burning besides the candle?

The answer will probably be "no." Well, let us see. Place the lamp chimney over the lighted candle, and partly cover the top by a piece of stiff paper, as in Fig. 15. Ask the pupils to observe and describe how the flame goes out; i. e., that it is gradually extinguished and does not go out instantly.

Ques. Why did the flame go out?

The probable answer will be, "Because there was no air." (If there was no air within the chimney, some could have entered at the top.) Place a couple of pencils beside the relighted candle and on them the chimney as in Fig. 16.

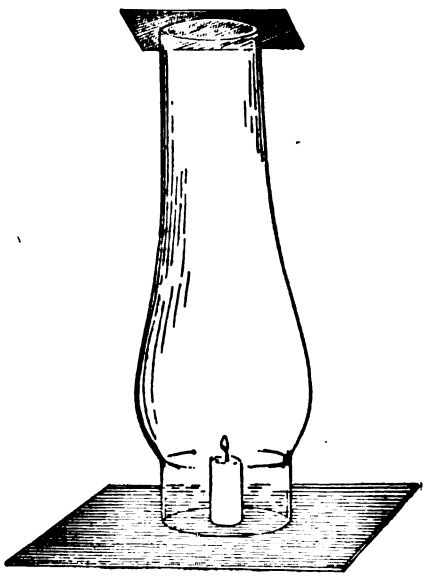

FIG. 15.—The beginning of the experiment.

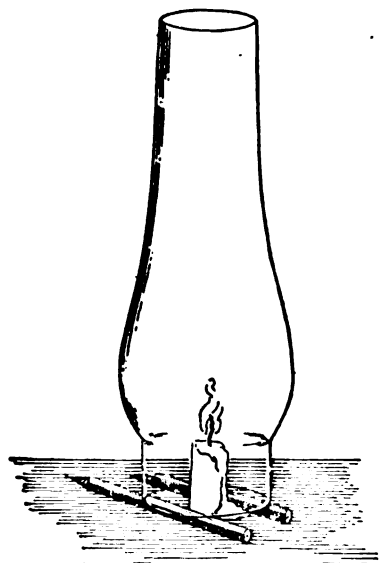

FIG. 16.—Supplying air underneath the chimney.

---

culture, and we therefore look upon the methods as largely experimental. We are endeavoring to determine the best way of interesting children in country life. You can give us many suggestions, and we should like a free expression of your opinions and experiences. It should be borne in mind that the object of these lessons is not to impart direct and specific information, but to train the child in the powers of seeing and inquiring. The teacher should keep the attention of the pupil closely fixed upon the experiments, asking him to describe everything which he sees. Require that the pupil see all that is specified in this leaflet, and endeavor to lead him on to see things which are not here described. Once the inquiry is started, you will no doubt be able to conduct other similar experiments from time to time. If questions come up which you can not answer, write them to us and we may be able to help you.

We suggest that you ask your pupils to write short compositions upon these lessons and to make sketches of the observations, and that you send us some of these from time to time in order that we may learn how the experiment is working. We do not care for the best essays alone, but simply the average. The suggestions which we obtain from teachers will aid us greatly in the preparation of future leaflets. We should particularly appreciate suggestions as to the most useful subjects to be taken up in these tracts.

The materials needed for this exercise are, a piece of candle about 2 inches long, a lamp chimney (one with a plane top is best), a piece of white crockery or window glass, a piece of fine wire about 6 inches long, a bit of quick lime about half the size of an egg, and some matches. All of these, with the possible exception of the quick lime, can be obtained in any household. If you perform the experiment requiring the lime, be sure that you start with a fresh piece of quick or stone lime, which can be had of any lime or cement dealer. During the performance of the following simple experiments ask your pupils to describe to you what they see you do at each step. The questions inserted in the text are offered merely as suggestions in the developing of the desired ideas. The answers, which are intended only for the teacher, are those which it is desired shall be given by the pupils.

Digitized by Google

Ques. What is the difference between the way in which the candle burns now and before the chimney was placed over it?

Ans. It flickers or dances about more.

Ques. What makes boys and girls feel like dancing about when they go out from a warm schoolroom?

Ans. The fresh air.

Ques. What makes the flame dance or flicker when the chimney is raised by the pencils?

Ans. Because it gets fresh air under the chimney.

Repeat the first experiment, in which the flame grows gradually smaller till it is extinguished.

Ques. Why now does the flame die out?

Ans. Because it had no fresh air.

Ques. Is it really necessary to have fresh air in order to keep a flame burning?

Ans. Yes; since otherwise the candle would continue to burn until it is all used up.

To prove this further, let the candle be relighted. Place the chimney over it, now having the top completely closed by a piece of paper. Have ready a lighted splinter or match, and just as soon as the candle is extinguished remove the paper from the chimney top and thrust in the lighted splinter.

Ques. Why does the light on the splinter go out?

Ans. Because there is no fresh air inside the chimney.

Ques. What became of the freshness that was in the air?

Ans. It was destroyed by the burning candle.

Evidently there is some decided difference between fresh air and air from which the freshness has been burned, since a flame can continue to burn only in air that has the quality known as freshness. This quality in fresh air is due to a gas which has the name of oxygen, and which is represented by the letter O.

Ques. Why was the splinter put out instantly, while the candle flame died out gradually?

Ans. When the splinter was thrust in, the air had no freshness or oxygen at all, while when the candle was placed under the chimney it had whatever oxygen was originally in the air within the chimney.

Endeavor to have this point clearly understood: That the candle did not go out as long as the air had any oxygen and that the splinter was extinguished immediately because there was no oxygen left. Relight the candle. Our second question may now be repeated:

Ques. Is anything else burning besides the candle?

Ans. Yes; the oxygen of the air.

When the subject of the necessity of fresh air, and consequently of oxygen, for the burning of the candle seems to be understood, the following questions, together with any others which suggest themselves, may be asked:

What is the reason that draughts are opened in stoves?

Why is the bottom of a "burner" on a lamp always full of holes?

II. Carbon.

Let us now observe the blackened end of a burned match or splinter. This black substance is usually known by the name of charcoal, and if handled will blacken the fingers. Try this. The same substance is found on the bottoms of kettles which have been used over a wood fire, only it is a fine powder.

Let us see what was burning when the candle was lighted besides the oxygen in the air. Relight the candle, and hold the porcelain or glass about an inch above the bright part of the flame.

Ques. What happens to it there?

Next lower it directly into the flame (fig. 17).

Digitized by Google

Ques. What is the black stuff that gets upon the glass?

Look closely and see whether it is not deposited here also as a fine powder.

Ques. Will this deposit from the candle blacken the fingers?

Instead of using the name charcoal for this black substance, let us call it carbon (represented by C), the better name, because there are several kinds of carbon, and charcoal is only that kind which is rather light and easily blackens the hands. Some other kinds are the diamond, coal, and black substance in lead pencils. This last kind is called graphite. These are all much harder than charcoal.

FIG. 17.—The carbon or soot on the glass.

The carbon from the candle flame came mostly from the wax or tallow. Only a very small portion came from the wick.

It can not be seen in the tallow, neither can it be seen in unburned wood, and yet it can be found when the wood is partly burned. The condition in which the carbon exists in the tallow or wood may be explained in a later lesson. At present it suffices that it is there.

Why, now, is the glass blackened when held in the flame and not when held just directly above it? It is because the carbon from the candle has not been completely burned at the middle of the flame, but it is burned beyond the bright part of the flame. When the glass is held in the flame, the carbon that is not yet completely burned is deposited on it, because it is cooler than that in the surrounding flame.

A fine deposit of carbon can be had from any of the luminous parts of the flame: and it is these thousands of little particles of carbon, getting white hot, which glow like coals in the stove and make the light. Just as soon as they are completely burned, there is no more light, the same as coals cease to glow when burned to ashes.

III. CARBON DIOXID.

Let us now inquire what becomes of the carbon that we find in the bright part of the flame and of the oxygen that was in the air in the lamp chimney. When the candle was extinguished within the chimney, there was no oxygen left, as shown by the lighted splinter, which was put out immediately. Neither could any of the particles of carbon be found except on the wick. Yet they both still exist within the chimney, but in an entirely different condition than before. While the candle was burning, the little particles of carbon that we find ascending in the flame are joining with the oxygen of the air and making an entirely new substance. This new substance is a gas like oxygen, and can not be seen in the air.

Ques. Of what two substances is this new substance made?

Ans. Carbon and oxygen.

What shall we call this substance? Since it is made of carbon and oxygen it ought, if possible, to have a name that will show its composition. Its name is carbon dioxid. The words carbon and oxid show of what it is made, and the prefix *di*, which means two, shows that it contains twice as much oxygen as carbon. This is represented by the formula CO_2.

Place the bit of quicklime in about half a glass of water on the day previous to the experiment. When ready for use there will be a white sediment at the bottom and a thin white scum on the top of the clear lime water. Call the attention of the pupils to this white scum, as a question about it will follow. Make a loop in the end of the piece of wire by turning it around the point of a lead pencil. Remove the scum from the lime water with a piece of paper, and insert the loop into the clear water. When withdrawn the loop ought to hold a film of clear water. Pass the wire through a piece of cardboard or stiff paper, and arrange as shown in fig. 18.

Digitized by Google

Place the chimney over the lighted candle. Lower the loop into the chimney and cover the top of the chimney with the paper. Withdraw the wire a couple of minutes after the candle goes out. Note the cloudy appearance of the film of water on the wire. The cloudiness was caused by the carbon dioxid formed while the candle was burning.

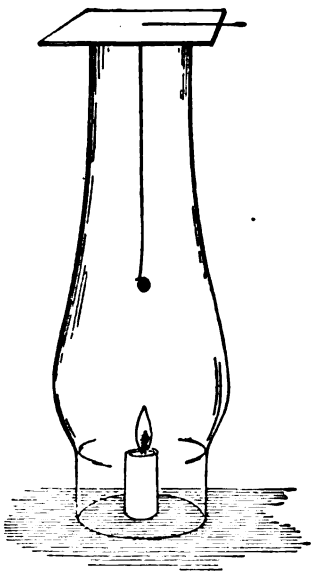

FIG. 18.—The test with the film of lime water.

Omitting the candle, hang the freshly wetted wire in the empty chimney. Let the film of lime water remain within the chimney for the same length of time as when the candle was used. It does not become cloudy now. The cloudiness in clear lime water is a test or indication that carbon dioxid is present.

Ques. What caused the white scum on the lime water which stood over night?

Ans. Some CO_2 in the air.

Ques. How does the CO_2 get into the air?

Ans. It is formed whenever wood, coal, oil, or gas is burned.

The amount of CO_2 in ordinary air is very small, being only three parts in ten thousand. If the lime water in the loop be left long enough in the air it will become cloudy. The reason it clouds so quickly when the candle is being burned is that a large amount of CO_2 is formed. Besides being made by real flames, CO_2 is formed every time we breathe out air. Renew the film of water in the loop and breathe against it gently for two or three minutes.

The presence of CO_2 in the breath may be shown better by pouring off some of the clear lime water into a clean glass and blowing into it through a straw.

An interesting question to end the lesson with is, Why does water put out a fire? The answer is, not alone because it wets, but because it cools the carbon, which must be hot in order to unite with the oxygen, and prevents the oxygen of the air from getting as near the carbon as before.

FOUR APPLE TWIGS.

[By L. H. BAILEY.]

The other day, as I walked through an apple orchard for the first time since the long winter had set in, I was struck by the many different shapes and sizes of the limbs as I saw them against the blue-gray of the February sky. I cut four of them in passing, and as I walked back to the house I wondered why the twigs

Digitized by Google

were all so different, and I found myself guessing whether there would be any apples next summer.

Now, I have had pictures made of these four little apple limbs. Let us look them over and see if they have any story to tell of how they grew and what they have set out to do.

I.

One of these twigs (fig. 19) was taken from a strong young tree which, I remember, bore its first good crop of apples last year. This simple twig is plainly of two years' growth, for the "ring" between the old and new wood is seen at B. That is, the main stem from the base up to B grew in 1895 and the part from B to the tip grew in 1896. But the buds upon these two parts look very unlike. Let us see what these differences mean.

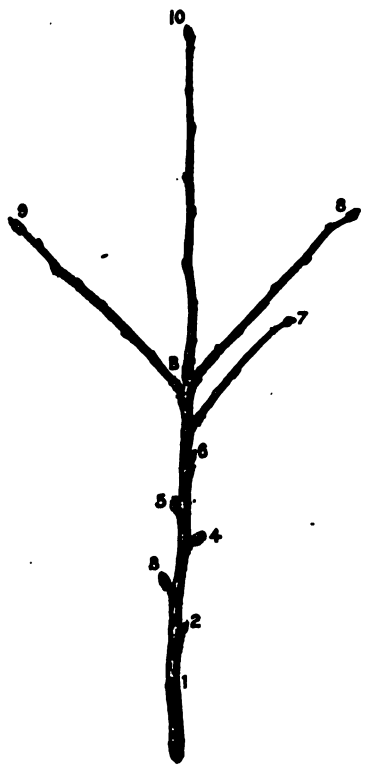

FIG. 19.—A two-year-old shoot from a young apple tree. Half size.

We must now picture to ourselves how this shoot from B to 10 looked last summer whilst it was growing. The shoot bore leaves. Where? There was one just below each bud; or, to be more exact, one bud developed just above each leaf. These buds did not put out leaves. They simply grew to their present size and then stopped.

What are these buds of the tip shoot proposing to do in 1897? We can answer this question by going back just one year and seeing what the buds on the lower (or older) part of the shoot did in 1896. Upon that part (below B) the buds seem to have increased in size. Therefore they must have grown last year. There were no leaves borne below these buds in 1896, but a cluster of leaves came out of each little bud in the spring. As these leaves expanded and grew, the little bud grew on; that is, each bud grew into a tiny branch, and when fall came each of these branches had a bud on its end to continue the growth in the year to come. What we took to be simple buds at 2, 3, 4, 5, 6 are therefore little branches.

But the strangest part of this wonderful little twig has not yet been seen—the branches are of different sizes, and three of them (7, 8, 9) have so far outstripped the others that they seem to be of a different kind. It should be noticed, too, that the very lowermost bud (at 1) never grew at all, but remained perfectly dormant during the entire year 1896. It will be seen, then, that the dormant bud and the smallest branches are on the lower part of the shoot and the three strong branches are at the very tip of the last year's growth.

If, now, we picture the twig as it looked in the fall of 1895, we will see that it consisted of a single shoot, terminating at B. It had a large terminal bud (like those at 7, 8, 9, 10), and this bud pushed on into a branch in 1896, and three other buds near the tip did the same thing.

Why did some of these branches grow to be larger than others? "Simply because they were upon the strongest part of the shoot, or that part where the greatest growth naturally takes place," some one will answer. But this really does not answer the question, for we want to know why this portion of the shoot

Digitized by Google

is strongest. The real reason is because there is more sunlight and more room on this outward or upward end. In 1897, if this shoot had been spared, each of these four largest twigs (7, 8, 9, 10) would have done the same thing as the parent twig did in 1896; each would have pushed on from its end, and one or two or three other strong branches would probably have started from the strong side buds near the tips, the very lowest buds would, no doubt, have remained perfectly inactive or dormant for lack of opportunity, and the intermediate buds would have made short branches like 2, 3, 4, 5, 6. In other words, the tree always tries to grow onward from its tips, and these tip shoots eventually become strong branches, unless some of them die in the struggle for existence. What, now, becomes of the little branches lower down?

II.

From another apple tree I took the twig shown in fig. 20. We see at once that it is very unlike the other one. It seems to be two years old, one year's growth extending from the base up to 7, and the last year's growth extending from 7 to 8; but we shall see upon looking closer that this is not so. The short branchlets at 3, 4, 5, 7 are very different from those in fig. 19. They seem to be broken off. The fact is that the broken ends show where apples were borne in 1896. The branchlets that bore them, therefore, must have grown in 1895, and the main branch, from 1 to 7, grew in 1894. It is plain, from the looks of the buds, that the shoot, from 7 to 8, grew last year, 1896.

FIG. 20.—A three-year-old shoot and the fruit spurs. Half size.

Starting from the base, then, we have the main twig growing in 1894; the small side branches growing in 1895; these little branches bearing apples in 1896, and the terminal shoot also growing in 1896. Why was there no terminal shoot growing in 1895? Simply because its tip developed a fruit bud (at 7) and therefore could not send out a branch; for there are two kinds of buds—the small, pointed leaf bud and the thick, blunt fruit bud. If the branchlets, 3, 4, 5, 7, are two years old, the dormant buds—1, 2—must be of the same age. That is, for two long years these little buds have been waiting for some bug to eat off the buds and leaves above, or some accident to break the shoot beyond them, so that they might have a chance to grow; but they have waited in vain.

We have now found, therefore, that the little side-shoots upon apple twigs become fruit branches or fruit spurs, whilst the more ambitious branches above them are making a great display of stem and leaves.

But will these fruit spurs bear fruit again in 1897? No. The bearing of an apple is hard work, and these spurs did not have enough vitality left to make fruit buds for the next year; but they must perpetuate themselves, so that they have sent out small side buds which will bear a cluster of leaves and grow into another little spur in 1897, and in that year these new spurs will make fruit buds for bearing in 1898. The side bud is plainly seen on spur 5, also on spur 4, whilst spur 7 has sown a seed, so to speak, in the bud at 6. It is therefore plain why the tree bears every other year.

Digitized by Google

III.

There was one tree in the orchard from which the farmer had not picked his apples. Perhaps the apples were not worth picking. At any rate, the dried apples, shriveled and brown, are still hanging on the twigs, and even the birds do not seem to care for them. I broke off one of these twigs (fig. 21). Let us see how many apples this curious twig has borne. We can tell by the square-cut scars. An apple was once borne at 1, another at 2, another at 4, another at 5, another at 6, and another at 7; and at 7 there will be a scar when the apple falls. Six apples this modest shoot has borne! And I wonder how many of them got ripe, or how many were taken by the worms, or how many were eaten by the little boys and girls on their way to school.

A curious thing happened when the fruit was growing at 2. Two side buds started out, instead of one, and both of them grew the next year. But one of the little branchlets fell sick and died, or a bug nipped off its end, or it starved to death; and the grave is still marked by the little stick standing up at 3. The other branchlet thrived, and eventually bore apples at 4, 5, 6, and 7.

I have said that these fruit spurs bear only every other year; then, if this branch has borne six apples, it must be twelve years old. The truth is that it is

FIG. 21.—A fruit spur which has borne six apples. Half size.

about twenty years old, for some years it failed to bear; but the age can not be traced out in the picture, although any little boy or girl with bright eyes could soon learn to trace out yearly rings on the shoot itself.

IV.

The last shoot which I got that day has a whole volume of history in it, and I can not begin to tell its story unless I should write a small book. But we will trace out its birthdays and see how many apples it has borne. It is shown in fig. 22, and because it is so long I have had to break it in two several times to get it on the page. It begins at A, and is continued at B, C, D, E, and F.

Let us count the yearly rings and see how old the whole limb is. These rings are at 28, 26, D, 12, 1—five of them; and as the shoot grew one year before it made any ring, and another year made no increase in length—as we shall presently see—the whole branch must be seven years old. That is, the limb probably started in 1890.[1] Let us begin, then, at A and follow it out.

1890. Started as a spur from the main branch A, and grew to 1.

1891. Apple borne at 1. This apple did not mature, however, as we can readily

[1] It is really impossible to tell whether the shoot started from the limb A in 1889 or 1890, without knowing the age of A, for the spur may have developed its blossom bud at the end in either the first or second year of its life; that is, young fruit spurs sometimes make a blossom bud the very year they start, but they oftener "stand still" the second year and delay the blossom bud until that time.

Digitized by Google

see by the smallness of the scar. In this year, two side buds developed to continue the spur the next year.

1892. Gave up its desire to be a fruit spur, and made a strong growth on to 12. For some reason it had a good chance to grow. Perhaps the farmer pruned the

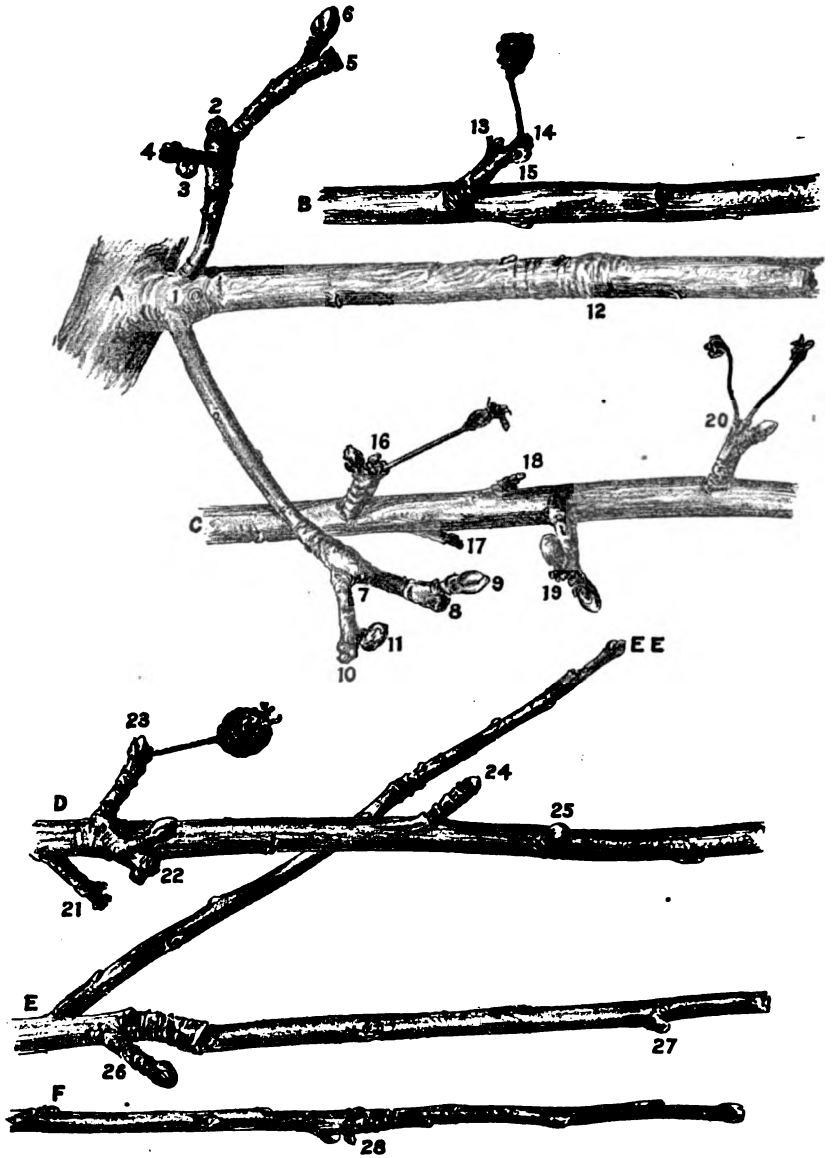

FIG. 22.—A seven-year-old apple twig and its curious history. Half size.

tree and thereby gave the shoot an opportunity; or perhaps he plowed and fertilized the land. In the meantime one of the side buds grew to 3, and the other to 7, and each made a fruit bud at its end.

1893. Shoot grew lustily—on to D. The fruit bud at 3 bore an apple, which probably matured, as shown by the scar 2. Two side buds were formed beneath

Digitized by Google

this apple to continue the spur next year. The fruit bud at 7 bloomed, but the apple fell early, as shown by the small scar. Two side buds were formed. The buds upon the main shoot—1 to 12—all remained dormant.

1894. Shoot grew from D to beyond E. Side bud of 2 grew to 4, and made a fruit bud on its end; the other side bud grew on to 5, and there made a fruit bud. Side bud of 7 grew on to 10, and the other one to 8, each ending in a fruit bud. Buds on old shoot—1 to 13—still remained dormant. Some of the buds on the 1893 growth—12 to D—remained dormant, but some of them made fruit spurs—14, 16, 17, 18, 19, 20, 21, 22, 23.

1895. Shoot grew from beyond E to 28. Flowers were borne at 4 and 5, but at 4 the fruit fell early, for the five or six scars of the flowers can be seen, showing that no one of them developed more strongly than the other; that is, none of the flowers "set." A fairly good fruit was probably borne at 5. At the base of each a bud started to continue the spur next year. Upon the other spur flowers were borne both at 8 and 10. At 10 none of the flowers set fruit, but a side bud developed. At 8 the fruit partially matured, and a side bud was also developed. The buds upon the old stem from 1 to 12 still remained dormant. Some of the spurs on the 1893 growth—12 to D—developed fruit buds for bearing in 1896. Some of the buds on the 1894 growth—D to beyond E—remained dormant, but others developed into small fruit spurs. One of these buds, near the top of the 1894 growth, threw out a long shoot, starting from E, and the bud at 26 also endeavored to make a long branch, but failed.

1896. Main shoot grew from 28 to the end. The side bud below 4 (where the fruit was borne the year before), barely lived, not elongating, as seen above 3. This branch of the spur is becoming weak and will never bear again. The side bud of 5, however, made a fairly good spur, and developed a fruit bud at its end, as seen at 6. The side bud of 10 grew somewhat, making the very short spur 11. This branchlet is also getting weak. The bud of 8, however, developed a strong spur at 9. Both 11 and 9 bear fruit buds, but that on 11 is probably too weak ever to bear fruit again. In fact the entire spurs, from 1 to 6 and 1 to 9, are too weak to be of much account for fruit bearing. This year several of the spurs along the 1893 growth—12 to D—bore flowers. Flowers were borne from two buds on the first one (at 13 and 14), but none of the flowers "set." One of the little apples that died last June still clings to the spur, at 14. A side bud, 15, formed to continue the spur in 1897. Flowers were borne at 16, 20, 21, and 23, but no apples developed. Upon 16 and 20 the flowers died soon after they opened, as seen by the remains of them. Upon 23, one of the flowers set an apple, but the apple soon died. The spurs 17 and 18 are so weak that they have never made fruit buds, and they are now nearly dead. The spurs 19 and 22 have behaved differently. Like the others, they grew in 1894, and would have made terminal fruit buds in 1895, and would have borne fruit in 1896; but the terminal buds were broken off in the fall or winter of 1894, so that two side buds developed in 1895, and each of these developed a fruit bud at its end in 1896 in the spur 19, but only one of them developed such a bud in 22. Upon these spurs, therefore, the bearing year has been changed. Upon the growth of 1894—D to beyond E—only three spurs have developed, Nos. 24, 25, and 26. These started out in 1895, and two of them—25 and 26—have made large, fat buds, which are evidently fruit buds. The shoot at E grew on to EE, and all the buds on its lower two-year-old portion remained dormant. On the 1895 growth—from beyond E to 28—all the buds remained dormant save one, and this one—27—made only a very feeble attempt to grow into a spur.

The buds upon the 1892 growth—1 to 12—are still dormant and waiting for an opportunity to grow.

What an eventful history this apple twig has had! And yet in all the seven years of its life, after having made fifteen efforts to bear fruit, it has not produced

Digitized by Google

a single good apple! The fault, therefore, does not lie in the shoot. It has done the best it could. The trouble has been that the farmer either did not give the tree enough food to enable it to support the fruits, or he did not prune the tree so as to give the twig light and room, or he allowed apple scab or some other disease to kill the young apples as they were forming. I am wondering, therefore, if, when trees fail to bear, it is not quite as often the fault of the farmer as it is of the trees?

FOR THE USE OF TEACHERS.

No. 4.

LEAFLET

ON NATURE STUDY.

ESPECIALLY ADAPTED TO THE USE OF CHILDREN IN SCHOOLS IN RURAL DISTRICTS.

[Prepared by the faculty of Purdue University.]

THE CARE OF DOMESTIC ANIMALS.

[By Prof. C. S. PLUMB.]

The purpose of this little leaflet is to aid in training the powers of observation of children by studying the animal life of their daily surroundings at home. Enough suggestions are given to the teacher in this to enable one to discuss several phases of such life with the children, and inspire them with an ambition to become more familiar with the daily needs and welfare of farm animals.

Once upon a time, over a century ago, there lived in England a little boy by the name of Robert Bakewell. He lived with his parents in a stone house and helped take care of the horses, cattle, sheep, and swine on the farm. He showed an unusual interest in all of the live stock, and was with them much of his time. As he grew in years, so his interest in farm animals increased. He was rather a reticent fellow and kept his thoughts to himself. But he was a great thinker and observer. He saw that the people about him had many animals that were unworthy of their keeping. The stock grew slowly, ate much expensive food, were of ill shape, and were not profitable to their owners. And so after giving this matter much thought, Robert Bakewell began the work of improving the farm animals of his locality, in the county of Leicester. Horses, cattle, and sheep he resolved to improve to a higher standard of excellence. His neighbors laughed at him, but he was not diverted from his self-assumed task. For years he worked at his problems, and finally he placed before the admiring world the improved English cart horse, long-horn cattle, and Leicester sheep. Then Bakewell was honored, even beyond the shores of Britain, and in later days he became known as "the father of the improved live-stock husbandry."

Note to the teacher.—You will notice that part of the leaflet is printed leaded, or with the lines far apart, and a part of it not leaded. The teacher should use his discretion in the use of the closely lined matter. In most cases it will be necessary to simplify it to meet the comprehension of the children. The leaded matter may be read to the children or presented orally just as it is. It, however, admits of unlimited amplification and discussion. In presenting it the previous knowledge and experience of the children should be drawn upon so far as possible. It is suggested that this leaflet affords material enough for a great many lessons, and that part of it should be used in the summer and part in the winter.

What led to Bakewell's success?

A natural love for animals. The faculty of observation. An ambition to improve that which he thought was inferior. The use of better methods. Persistency of purpose.

Are not all these qualities found to some degree in you? Do not the boys and girls of the farm, more often than not, love the animals with which they come in con-

Digitized by Google

tact? How can this love be turned to account as a means of education in one direction and animal betterment in another?

Let us see. Robert Bakewell, as one engaged in caring for and improving farm animals, believed in three things:

(1) Stabling or shelter;
(2) Proper feeding and watering; and
(3) Gentle treatment.

Have you ever thought what a highly developed being the improved farm animal of to-day is? Did he not once run wild and independent? Has not the will of man greatly improved the horse, ox, cow, and pig since the days when they roamed wild? Seventy-five years ago the fastest horses could hardly race a mile in three minutes. Do you know what the fastest record is to-day? Where cattle run wild they produce only enough milk to raise their calves on. How much milk has the best cow you have ever heard of given in a year? In some parts of the country where the pigs run wild and have no care they are so thin and have such long legs that they call them "razorbacks," and they can almost outrun the fastest dogs. How do the best looking pigs that you see on our farms and at our fairs look, compared with a "razorback?"

Yes, it is true the farm animal of to-day is an artificial one, composed of either nerves, muscle, meat, or wool, and over which man has a wonderful power if he but knew it. Once shelter and care would have been an injury; now are more frequently a necessity. And so you should know the real necessity of giving farm animals the care that humanity and economy make desirable.

Would it not be well to look into the necessity of these things? Suppose we consider some phases of the lives of farm animals that we might give attention to and thereby add to the comfort of dumb beasts, while adding to our own knowledge of life.

Stabling or shelter.—All animals require protection from the changes of weather or other conditions to a greater or less extent. In the severe cold of winter or the heat of summer what do most animals naturally do? Do they seek for shelter? Is it for this reason in part that sheds or barns are erected? How do cattle look as they stand in the cornfields or barnyard on a cold, cloudy day in January, with a strong wind blowing? On the great prairies cattle seek the protection of groves or windbreaks, where other shelter is not provided. In the cooler northern part of the country in winter, as in Indiana, for example, the humane and wise man provides comfortable barns or warm sheds in which his stock may be housed.

Is this important? Let us see.

Some years ago the writer conducted an experiment at the Indiana experiment station at Purdue, to see if shelter was desirable for animals in winter. Six cows were used. Three of these were given shelter from all kinds of disagreeable weather, while three were kept out, exposed to all sorts of conditions during the day, the only shelter provided being a small shed open on two sides. This experiment showed several things: First, that the exposed cows produced less milk each day than the sheltered; second, the exposed cows lost in weight, while those given shelter gained; third, the exposed cows ate more food than the sheltered ones; fourth, from the financial side, the sheltered cows showed nearly $13 more to their credit than did the exposed ones.

The animal body is something like the boiler of an engine. The food is the fuel which creates the energy to make the body go. If this body is exposed to severe cold, then more food or fuel is necessary to keep the system up, and so the cost for food is increased.

Another thing should never be lost sight of, and that is that it is cruel to expose animals to intense cold without for hours at a time. Even in summer, when there is no breeze and the heat is excessive, all kinds of farm stock will suffer if they can not secure shelter of some kind from the sun's rays.

Suppose that we make some observations on the subject of shelter. Turn one of the horses or cows out of doors in cold winter weather, and note how it affects the appearance and the appetite. When it is stormy in winter, if possible, compare the condition of wool and skin of a flock of sheep out of doors with those kept in shelter. Ask the man who buys and sells wool what kind of a fleece is

Digitized by Google

most valuable, the one from sheep running in the rain and snow or the one kept in the dry shed. In summer place some pigs in a field exposed to the sun, where they can get no shelter, and compare their appearance and comfort with those lying in the shade. In warm weather, when flies are biting badly, begin to weigh the milk of four cows morning and night. Now, turn two of these into the pasture and keep two in a darkened stable, and see what is the influence on the milk yield and comfort of the different animals.

Food and feeding.—All true lovers of animals enjoy watching them eat. In the great zoölogical gardens crowds assemble to see the lions eat and to feed the monkeys peanuts and candy. There is a sense of pleasure in watching our farm animals with hearty appetite eating their grain in the manger. The most successful feeders study the appetites of their stock and enjoy giving changes of diet and noting the relish shown by the animal in eating of it.

Of the foods fed, horses prefer oats or corn. Cattle and sheep relish both of these, as well as bran and oil meal, while pigs enjoy corn or shorts or middlings best. In fact, a large share of the pigs grown in the United States are fed on corn or its products.

All classes of stock, however, enjoy and need herbage in some form, either dry or green. Horses are usually fed timothy hay and cattle clover and corn fodder, green or dry, while sheep need clover or some kind of fine grass, as, for example, Kentucky blue grass. This last is the best pasture grass we have, though for pigs nothing is better than green clover.

Now that we know what foods are used, how shall the animals be fed? Shall they be fed at any regular hours? Is there a good and a bad way to feed? Suppose we say that the best way to feed horses is to give them water first, then some grain, and last, hay. Is that right? Is that the way you do at home? I think horses should be watered before eating. That is so they will not wash their food down before they have ground it up well in the stomach. But suppose you ask a few men you know, who have horses, when they give them water and report on this subject.

Cattle are usually fed their grain first, and then the hay, or coarse fodder, or pasture. Horses and cattle must be fed morning, noon, and night, although grain is not usually fed cattle at noon. Much, however, depends upon circumstances, for horses that are hard worked, or cattle that are being fattened or heavily milked, require more nutriment than do others. Sheep and pigs should be fed at morning and night; but if being fattened it is best to feed them three times a day.

It is important that all kinds of stock be fed only such an amount as will be entirely eaten, and with a relish, especially the grain. With some coarse hays or clover there always is necessarily some woody material left uneaten.

Here is a good chance to make some observations. What do the live stock you are acquainted with eat? How much is fed them of this or that? At what hours of day are they fed? Do you know how fast they grow? There are sheep and pigs on many farms where simple feeding experiments might be conducted. Let us take two lambs about the same size, and feed one corn meal and the other ground oats, and see which will grow the best. We should have scales, and the lambs should be weighed occasionally, say once a week, and an accurate record kept of the growth, as well as of the amount of food eaten each week. Then, in a few weeks, it will be interesting to report on the gain in weight, how many pounds of grain were eaten, its value, and which cost the most. Will it not be easy to feed the calves the skim milk for a few weeks, weighing or measuring what they drink of it, and then report on the amount of such food a calf needs each day to grow well? Can you not show how much each 100 pounds of skim milk is worth when fed to calves or pigs? Feed them the milk, weighing what you give daily, and keeping a record of the weights of the pigs or calves. How much grain do some cows eat daily that make large amounts of milk? Will such a cow give less milk if she is fed less grain?

Watering.—Few people realize how important it is that farm animals should be watered properly. In winter they suffer most, from having to drink from icy pools or troughs, so that if they get enough to satisfy thirst, they are frequently chilled all through. With cold air all about the exterior of the body and ice water

Digitized by Google

within, the temperature of the body is reduced, and then more food (fuel) is required in the furnace to warm up the body to the necessary point again.

Do you think animals prefer warmed water in winter? Mr. Gurler, in his book, American Dairying, tells of a case where some young heifers jumped into a water trough to get where the water was coming warm from a pipe. He says his cows, when given water slightly warmed, keep in better condition and give more milk. I have seen cows go to a stream of water flowing along icy shores and drink and then stand humped up and shivering as though suffering from ague. They were chilled through.

A cow will easily drink 50 pounds a day of water at a temperature of 60 degrees, but if at 35 degrees, she will not drink all she needs, and will turn away chilled, yet thirsty. Do you know how a cow looks containing 50 pounds of ice water?

Teach the necessity of giving the farm stock water that is pure and clean, and which in winter has the chill removed from it. Filthy water usually carries disease germs and may cause serious sickness. Thousands, yes millions, of pigs have died from disease through drinking water that was contaminated with cholera germs. The sheep and pig need as pure water to drink as the horse or cow, and they require plenty of it at all times.

Would you not be interested to learn something about this important subject? How much will our farm animals drink at a time? A bucket of water on the scales may be weighed before and after drinking. Will more warm water be drunk than cold? Place a pail of very cold and one of very slightly warm water before the horse on a cold winter day and see which he will drink first. How much water does a sheep drink at a time? How much water will a horse drink in a week? Will a horse that is working hard drink more than one standing in the stable? How much more water will a large horse drink than a small one? Do you know of any men who have heaters in their water troughs in winter, so that their stock may have warm water? If so, ask them how they like these heaters.

Gentleness is a most important thing to observe when among animals if one desires to secure the best results in handling them. The man who has the pigs under his feet whenever he goes into the lot where they are by his quietness and gentleness has taught them that he is their friend. Such a person usually knows how to feed profitably and raise stock successfully. The man who sits by the nervous cow and quietly soothes her with a gentle voice while milking, instead of using harsh measures, secures more milk and enjoys the company of the beast more than would the man who would "teach her a lesson." No dumb animal was ever improved in disposition or made more profitable to the owner by the adoption of brutal or unnecessarily severe measures. The most successful feeders of stock are invariably gentle in handling their animals. The man who succeeds in getting the greatest speed out of a horse on the race track is the one who rules by love, not fear.

[Bulletin 120, Cornell Agricultural Experiment Station.]

THE MOISTURE OF THE SOIL, AND ITS CONSERVATION.

[By L. A. CLINTON.]

The conservation of soil moisture is one of the most important problems presented to the farmer and gardener. Hardly a season passes in which some important crop is not reduced in yield from twenty-five to seventy-five per cent because of lack of sufficient moisture to bring it to maturity. The soil may have been put in proper condition, plant food may have been supplied in the form of fertilizers, and all other conditions may have been favorable for the development of a full crop, yet with the supply of moisture deficient all this labor and expense count for little or nothing. The questions, therefore, arise, "To what extent can the amount of soil moisture be controlled?" "Is it possible to do anything to save crops from the oft-recurring droughts?"

The insufficient water supply is not due to lack of rainfall, but to its unequal distribution. The average annual rainfall in New York for the last twenty years is 37.52 inches. The lowest rainfall ever recorded in the State was in 1879, when

Digitized by Google

only 19.74 inches fell. In 1895 there was also a deficiency, only 28.66 inches being recorded. In the arid portions of Kansas a rainfall of 20 inches which is well distributed is reasonably sure of making a good crop. The loss there by surface drainage is, however, very slight, it being estimated at not more than ten per cent, or about 2 inches, leaving 18 inches for crop growth. In New York, with a rainfall of from 34 to 40 inches, nearly one-half passes off by surface drainage and is lost so far as immediate plant growth is concerned. Not only is the water lost to the crops, but it carries with it much of the soluble plant food of the surface soil. This, then, would suggest one important step in the attempt to store up moisture. This surface flow of water must be prevented and caused to sink into the soil to supply a reservoir from which plants can secure moisture during the period of growth.

HOW THE SOIL HOLDS ITS WATER.

That a proper understanding of the question may be reached, it is necessary to have a knowledge of the conditions under which water exists in the soil, and of the part it plays in the mysterious operations of plant growth. Water may be in one of three forms—as free, capillary, or hygroscopic water. The free water of the soil is that which flows under the influence of gravity. It is the source of supply for wells and springs. It is not directly used by plants, and its presence in the soil within eighteen inches of the surface is detrimental to the growth of most cultivated crops. It is valuable, however, because it is the supply from which capillary water is drawn.

The capillary water does not flow by gravity. It is the direct source of moisture for plants. It may be either drawn upwards or it may pass downwards, depending upon whether the soil is drier at the surface or below. In time of droughts the capillary action of the soil may be sufficient to raise the water through a distance of five or six feet, its power in this respect depending directly upon its physical condition. If the soil is coarse and cloddy and the particles are not compact, then the water can not rise to take the place of that which is carried off by evaporation or used up by plants in their growth. If, however, the soil is fine, in good condition, and homogeneous, the water passes freely and continuously to the surface. Notice the track of the horse on the plowed ground or the footprint of the driver, and see how the moisture comes directly to the surface, because the soil has been compacted and there is intimate capillary relation between its particles. This moist surface shows that the water is passing off from it into the air. This observation should teach a lesson. The soil may be pulverized and made compact, but the capillary pores near the surface must be enlarged by tillage so as to break the capillary connections and stop the water in its upward course, and thus force it to pass off through the tissues of the plant. This loose surface stratum, two or three inches deep, is the "soil mulch" (fig. 1), of which so much has been said in recent writings.

FIG. 1.—The soil mulch.

It is the one most important means of preventing the loss of water from the soil. It breaks off the capillary pores in the soil structure and interposes between the lower moist soil and the air a layer so loose that the water cannot rise through it. This mulch may itself dry to dust, but it nevertheless protects the soil below. When soils become baked, the minute capillary pores connect directly with the atmosphere and the evaporation of water is very rapid. Hence it is exceedingly important that the crust be broken after every rain.

The hygroscopic water of the soil flows neither under the influence of gravity nor capillarity. It is held firmly in place upon the particles of soil, and can only be driven off by a high degree of heat. Just how important this water is in the

Digitized by Google

growth of plants has not been determined, but it is probable that during severe droughts it may assist in carrying the plant over, enabling it to maintain itself until capillary action is restored.

THE NECESSITY OF WATER FOR GROWING PLANTS.

The importance of water to the growing plant can only be understood when we apprehend and appreciate how large a part of its structure is composed of water, and that even this large percentage of its composition is but a fraction of the total amount used in its development. The quantity of water entering into the structure of plants varies from sixty to as high as ninety-eight per cent of their total weight. During the entire period of growth there is a constant giving off of moisture by the foliage, and it must be made good by that which is taken up by the roots. By experiments conducted at the Wisconsin Experiment Station it has been found that in raising oats, for every ton of dry matter produced there were required 522.4 tons of water; for every ton of dry matter of flint corn there were required 233.9 tons of water; for dent corn, 309.8 tons of water for every ton of dry matter. On plots at this station, 1.8 tons of dry matter of oats per acre represented an expenditure of 940.32 tons of water. Potatoes used 422.7 tons of water per ton of dry matter. The yield of potatoes on the experiment plots of 450 bushels per acre, during the dry season of 1895, represented an amount of water equal to 1,310.37 tons.

FIG. 2.—A corn plant, showing the intimate relation between the roots and the soil particles. From life.

Just why so much water is required by the growing plant and how it obtains this supply is not usually understood. It has been the subject of considerable research and even now presents interesting problems for further study. The roots of the plant are its feeders, and all the water ordinarily used by it passes in through these channels. The particles of soil hold a film of water in firm contact. The roots and rootlets of the plant, in burrowing through the soil, come into intimate relation with these soil particles (fig. 2). The finer the soil, the closer the relation established between it and the roots. The roots are thus surrounded by a thin film of water, a portion of which they are able to absorb. The water passes up through the tissues of the plant, carrying with it soluble plant food which is conveyed to the manufacturing or elaborating organs, the leaves. There, in the presence of sunlight, the fixation of carbon from the air takes place, and by means of the movement of the sap the now organized material is carried to all growing parts of the structure. That part of the water no longer required passes off through the breathing pores of the leaf, called stomata. As evaporation is a cooling process, there is no doubt that this loss of water has an important influence in lowering the temperature of foliage and in promoting the fixation of carbon.

As already stated, the plant roots can absorb food only in the soluble form, and the passage of a large quantity of water through their tissues is necessary to furnish the supply of mineral elements required by growth. Not only is a large quantity of moisture demanded for the direct use of the plant, but its presence in the soil is necessary in order that the plant food may be rendered available. Few soils are so lacking in fertility that they would not grow crops could the mineral

Digitized by Google

plant food which they contain be unlocked and brought into fit condition for use. This important operation, as well as nitrification—or the conversion of nitrogen compounds into the form of nitrates—can proceed only in the presence of moisture. Crops plowed under for green manuring, and barn manures, can be made available only when there is sufficient moisture in the soil to cause breaking down and decomposition. With moisture in the soil, there is a constant movement towards the plant roots to restore the equilibrium, or to make good that used by the plant. This movement of the moisture brings to the roots the soluble plant food. * * * Supply the plant with moisture, and its roots are able to set free from the particles of the soil a part of the mineral elements required for its growth. Supply even our sandy desert plains with abundant moisture, and immediately they change from a desert to a garden.

An acre of soil to the depth of 1 foot weighs approximately 1,800 tons. If 25 per cent of this is moisture, we should have 450 tons of water per acre. An acre of soil to the depth of 8 inches weighs about 1,200 tons. If 25 per cent of moisture were found here it would contain per acre 300 tons of water. Plants can maintain themselves with as low as 5 per cent of water, but their growth seems to go on most rapidly in soils whose water content is from 13 to 25 per cent.

THE CONSERVATION OR SAVING OF MOISTURE.

* * * * * * *

The means by which moisture may be conserved is as follows: By plowing and tilling, mulches, underdrainage, lessening the influence of winds, applications of lime, salt, etc., rotation of crops to increase humus, adapting the crop to the soil.

Plowing to save moisture.—As already indicated, the first step in the conservation of moisture must be the preparation of the soil so that the rain will sink down and not be carried off by surface drainage. * * *

The improvements in the plow have done much toward accomplishing this, but there is still much ignorance as to the proper use of this implement. As an implement to be used in the preparation of the soil for the reception of moisture it stands preeminent. Good plowing does not consist, as ordinarily supposed, in merely inverting a portion of the earth, but in pulverizing and fining it and burying the sod or refuse which may be on the surface. The amount of water which a soil is capable of holding depends directly upon the fineness of its particles. Then, that plow which will break and pulverize the soil most thoroughly is the one best adapted to fit the soil for holding moisture. * * * King found the rate of percolation from soils of different degrees of fineness to be as follows, the column of soil being 8 feet in height:

Time of percolation.

Size of grains.	Per cent lost in 1 hour.	Per cent lost in 2 hours.	Per cent lost in 24 hours.	Per cent lost in 48 hours.
Inch.				
0.186	9.10	10.45	13.05	13.52
.073	7.95	9.47	12.31	12.72
.061	6.22	9.21	11.71	11.53
.045	1.76	2.83	7.64	8.44
.032	1.28	1.91	5.83	6.79

* * * * * * *

Harrowing to save moisture.—The harrow, besides pulverizing and fining the soil for the seed bed, is most efficient in furnishing a soil mulch. The spring-tooth harrow is in reality a cultivator and its action is similar to that of the cultivator. When used as an instrument to conserve moisture, the teeth should penetrate to

Digitized by Google

the depth of about 3 inches, and to produce the best effect the ridges left by it should be leveled off by a smoother, which can now be purchased as an attachment to the harrow. The tillage of orchards by the harrow is now practiced extensively, and nothing short of irrigation will so nearly meet the demands of trees for moisture, particularly upon the heavier soils.

The Acme harrow is a most excellent implement on soils which are comparatively free from stones and rubbish. The plow-like action of its blades serves to pulverize the surface soil, to spread the loose mulch evenly, and it leaves a most excellent seed bed.

The cutaway or disk harrows may be either beneficial or of absolute injury. If the disks are so set that they cover but a portion of the surface with the mulch, they leave a ridge exposed to the action of the wind and sun and the rate of evaporation is greatly increased. The disks should be set at such an angle that the whole surface shall be stirred or covered. Their chief value lies in their cutting and pulverizing action on clay soils, but as conservers of moisture they are inferior to the Acme or the spring tooth. Soils which need the disk harrow should generally be gone over again with some shallower tool.

The mellower the soil the lighter should be the work done by the harrow. On most heavy orchard soils it will be found necessary to use the heavy tools, like the spring-tooth and disk harrows, in the spring, but if the land is properly handled it should be in such condition as to allow the use of a spike-tooth or smoothing harrow during summer. * * *

Cultivators and conservation of moisture.—The action of cultivators is not materially different from that of the spring-tooth harrow. The size of the teeth should be regulated by the work to be performed, a many-small-toothed implement being preferable to a few large teeth where the object is to conserve moisture. It must be borne in mind that in a dry time the less surface exposed the less will be the evaporation. * * *

The roller in its relation to soil moisture is an implement whose value depends largely upon local conditions. There is no tool which requires more judgment as to its proper use. On light, loose, sandy, or gravelly soils, where every effort must be made to solidify and pack the particles closely together, the roller must be used repeatedly. The difficulty of such soils is that the space between the grains are so large that the water is permitted to pass through freely and is lost by percolation. The capillary openings are so large, that there is very feeble rise of the water to take the place of that used by plants and lost by evaporation. The roller lessens the size of these pores in solidifying the soil, and the capillary force is then strong enough to draw the water to the surface (fig. 3). If, now, the soil is left in this condition, it has been put in the best possible form for parting with its moisture, and it will take advantage of the opportunity, unless prevented by establishing a surface mulch. In seeding land in a dry time the soil should be rolled, in order to bring sufficient moisture to the seeds to insure germination. Where circumstances will permit, the roller should be followed by a smoothing harrow, that the surface mulch may be restored and the moisture stopped before reaching the atmosphere (fig. 4). On clay lands the roller must be used with much caution. If used immediately after grain is sown and a heavy rain following, there would be danger of the soil becoming so compact on the surface that the tender shoots would be unable to get through, and the most direct connection would be established between the soil moisture and the air. A good method of treatment for clay is to roll before the seed is sown, then harrow and make a good seed bed, and then drill in the grain. After the plants are well up the roller may

Fig. 3.—Showing the effect of the roller in compacting the surface layer.

Digitized by Google

be used again, which will bring the water to the surface where the growing plants can make use of it before it passes off by evaporation.

Herbage mulches.—The covering of the soil by a mulch of leaves or decaying vegetable matter is nature's way of conserving moisture and of restoring fertility to the soil. Go to any forest where the leaves have not been burned annually and notice the mulch which covers the soil (fig. 5). The soil will be found to be moist and loose. Humus has been stored up and the covering of leaves prevents the escape of the moisture by surface evaporation. Many persons conclude that because nature tills by mulching man should do the same, but the conclusion is fallacious. Farm areas are too open and too much exposed to searching winds to allow of the good results which nature obtains in the seclusion and coolness of the forest. Even our largest orchards do not give us forest conditions. This herbage mulch also induces shallow rooting of trees, as sod land does. In most farm lands also it is necessary to plow or move the land at least once a year in order to sow the seed and harvest the crop, and this would destroy an herbage mulch. Aside from all this, it is impossible, except in very special cases, to secure sufficient herbage to afford an adequate mulch.

Fig. 4.—Showing how the soil mulch should be restored by tillage after the roller has been used.

The humus of the soil is the great storehouse for nitrogen and moisture. It is the accumulation of decaying vegetable or animal matter, and its presence in the soil, while not absolutely necessary to the growth of plants, is the factor which makes the land congenial for the very best development of the crop. The constant use of commercial fertilizers without being supplemented by barn manures or green manuring will so reduce the percentage of humus in the soil that its water-holding capacity will be considerably diminished. This humus should be liberally supplied by means of cover crops, rotations, and stable manures.

Underdrainage and how it acts as a conserver of moisture is popularly misunderstood. It is usually supposed that underdrains instead of acting as conservers of moisture, produce exactly the opposite effect. It has already been noticed that water may exist in the soil as free or capillary, and that the presence of the free water within 18 inches of the surface is positively detrimental to the growth of most cultivated plants. Not only is it necessary that moisture be supplied, but also that the soil shall be in such condition that the air may have access to it, for a supply of oxygen as is necessary to the breaking down and decomposition of organic matter and the making of plant food available. The underdrain removes only the free water which may come too near the surface and it leaves the soil above in a porous condition, so that the water of rainfall may sink down instead of being carried off by surface drainage. This rainfall water is not caught and removed by the drains in its downward course, but the drainage flow begins only when, by the accumulation of the rainfall, the level of the free water has been brought up to the level of the drain. Thus the reservoir for the supply of capillary water is kept nearer the surface during a drought and is removed a proper distance from the surface during a wet time to insure a healthy and proper development of the roots of plants.

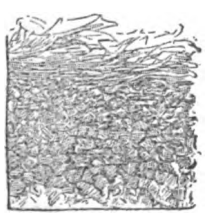

Fig. 5.—The loose mulch on forest soils.

Mineral substances as conservers of moisture.—Among the materials of commerce which are applied to soils as indirect fertilizers are lime, gypsum, and salt, all of which are thought to act as conservers of soil moisture. The application of quicklime to certain soils has been found to have a most beneficial action. When

Digitized by Google

used upon heavy clay, it causes a certain adhesion or flocculation, a binding together of the minute particles, and prevents their running at times of rains into a compact hard crust (fig. 6). It causes a more granular condition, making the soil looser and more porous, allowing the water of rainfall to permeate it more readily. As a result of the flocculation, the pores of the soil near the surface are enlarged, and it thus better serves the purpose of a mulch to hold in reserve the moisture underneath.

FIG. 6.—The flocculation of the surface of clay soils by the addition of quicklime.

On sandy soils, the difficulty in conserving moisture arises from the fact that they are so open and porous that the water passes through and is lost to the plant. It would seem that an application of lime here would tend to aggravate the difficulty. On clay, the action of the lime takes place at or near the surface, the soil being so compact that it is not washed down through the soil. In sand, the pores are so large that the lime sinks readily into the soil, and instead of finding the effects of its application at the surface we must look for it below. The binding property of lime is well known from its use in the trades. In its passage down through the particles of sand it does not proceed far before it probably begins to bind the grains together, and there is formed a layer somewhat impervious to water (fig. 7).

Frequent and small applications of lime have been found most beneficial. From 20 to 40 bushels per acre will usually be found to give the best results. On marshy and boggy lands which have recently been drained but still remain sour and full of undecomposed organic matter, the benefit derived from applying lime is very great. It breaks down the vegetable matter, neutralizes the acid, and makes plant food available. In this case its action upon the plant food in the soil is more important than its agency in the conservation of moisture.

FIG. 7.—The action of lime at a few inches in depth, in sandy soils.

Windbreaks to save moisture.—The drying effects of the wind are well known when it has unbroken sweep over a farm. The loss of moisture from this cause is very great. Windbreaks are not only protection in winter but they serve equally well in summer to protect the fields. The hedgerow around a field is not, then, entirely useless, since it serves its purpose as a conserver of moisture. * * *

SUGGESTIONS FOR DETERMINING THE AMOUNT OF MOISTURE IN SOILS.

It is a very easy matter to determine the amount of moisture in a soil. The only apparatus required is a pair of scales which will weigh to grains and a tube which can be driven into the soil for taking the sample. Such a pair of scales can be purchased for a small sum, and the tube may consist simply of a piece of boiler pipe about 1½ inches in diameter which has had the outer edge at one end beveled down to enable it better to be driven into the soil. Have a mark on the outside of the tube indicating 8 inches or 1 foot from the sharpened end, according to the depth to which it is desired to take the sample.

The sampler used by the United States Department of Agriculture (figs. 8 and 9) is described as follows: "The soil-sampling tubes are made out of brazed brass tubing about seven-eighths inch internal diameter and 15 inches long. The tubing is No. 21 Stubb's gauge. On one end a brass collar about one-fourth of an inch wide is sweated in. The end of the tube is then turned off in a lathe, giving a rather long taper, but letting the point be the full thickness of the collar. A mark

Digitized by Google

is cut into the tube 12 inches from this cutting edge." We have used this implement with much satisfaction.

In determining the moisture in a given soil, several samples should be taken and these samples thoroughly mixed and then accurately weighed. Then subject the sample to a heat of 212° F. for a few hours, then weigh and heat again for

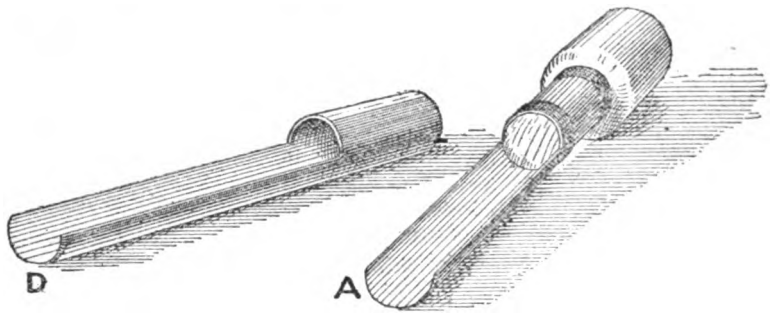

FIG. 8.—The soil sampler.

one hour, then weigh again, and continue this operation until there is no further loss of weight by heating. The difference in weight between the original and the heated sample will indicate the amount of moisture which was present. Divide the difference in the weight by the first weight of the sample to determine the per cent of moisture in the original sample and multiply by 100. The following case will illustrate:

Original weight of sample	pounds	2
Weight after drying	do	1.5
Loss in drying	do	.5

Per cent of moisture in original sample $=.5+2=.25$. $.25\times100=25$ per cent.

An interesting line of work for granges and farmers' clubs would be the investigation of soil moisture.

The importance of thorough culture to conserve moisture is so great that if its value was fully realized we should experience less trouble from droughts. Far better is a season with a deficiency of rainfall, if continuous surface culture be given, than a season of abundant rains with little culture. Much wiser is he who cultivates a small farm, and cultivates it intensively, than he who attempts to spread over a large area and allows his crops to suffer from droughts because the moisture which they so much need has not been saved by frequent tillage. Neglect the soil—allow the orchard to care for itself—and when the time of harvest comes the reward shall be according to the labor; but treat the soil as a living thing, care for it faithfully and intelligently, study the plants and learn their ways and the conditions under which they thrive, and give them congenial surroundings, and they will respond with a readiness that will abundantly repay the best efforts in their behalf.

SUMMARY.

1. The average annual rainfall in New York is sufficient for the growth of profitable crops. Owing to its unequal distribution and to the loss of nearly one-half of it by surface drainage, crops usually suffer from droughts.

2. The first step toward conserving moisture is to put the soil in such a physical condition that it will be pervious to water or afford a reservoir for it.

3. Water exists in the soil as free, capillary, or hygroscopic. The free water within eighteen inches of the surface is injurious to the growth of cultivated

Digitized by Google

plants. The capillary water is the direct source of their supply and should be conserved by all possible means.

4. Capillary action of the soil depends upon the fineness of its particles and the closeness of their relation to each other. In course, loose, sandy, or gravelly soils the action is weak; in fine, well-compacted soils it is strong.

5. When the capillary interstices or pores in the soil are continuous from the moist undersoil to the surface, the moisture rises uniformly and passes off into the atmosphere by evaporation. If, however, these interstices or pores are made very much larger near the surface, the moisture is arrested in its upward movement a result which is accomplished by light surface cultivation, which produces a "soil mulch." This mulch of loose soil answers much the same purpose as a board or carpet would in cutting off the direct connection of the capillary soil with the atmosphere. As soon as the soil becomes baked or encrusted the capillary connection with the atmosphere is renewed and another tillage is required to reestablish the soil mulch.

FIG. 9.—The soil sampler.

6. A large amount of water is necessary for the plant, as its food is in a very dilute solution, and water is also used in building plant tissue.

7. Moisture in the soil is necessary that nitrification and decomposition of organic matter may take place. Without it the action by which the roots are able to corrode the solid rock and set free plant food can not take place.

8. The distribution of rainfall can not be controlled by any known means. Dependence must be placed upon irrigation and the conservation of soil moisture.

9. Irrigation is expensive, and, while entirely practicable in arid regions, yet in our section if flooding by irrigation should be followed by heavy rainfall the effect might be disastrous. Where irrigation is not a common necessity it must be secured by individual enterprise and is therefore expensive. In New York we must depend largely upon conserving or preventing the loss of the moisture.

10. The means by which moisture may be conserved are: Judicious plowing and tillage, mulches, underdrainage, windbreaks, applications of lime, salt, etc., and adaptation of crop to the soil.

11. The absorbing or capillary power of a soil depends upon the fineness of division of its particles.

12. The plow is a most valuable implement for pulverizing and fining the soil. Fall plowing is recommended for heavy clays, the surface to be left rough and unharrowed. Fall plowed lands catch and hold the water.

13. Surface tillage should begin early in the spring as every day's delay after the soil is in fit condition means a loss of many tons of water.

14. The harrow is valuable as an implement with which to establish and maintain a surface mulch. Frequent harrowing of an orchard will greatly lessen the evaporation from the surface.

15. Where cultivators are used as conservers of moisture many fine teeth are preferable to a few coarse teeth.

16. Ridge culture is calculated to promote evaporation. To conserve moisture, practice level culture and so reduce the area exposed.

17. The roller brings moisture to the surface by compressing the soil. On loose sandy soils it is useful by compacting the particles. On clay its use may prove injurious if followed by heavy rains. Where possible it is well to follow it with a smoothing harrow to restore the mulch.

Digitized by Google

18. A surface mulch of leaves and decaying vegetable matter is nature's way of conserving moisture. It also adds humus to the soil, which is the great store house for nitrogen and moisture. An herbage mulch can rarely be used in farm areas, however.

19. Underdrains act beneficially in making soils porous above them and thus increasing their permeability; and in removing the free water and thus allowing the access of air, which is as necessary as moisture.

20. Lime, gypsum, and salt are all used as conservers of moisture. An application of lime seems to have a beneficial effect on heavy clay and on light sand. It also acts favorably on marshy, sour lands.

21. Grasses and grains should be grown on clay and loamy soils, leaving sandy and gravelly lands for cultivated crops. The humus of tilled lands may be kept up by barn manures and by green manuring.

22. The space between the trees in orchards should be left free for tillage. A growing crop makes such a demand upon the supply of moisture that the trees may be seriously injured.

23. Determinations of soil moisture may be easily made by anyone. The importance of this line of work is called to the attention of granges, farmers' clubs, and horticultural societies.

24. The importance of thorough tillage to conserve moisture can not be made too emphatic. Deficiency in rainfall with intensified agriculture is preferable to abundant rains and neglect by the cultivator. The soil will respond in a large measure according to the treatment it receives. Neglect it and it will fail to bring forth liberal increase, but cultivate intelligently and thoroughly and it responds quickly.

PROGRESS OF EXTENSION WORK—REPORT OF WORK DONE UNDER THE NIXON LAW OF 1897 OF THE LAWS OF THE STATE OF NEW YORK, CHAPTER 128.[1]

EDUCATIONAL WORK.

It was decided at the first meeting of the faculty of agriculture to emphasize the educational work, since the Federal experiment station, a department of the College of Agriculture, was able to carry on many investigations, especially those which of necessity must extend through considerable periods of time and which require ample and permanent laboratories, equipment, and investigators, while most of the work contemplated under chapter 128 could best be carried on away from the college.

The problem of how to successfully introduce into the schools of the State a study of the fundamental principles which govern the soil, the plant, and the animal, or the study of agriculture, has been considered most carefully by many distinguished educators. This subject was long and carefully considered by the faculty of agriculture before entering upon the work. The leaflets on Nature Study which were already issued had been so kindly received and so fully appreciated that it was decided to issue others and to employ trained teachers to visit the schools and to attend teachers' institutes for the purpose of explaining how the subject-matter of the leaflets, as well as other similar subjects, might be used as texts by the teacher, while the illustrations could not help but be useful to the teachers of classes in drawing. It was hoped, too, that after the teacher had given instruction on some subject intimately connected with natural objects which attract the attention of the pupil, the object having been used for a drawing in the class room, the description of such object would form a most interesting sub-

[1] Fourth report, February, 1898.

Digitized by Google

ject for compositions, which are now required in most departments of the public schools. By correlating with composition and drawing work, the objection of an added study was removed.

It is believed that a study of the more common and familiar objects of nature leads directly to a better understanding of those laws and phenomena which are the very foundation of improved agriculture. In the hands of the skillful teacher the leaflets may be used to impart valuable lessons in nature history and in the conservation of energy as applied to rural affairs, and may, in some cases, serve to interest teacher and pupil in the economics of agriculture. Briefly stated, it is hoped that such instruction will lead logically and naturally to a greater love for rural affairs and a more rational understanding of them among the old and young both in city and in country.

Eight leaflets in all have been published, electrotyped, and republished on the following subjects:

No. 1. How a Squash Plant Gets Out of the Seed. (Four editions.)
No. 2. How a Candle Burns. (Three editions.)
No. 3. Four Apple Twigs. (Five editions.)
No. 4. A Children's Garden. (Six editions.)
No. 5. Some Tent-Makers. (Four editions.)
No. 6. What is Nature-Study. (Four editions.)
No. 7. Hints on Making Collections of Insects. (Two editions.)
No. 8. The Leaves and Acorns of Our Common Oaks. (Two editions.)

The demand for these leaflets is so great that other editions will be required in the near future. The work in Nature-Study has passed the experimental stage; the demand for it is far beyond our facilities for carrying it forward.

This educational work in agriculture divides itself naturally into six divisions: Nature-study; schools of agriculture and horticulture; dairy instruction; lectures on special subjects, such as the sugar-beet industry; a course of reading and instruction for farmers; publications.

There are many principles of agriculture which are well understood by the scientist but which are not familiar to the farmer. It is proposed to secure the cooperation of progressive agriculturists in the endeavor to learn how best to fit these principles into practice.

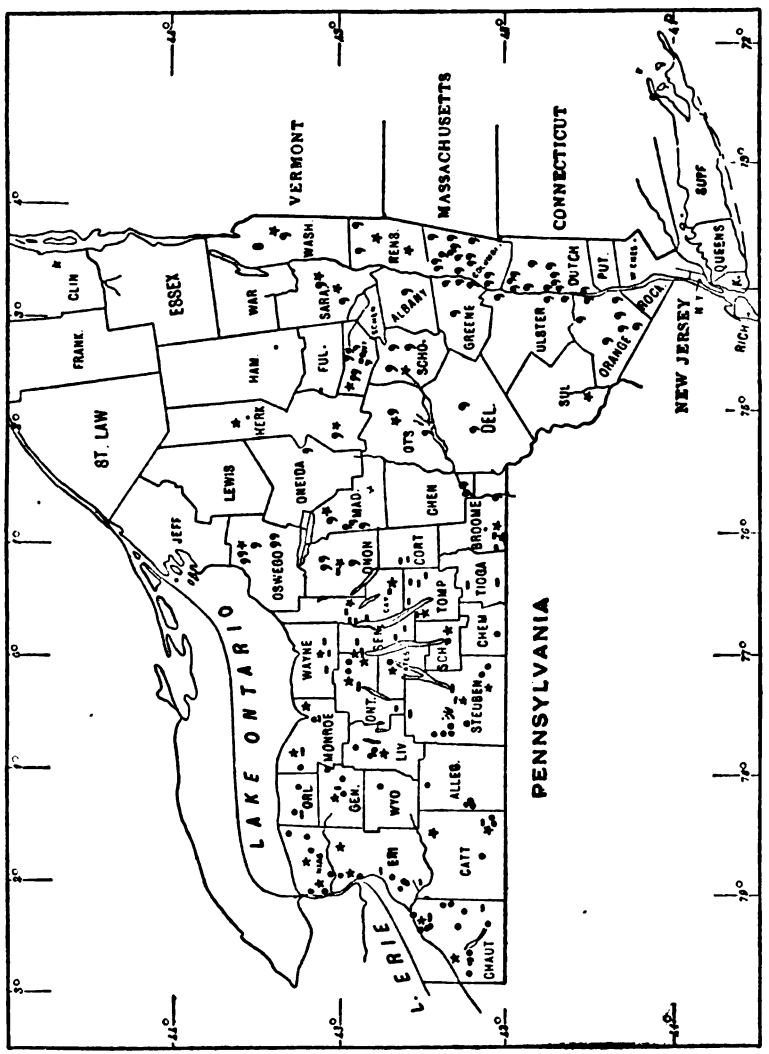
It is impossible to sharply separate these various activities, as one often overlaps the other. Suffice it to say, that more than seven hundred lessons and lectures have been given throughout the State by persons selected on account of their special fitness for the work in hand.

Thirty thousand teachers are enrolled on our lists and have received leaflets, and many have attended the lectures explaining the methods of presenting nature-study work in the schools. Sixteen thousand school children have received those leaflets which are especially adapted to their needs. Two thousand five hundred young farmers are enrolled in the agricultural reading course. These are assisted from time to time by means of printed circulars which give directions and assistance to the farmer in carrying on his studies at home. From time to time question papers are sent out for the purpose of giving opportunity to the farmer to make known his needs that they may be more fully understood and met. The location of nature-study centers is shown in the diagram.

It is believed that the benefits derived from carrying the experimental work beyond the limits of the station grounds are very great. First, the data obtained are valuable. In some cases they are much more valuable than could possibly be obtained from experiments conducted at the station. In corroboration of this statement, reference is made to the bulletin on sugar beets, already mentioned. Second, the station is brought into closer touch with the farmers. Meeting them on their own farms, the station workers become better acquainted with their

Digitized by Google

peculiar surroundings and needs, and can offer more appropriate assistance than they otherwise could do. On the other hand, the farmers learn better how the station can help them and how to avail themselves of that help. Third, the experiments serve as object lessons to the farmers. As such they impress themselves upon a large class of farmers that would give little heed to a printed description of experiments conducted at the station. Fourth, the experiments have a high educational value for the farmers performing them. Perhaps, at the present



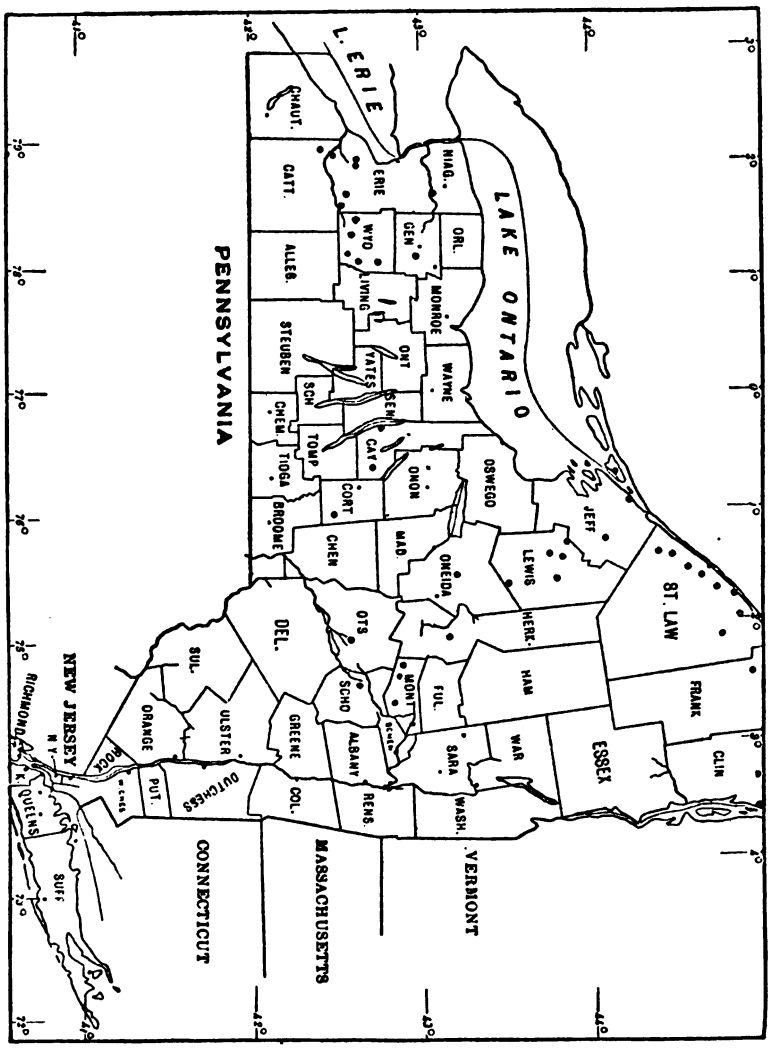
Showing where meetings have been held and schools visited in the advancement of nature study work.

time, this is the most important consideration. There are many questions affected by soil and climate that must be decided for each locality individually, and the greatest hindrance is the want of trained experimenters to take up the work. It is hoped and believed that we shall find in various localities in the State intelligent and public-spirited farmers who, for the benefits to be derived by themselves and their fellows, will be willing to cooperate with the station in this work.

The educational work which had already been done prior to April, 1897, by

Digitized by Google

Prof. L. H. Bailey, and his associates in horticulture in the western part of the State, made it possible to secure the cooperation of more than 300 farmers in the investigations in sugar-beet culture and 203 farmers in the experiment with fertilizers. The time has come when the help of the farmers must be secured if valuable investigations are to be conducted which shall be applicable to varied conditions. Climate, soil, environment, and needs are so varied in the State that



Showing points where dairy schools were held.

comparatively little help can be given unless the investigations can be conducted in the locality where the help is needed.

DAIRY HUSBANDRY.

Observations in the dairy districts led to the conclusion that this branch of agriculture needed assistance. The theory of making butter and cheese is fairly well understood, but the art, in many cases, was found to be lamentably wanting. To bridge over this gap between science and art, two expert dairymen were em-

Digitized by Google

ployed during the summer, men who not only knew much of the science, but of the art of dairy husbandry as well. These men went from factory to factory, called a few dairymen together, and gave valuable instruction by first teaching the leading principles and then by practically applying them.

INSTRUCTION IN AGRICULTURE IN THE RURAL SCHOOLS OF FRANCE.

THE FRENCH PROGRAMME.

The conception of making agriculture a subject of instruction in the public schools originated in 1791 in the second legislature of the First Republic—that is to say, during the period called in France "The Revolution."[1] The Second Republic, that of 1848, was unable, in spite of its "good intentions," to do more than the "Revolution" or First Republic had done; its laws were in practice only expressions of good will. During the seventh decade of the present century France experienced an "agriculture crisis" or depression, and in 1867 a great inquiry was made with a view to relieve the situation. Among the questions asked in this effort to obtain a consensus of opinions regarding the deplorable condition of agriculture, the most important national industry, was one which was expressed in these terms: Is the public school course (l'instruction primaire) conducted so as to favor agriculture, and what is its influence upon the choice of a profession? As may well be imagined, a great divergency of opinion is to be observed in turning over the 500 or 600 pages of extracts given by Mr. Inspector Pinet in the work which he so diligently compiled for the students of social science,[2] but Messrs. Prillieux and Schribaux, in an official report, summarize the inquiry thus:

The inquiry bore upon three main points: (1) What instruction [in agriculture] shall be given to male students in the elementary normal schools? (2) What instruction shall be given [in agriculture] in the district [communal] schools? (3) What instruction shall be given to adult persons in special courses which are appropriate to improve agriculture?

The same authorities give, "en résumé," the following conclusions as deducible from the replies.

1. Establish, as soon as convenient, a course of agriculture and of horticulture in all the normal schools for men.
2. In order to make the instruction given in these courses uniform (afin de constituer l'unité de ce professorat), let the agricultural colleges be given the mission officially to train teachers for the normal schools, unless it happens that agricultural instruction has been already regularly organized in that section. These teachers should be selected from among the best students of the third year of our normal schools and sent to a school of agriculture, whence, after two or three years, they are to be drawn out to be especially charged as assistants in normal schools, both with instruction in agriculture and, in part, in the ordinary subjects pursued in those schools.
3. Distinguish between rural schools and other elementary schools, so that the usual rural school instruction in summer will permit some agricultural work (s'accorder avec les travaux des champs).[3]
4. Put the matter to be taught in pedagogic form (une instruction détaillée), so as to point out precisely the way (préciser la voie) which the teacher in the rural schools ought to follow hereafter, in teaching agriculture and horticulture, and

---

[2] L'enseignement primaire en présence de l'enquête agricole, par A. Pinet, inspecteur de l'enseignement primaire, etc.

[3] It would appear that this means that the school hours should be so fixed in summer that the children might be able to work at home on the farm, "so that the children may be exercised in the duties of agriculture or be employed at labor in the great industrial establishments [factories], where their activity and their bodily strength may be developed." See Bulletin administratif du ministère de l'instruction publique, No. 164, 1867.

Digitized by Google

further, announce that, after two or three years, questions upon agriculture and the practice of horticulture will be an obligatory part of the examination for obtaining a teacher's certificate.

5. Class the districts (communes) of each county (literally "department") according to the kinds of crops (cultures) which dominate in each, and select, or have written if necessary, for each of these kinds of culture text-books which shall not only be easily understood (clair), but interesting, and, in addition, recommend that these books be adopted in preference to any others, and that all copy-book models, transcribing and dictations, as well as arithmetical problems, have an agricultural application. Finally, send the teachers out into the country, that they may know it understandingly.

6. Compare, by a rigid examination, the different elementary manuals upon agricultural instruction and agricultural reading books and adopt the best, subject to such additions, eliminations, etc., as may be thought necessary. If no book has yet appeared sufficiently good for the purpose, let a prize be offered for one or more of the kind required.

7. Require that a garden or a plat of land (terrain) be annexed to every normal school and every rural elementary school, in order that the teacher may set the elder pupils of the school to experimenting (essayer) with fertilizers, sowing, cultivating (binage, pulverizing the soil), but especially with trimming trees, and choose horticultural operations which have been brought to their attention in their books or written exercises. Further, let the teacher at least once a week take his pupils on an agricultural investigation (promenade), and, finally, place the normal school near a farm, which may or may not belong to the department, but in any case shall afford the students the best examples possible for their imitation.

8. Order that there shall be immediately established in each chief place of the canton or in a central commune agricultural and horticultural conferences, upon which all the teachers of the circumscription must attend. These conferences are to be presided over, both as president and professor, by a man well instructed in agricultural science, and also capable of imparting his knowledge to others. Any cultivator who requests permission may also be admitted to this conference.

9. Recommend to teachers to bring together during the winter evenings, if only once or twice a week, the grown-up people of their communes and give agricultural readings before them, accompanied with explanations and suggestions.

10. Fix upon a general programme or scheme which will serve as a general plan of campaign, to be completed by the particular programme proposed by the agricultural society—as the variety of culture in the different parts of France requires—and supplement it with the detailed instructions upon the methods which the teacher ought to employ, as noted in paragraph 4. Also, let there be sent out at the same time a list of practical exercises, etc.

11. Appoint in each department certain commissions whose members belong to the agricultural society or societies of that department, and, adding to this membership the inspector of schools, let them ascertain the results of the instruction and advise the teachers.

12. Finally, establish annual competitions between the students of the elementary schools and those pupils in the adult classes who are worthy to be admitted, and give each teacher an honorarium, gauged according to the number of prizes obtained by his pupils, the prizes to be awarded by the agricultural committees.

Such is the fundamental plan upon which the Third Republic of France has endeavored to introduce agricultural instruction into rural France, for the Second Empire collapsed in 1870, before an opportunity was given to it to carry out the ideas regarding agricultural education which it had in its last years found itself compelled to solicit. The essential problem of the plan is, the introduction of agricultural instruction having been decided on, to find the pedagogic form in which such instruction shall be given, pedagogic form in each of its features—what shall be taught, or programme; how shall it be taught, or method. The first of these falls within the province of the agricultural scientist; the second within that of the pedagogue, especially of that class whose business it is to systematize or, as the original of the above translation expresses the matter, "to constitute the unity of the professorate," or, in English idiom, teach the same thing in the same way everywhere, though apparently teaching local agriculture, a programme, indeed, expedited and enhanced by the intelligent teacher, though held stationary and perhaps deteriorated by mere routine. Let us see how these features of pedagogical form have been handled in France, first confining attention to the form

Digitized by Google

rather than to the agencies fixed upon as proper to introduce a rational agricultural instruction in the public elementary schools.

1. PEDAGOGIC FORM, OR THE PROGRAMME AND METHODS.

We now for a time take leave of Mr. Inspector-General of Agricultural Instruction Prillieux and Professor Schribaux, who, unquestionably, are far better able to speak upon this subject than a foreigner, and go back to the 31st day of December, 1867, when Mr. Victor Duruy, now so well known abroad as an historian and in France as one of the great ministers of public instruction, was at the head of French school affairs. On the 29th of December, 1867, Mr. Duruy had ordered that the departmental educational authority should arrange the school hours in summer so that a portion of the children's time might be utilized at home, hoping thereby to prevent the withdrawal of them by parents during the summer time. On the following day, December 30, he issued a programme both for the elementary and the normal schools, and on the 31st he nominated several departmental professors of agriculture and fixed their duties, and at the same time issued an "instruction" upon the organization of agricultural teaching. But first, as to this "instruction," so far as its second and third divisions are concerned, quoting from Mr. Duruy's circular:

Mr. PRÉFET: I have already communicated to you the different measures proposed by the commission which was charged with the matter of organizing and developing agricultural instruction in the normal schools, the classes for adult persons, and the rural elementary schools, and I have submitted to the imperial council of public instruction such of its conclusions as I deemed it advisable to have its advice upon before stating them. I now pass in review the propositions of the commission, and notify you of the conclusions which have been arrived at in regard to them. * * *

(2) Fix upon a general programme of agricultural teaching which shall be appropriate to local conditions of culture. Upon this proposition of the commission it is to be said that one of the principal obstacles which presents itself to the introduction of agricultural instruction in our classes is the want of a definite programme. When we examine the very large number of works which treat upon agriculture, we see very quickly how, in this vast field of agricultural science, the makers of these volumes differ about the principles of the science which it is desirable to place before children and country boys for their study. The matters which are presented by one author as fundamental are scarcely noticed by another, and not at all by a third. This one insists on the cultivation of sugar-producing plants, that one upon mulberry trees, and still another upon the exclusive culture of this or that forage plant more or less unknown. One class are very special in their point of view and their works are of no value except under special conditions or in a certain locality; the other class take such a general view that in wishing to cover everything they are not at all practical.

On the other side, every teacher has not made agriculture a special study with the intent of teaching it, and the actual condition of things in the line of agricultural science offers little inducement for them to engage in a study the principles of which are not yet fixed, as far as it is a matter of instruction. By placing in their hands a body (un ensemble) of verified principles in the form of a programme they will very soon be in a position to make a course of instruction which will produce advantageous results.

How do the schools which are especially organized for technical instruction set to work? They commence by inscribing on their programmes the fundamental laws of the science they desire to teach; then, selecting from among its applications those which have a direct bearing upon the particular industry, they extend and develop them, and in this way young people are educated, who, by joining subsequent experience to the principles which they had been previously taught, become men who are useful to themselves and to society.[1]

Let us turn now to Mr. Duruy's official programme, which is prefaced as follows:

In view of the articles 5 and 35 of the law of March 15, 1850, and the decree of July 2, 1855, the imperial council of public instruction proceeds to determine:

ART. 1. The programme of agricultural instruction in the rural elementary schools and in the elementary normal schools shall be as follows:

(1) *Vegetation, soil, climate.*—A general view of vegetation, the duration of

[1] Bulletin administratif du ministère de l'instruction publique, 1867, No. 164, partie officielle.

Digitized by Google

vegetable life of vegetables, different methods of reproduction (seeds, buds, etc.). Soils, their nature and physical properties. Influence of climate and agricultural zones (régions agricoles).

(2) *Principal operations in agriculture.*—Fertilizing substances, tillage, écobuage (lifting and burning the turf filled with roots, etc.). Instruments of cultivation. Drainage and irrigation and watering. Sowing and transplanting. Harvesting and preservation of crops. Influence of heat and light. Breaking up pasture, etc. Inclosures, country roads, wagons, and buildings.

(3) *Crops and vegetables of interest to France.*—Cereals, beans, oil, fabric and color producing plants, forage plants, pasture, curing. Roots to be used as food or in industrial processes (sugar, alcohol). Parasitic plants and animals. Bushes (végétaux ligneux). Propagation, seed beds, grafting, etc. Fruit trees, elementary forestry.

(4) *Domestic animals useful to agriculture.*—General principles. Cow, horse, pig, etc. Fowls, silkworms, bees.

(5) *Agricultural economy.*—Capital, renting, working on shares, proprietorship, buying and locating a farm (domaine). Rotation of crops. Influence of various circumstances upon agricultural systems. Starting out. Bookkeeping.

(6) *Horticulture (culture des jardins).*—Division of horticulture in three parts, viz, fruit garden, vegetable garden, flower garden. Parasites of garden crops.

In 1880 the plan of campaign is somewhat changed. The syllabus of instruction in the normal schools is changed to read very like the matter given on page 1010 of the Report of the Commissioner of Education for 1889–90, under the head of "Introduction" to an agricultural course in higher elementary schools for boys, and to this the reader is referred. In 1882 instruction in agriculture was made obligatory in the rural elementary schools of France, and in 1895 a new programme, more specifically chemical and agricultural, was issued. This plan appears as a part of Chapter XXIV of the Commissioner's Report for the year 1895–96, to which the reader is referred.

The programme of 1887 is as follows:

ELEMENTARY PRIMARY.

Elementary course (7–9 years). First lessons in the garden and school.

Middle course (9–11). Ideas appropriate to what the child has read, object lessons and excursions with the purpose of familiarizing pupil with soils, fertilizers, tillage, and common implements.

Higher course (11–13). More methodical instruction upon tillage, implements, drainage, fertilizers of all kinds, sowing, harvesting, domestic animals, and bookkeeping. Ideas about horticulture, propagation, tree culture, and grafting.

SUPERIOR PRIMARY.

Complementary course (boys and girls over 13). Same programme as for following, but less developed.

Higher primary schools (for boys and girls). Practical ideas about vegetation, and the duration of growth, and reproduction (seeds, buds, grafts). Different kinds of land, manures, and their use and rotation. Experience with and use of agricultural implements and machines. Principal operations in agriculture, such as breaking up land, planting, transplanting, drainage, and irrigation. Principal crops of France and of the locality. Diseases of plants; parasites. Legumes, fruits, flowers; use of sash. Training and pruning fruit trees; care of domestic animals; bee culture.

II.—School Gardens.

[Instructions of Jules Simon, minister of public instruction of France, dated February 25, 1872.]

Land designated for school gardens sometimes requires money for breaking up, manuring, and planting, which comes most frequently out of the pocket of the teacher, who is not always prepared to meet such expenses. In consequence these gardens either are not cultivated as they should be, or the fruit trees are not of the best kinds. In addition, the teacher who owns these trees takes them away with him when he is appointed to another position. This is, of course, proper, but the gardens are thus periodically depleted of trees, and the instruction in fruit-tree culture is either interrupted or relinquished entirely in the schools to which the depleted garden is annexed.[1]

[1] The climate of Europe permits fruit trees to be cultivated on stocks, which, while dwarfing their growth, permits them to be annually both severely pruned, in the sense of that word in America, and also root pruned; hence they are readily removable.

Digitized by Google

It is desirable to remove these obstacles, and to accomplish an improvement it is essential to include in the appropriation for the school buildings and grounds the cost of preparing the soil for gardening purposes, and under such conditions the trees owned by the district shall be inventoried as fixtures, and the teacher, who necessarily gathers the fruit, shall do so by virtue of his position alone. It is only in this manner that it is possible to create, to maintain, and to develop an instruction which tends to increase the well-being of the rural population.

I desire to add, in order to facilitate the organization of this kind of instruction in the rural public schools, that it is necessary to limit expenditures as much as possible, and this may be brought about, I am led to believe, through the normal schools which have nurseries from which scions and cuttings, as also new or useful plants, may be furnished each year; and I am convinced that the directors of these normal schools will second the effort of the minister in this matter.[1]

III.—The Departmental Agricultural Professor and His Course in the Normal Schools for Men.

The National Legislature of France in 1879 created a "departmental professor of agriculture," whose duties embraced the following:

1. The agricultural instruction given in the normal schools of each department and in other public schools where such instruction may be given.

2. Country meetings ("farmers' institutes"), not fewer than 26 annually.

3. Such duties as he may be charged with by the prefect of the department or the minister of agriculture and commerce.

By the law of March 28, 1882, elementary agricultural instruction in the public schools was made to comprehend the elements of the sciences and their application to agriculture, and by the decree of 1887 it was made to comprehend the first ideas about science, principally in its applications to agriculture.

Programme of the course of agriculture for French normal schools for men.

Second year of normal-school course, devoted to agriculture, zootechnic, and rural economy (two hours a week): (1) Vegetable growing—study of the soil and the means of modifying its chemical composition and physical properties (manure and fertilization, irrigation, drainage, cultivation: special crops, such as cereals, legumins, etc.), and rotation of crops; (2) zootechnic—feeding places of horses, cows, sheep, and swine; and (3) rural economy—property in land, methods of exploitation and capital required, bookkeeping.

The third year of normal-school course, devoted to horticulture (fruit-tree and vegetable growing) (one hour a week): General ideas of culture planting, preparing the soil, the "plantation;" special kinds of culture of fruit trees, grape, peach, cherry, plum, pear, apple, roses, etc.; grafting; and the vegetable garden. The professor must accentuate the methods and productions of the different localities. (Subsequently this programme was changed so as to make the course consist of two lessons a week during winter to the second-year students in one class.)

In his special instructions the minister of education of France observes that it is not to be understood that the normal schools are to be turned into "agronomic institutions" because agricultural instruction is given an "honorable place" in their course of study. "What is necessary," said that functionary, "is that the graduates when they become teachers shall carry to the elementary schools an exact knowledge of the soil, the means of improving it, the methods of cultivation, the management of a farm, of a garden, etc. It is sufficient if they can teach in the elementary school the elements of agriculture, give wise counsel in the neighborhood, and, if necessary, combat effectively routine and prejudice. To accomplish this it will suffice if the instruction given by the teacher is sober and clear; if the ideas of the students are rectified by visits to the best farms, by some laboratory work, and by frequent tests in the garden or demonstration field of the school. The object of the course is not to teach the business of farming, but to study the phenomena of life and the conditions of its development, to inspire a love for the country, and to develop the natural tendencies of children to become interested in flowers, birds," etc. (Decree of 1880.)

[1] In America the experiment station might serve instead of the normal school, though it should be stated that there are about 100 normal schools in France.

Digitized by Google

IV.—The Demonstration Grounds (Champs de Démonstration).

The departmental professor should not confine himself [said the French minister of public instruction in 1881] to giving merely oral instruction. He should join example to precept, operate upon the place, reenforce his lessons by demonstrations with machines or instruments, and conduct his pupils abroad to witness the results obtained by advanced methods. I have unceasingly called these facts to the attention of departmental professors each time I have had occasion to inform them of a new fact or discovery or of legislative matters necessary for the rural population to be made acquainted with, and my efforts have already borne fruit. Several professors, recognizing the utility of these suggestions, have created experimental stations (champs), have published interesting reports, and organized practical demonstrations which have been appreciated by the public; but though these examples have been imitated outside of our borders, they are still too infrequently copied at home. * * * There should be no confusion between these demonstration grounds (champs de démonstration) and experimental stations—that is, establishments of experimentation (champs d'expériences ou établissements d'expérimentation). The experimental station is designed to make experiments to test doubtful or misunderstood matters, and such is the function of the agronomic stations of France; but the methods of investigation carried on at such stations require an expenditure of time in the field and laboratory not at the disposal of the departmental professor to give. The demonstration grounds are to show the facts which have been discovered and verified; in short, to disseminate the character and value of such discoveries. (There were said to be, in 1896, nearly 4,000 of these plats.)

V.—Cause of the Failure to Accomplish the Best Results in Agricultural Instruction in France.

The teachers [say Messrs. Prillieux and Schribaux, in their official report published by the minister of public instruction, 1890] carry away to the elementary school the methods and tendencies of their normal school. If agriculture does not occupy a place of honor in that school, if the general instruction does not testify for agriculture a sympathetic feeling, it is absolutely necessary to renounce all hope of making our teachers the apostles of progress in agriculture, and it would be wise to remove from our programmes for the rural elementary schools a branch of instruction which is taught without knowledge, without conviction, and without benefit. So far, at least, agricultural instruction in the French elementary schools has given mediocre results.

As early as 1884 the departmental professors as a body addressed the minister of public instruction, who had inaugurated an inquiry, to the following effect.

We deem it proper that the examination for a teacher's certificate should recognize more largely the instruction given by the departmental professors. More than 65 departments have now (1884) a chair of agriculture, and lessons in agriculture are given in almost all the normal schools for men, as far as the students of the second and third years are concerned. This instruction is given according to a general plan everywhere the same, which has been approved by the superior council of public instruction, and it seems right that candidates for the higher grade teachers' certificate should give a special guaranty that they are proficient in agriculture and horticulture.[1]

Though this deliverance has not been ignored, nevertheless it is said that the departmental professors are not satisfied with the situation.

VI.—The Farm or Practical Schools of France.

[From a report prepared by an English Parliamentary commission.]

The farm schools of France (1896) are a class of institutions which correspond more or less to the model farms of Ireland, and French experience in this particular has not been more fortunate than Irish. In 1848 these were a class of schools greatly favored by French theorists in agricultural education, and 52 of them were established in different parts of France. This number has been steadily diminished by the State until there are now only 16 of them. The farm schools

[1] Recueil des monographies pédagogiques publiées par le ministère de l'instruction publique.

Digitized by Google

were intended chiefly for the training of agricultural laborers, farm servants, and the sons of small farmers, but it has been found that the sort of knowledge there received is better acquired by service on well-managed private farms on which young laborers can earn from $50 to $75 a year while learning all they want to know.

There are in France 6,913,500 farmers, of whom 3,460,000 are proprietors and farmers, the other half being day laborers and servants. Out of the 3,460,000 proprietors and farmers 8,159 cultivate farms of more than 500 acres, 20,644 between 250 and 500 acres, 115,254 between 100 and 200 acres, 259,800 between 50 and 100 acres, and 3,022,700 less than 50 acres.

This last class contribute the backbone of the French peasantry, that wonderful race whose thrift, industry, probity, tenacity of purpose, and intelligence have excited universal admiration. This class shrank from sending their children to the farm schools, there to act as a sort of servant and simply to learn what they often could learn just as well at home. Thus it was found necessary to create a new type of school, one whose fees should not be above the means of the small farmer nor require for admission a higher preparation than was given by the elementary schools, and, further, which should receive the pupils not at the age of 17, like the farm schools, but at 12 or 14. The first school of this kind was founded in 1872 with the aid of the departmental council of the Department of the Meuse (i. e., in English, Meuse County). The General Government resolved to include them in the national system in 1875. There are now 40 of these schools. These "practical" schools are a most interesting combination of the State system with the voluntary system of Government, of Government aid with local and private initiative and support, and of central authority with local responsibility.

The practical school must be established on a farm or an estate belonging to an individual or a county council or a municipality, and must be carried on by one or other of these owners at their own expense and risk, the State supplying only the cost of the teaching and directing staff and some scholarships or bourses by way of assistance to less well-to-do pupils. The implements and other material must be provided by the locality. No encouragement is given to a large outlay on showy buildings, the existing buildings of the chateau or farm offered being almost invariably utilized. When a farm or estate has been selected by the minister of agriculture on the advice of the county council and after inspection by an agent, the proprietor or farmer is usually named director and given control of the school; and it is one of the most noteworthy results of the French system of agricultural education that in most of these cases the proprietor, a farmer, is a highly trained agriculturist possessing the diploma of the National Institute of Agronomy. [The university or post-graduate course of French agricultural instruction, see p. 998 of Report of this Bureau for 1889–90, vol. 2.] The staff usually numbers eight or nine. The director, who, if he be a professor, is paid $800 to $1,200, one professor at $480 to $600, one $400 to $480, one at $360 to $440, an assistant master and laboratory superintendent of garden work each at $320 to $400, a visiting veterinary officer at $120 to $160, and a military instructor $60 to $80. It is another result of a well-established system of agricultural education that a supply of fully qualified teachers is available to man these agricultural colleges and some of them decorated for services done to the science of agriculture. The aim is to train the pupils in the best forms of cultivation for their own part of the country, but the theoretical course is more uniform, including agriculture, zootechny, rural economy and engineering, physics, chemistry, botany, meteorology, zoology, geology, horticulture, entomology, a popular course in civil law, mathematics, surveying, bookkeeping, and hygiene.

INSTRUCTION IN AGRICULTURE IN PRUSSIA.

The royal department of agriculture of Prussia in 1897 submitted to the Prussian legislature a course of study in agriculture for rural public schools which had been in successful operation as the course in agriculture for the model schools (Musterschulen) of the circle of Rybnik in Prussia.

In the Pädagogische Zeitung, the organ of the German Teachers' Association, this course is described, the journal taking the occasion to speak of the poor pedagogical condition of the rural schools and to ask the question, "What can the agricultural minister of each State of the German Empire do to build up the agricultural continuation schools?" and to answer the question thus: "He should improve the course with strict regard to the requirements of the agricultural calling; should provide a course for the instruction of teachers of rural schools; should supply traveling technical teachers, compile reading books, provide apparatus, and distribute prizes." The curriculum of the model "continuation" schools now being established in Rybnik "Circle" in Prussia, continues the Zeitung, is to be taught by a traveling agricultural teacher and the regular teacher. The programme is as follows:

NATURAL SCIENCE AND AGRICULTURE.

One hour weekly.

First winter.—(1) Physics, to wit: The general properties of bodies and gravity; the sources of heat and its distribution; the thermometer; water, liquefaction, steam, ebullition, fog, dew, rain, ice, atmospheric heat phenomena. (2) Chemistry: The most important agricultural inorganic compounds; carbonic acid, sulphuric acid, phosphoric and silicic acids, nitrogen and the air, ammonia and nitric acid, hydrogen, water (in December). Potassium, sodium, magnesium, lime, alumina, iron and its most important combinations (January). (3) Soil formation (February). (4) Fertilizers (March). (5) Agricultural plants, to wit: Useful and objectionable plants; cultivated plants, meadow plants (pasture grasses?); weeds and their destruction; the value of a forest (die Bedeutung des Waldes) (November). Inner and outer form of plants; increasing by budding (Knospen) and seeds; conditions of germination and growth (December). Nourishment of plants (January). Irrigation and drainage (Be- und Ent-wässerung); rational preparation of the soil (February). Sowing, cultivation, and harvesting; the more important cultivated plants, including kitchen vegetables (March).

Second winter.—(1) Chemistry, the more important organic compounds, to wit: Starch, sugar, fat, albumen (November). Dairying, food, circulation of the blood, and respiration (January). (2) Physics: The lever, inclines, pulleys, specific weight, atmospheric pressure, barometer, pump, hose, siphon (February). The more important agricultural implements and mechanics (March). (3) Zoology and cattle raising, to wit: Useful and harmful animals, bony structure (November). The more important breeds of domestic animals; structure of the teeth (December). Breeding, habits, and care of animals (January). Feeding animals, especially young cattle. (4) Rural economy, to wit: Concurrence of land, capital, and work; relations of grain and forage farming; rotation of crops; mutual cooperative societies and insurance (March).

CHAPTER XXXIV.

CONSULAR REPORTS.

Contents: Gardeners' schools in Russia—School gardens in Russia—Educational institutions and methods in Corea—Leipsic Commercial University—Commercial education at Gera, Germany—Weaving schools in Germany—Education in Russia—School for merchant marine in Russia—Supplementary education in Saxony—German studies of malarial disease—Practice of professions in Japan.

GARDENERS' SCHOOLS IN RUSSIA.

In compliance with a request from a resident of Massachusetts the Department of State sent an instruction to various United States consular officers in Russia to forward information in regard to gardeners' schools in that Empire. Reports have been received from Odessa, Moscow, and Warsaw. These replies appeared in Advance Sheets of Consular Reports, and are here reproduced. They will serve to supplement an article on "School gardens," Vol. 1 of this Report, p. 224.

ODESSA.

United States Consul Heenan writes, on February 5, 1898:

In compliance with instructions from the Department I have the honor to transmit a report on school gardens and agricultural science in Russia. In this report I have given a brief history of the efforts made to improve the conditions of agriculture in Russia. It seemed advisable to do this, in order that the subject of school gardens should be better understood.

The system of farming in vogue among the peasantry in Russia is primitive in the extreme, the peasant believing that what was good enough for his grandfather is good enough for him. The difficulties and opposition which private and official efforts meet in Russia would scarcely be understood in the United States. It is quite safe to state that the soil which is tilled by the peasantry here, if it were tilled in a proper manner, would yield two and even three times as many bushels per acre as it does at present. How serious a competitor Russia would then be in the grain markets of the world will be easily understood, when it is remembered that its wheat crop alone in 1896 was 372,000,000 bushels; in 1895, 397,000,000 bushels; in 1894, 446,000,000 bushels; and in 1893, 402,000,000 bushels.

The historic part of this report was taken largely from Prof. N. P. Moskalske's article on agricultural schools in Russia, which was prepared for the Columbian Exposition at Chicago in 1893. The part relating to school gardens was obtained by correspondence with various parties and by visits and conversations with others.

I have confined this report to the school gardens in the government of Ekaterinoslav, because this province is a fair example of what has been done.

The first practical school of agriculture in Russia was founded in the government of St. Petersburg, late in the last century. It was the first attempt to develop the science of agriculture in Russia. Persons of both sexes and of all classes were admitted; the full course was three years. The attempt, however, was a failure and was abandoned in 1803.

Digitized by Google

In 1822 the Agricultural Society of Moscow, in connection with the Economic Society of St. Petersburg, established at Moscow an agricultural school with an adjoining farm, where, at first, only peasants belonging to landowners were admitted. Later on, in 1835, boys of all classes had free access to the school. The qualifications of entry were that all applicants should be able to read and write and should be not less than 16 years of age. The full course was for five years, and comprised the ordinary sciences, as also geodesy, chemistry, physics, mechanics, agriculture, architecture, and bookkeeping. The aim of the school was to qualify young men to manage estates.

In 1825 a similar school was founded in St. Petersburg by the Countess Strogonov, who gave it over to the Imperial Economic Society and permitted the students to make their practical studies on her estate of 1,200 acres, in the government of Novgorod, about 60 miles from St. Petersburg. Eventually the Russian Government contributed toward the support of this school; nevertheless, as it proved to be too great a financial burden for the Countess, and as it did not show very practical results, it was closed in 1844. The same fate awaited the two agricultural schools founded near St. Petersburg in the forties—that of Udelnoe, exclusively for peasant boys, and the St. Petersburg school, belonging to the Economic Society, exclusively for boys of the nobility. The peasant students soon left the school and returned to their old ways of farming, while the students of the other school, profiting by the rights given them by the school, entered the Government service. The committee for improving agriculture in Russia, which was founded in 1833, had great influence on the development of the science of agriculture in Russia. It was due to the influence of this organization that Government aid was secured for existing agricultural schools, and also for the establishment of new schools. In 1836 a new school was established in the town of Gorki, in the government of Mojilev, with teachers specially trained for their duties by the professor of rural economy and technology in the University of Jurjev.

The first establishment in Russia for teaching the science of gardening was founded in the Crimea in 1812 and was known as the Nikitsk Garden. The principal aim of this institution was the cultivation and acclimatization in the Crimea of the plants of southern countries. In 1828 the Magarachsk School of Viticulture was joined to the garden. Later on, two garden schools were opened, one in Penza and the other in Ekaterinoslav, and also the Imperial Botanical Garden in St. Petersburg. Of these, the Ekaterinoslav school was closed in 1859, while the others have remained in existence ever since.

The above brief summary gives the history of private effort in Russia to spread the science of agriculture. It is only since the reign of Nicholas I, when the ministry of Crown domains and agriculture was estbatished, that systematic measures for spreading the science of agriculture have been taken by the Russian Government. An agricultural school with an extensive special course, but with very limited instruction in other branches, was opened in the town of Gorki in 1840. It was divided into three sections—a lower, designed principally for peasants; a higher, called the Gorki Agricultural Institute, for furnishing educated agriculturists; and a middle, for preparing land stewards and farm bailiffs. Twenty thousand dollars was annually appropriated for the maintenance of the institution, together with the school and farm.

Young men who had finished their literary studies in a secondary school were admitted to this institution. The course was four years, during which time students were trained in natural and agricultural sciences and were given practical lessons in farming. Those who finished the full course in the institute had the same rights as those who graduated from the universities. In 1864 this institute

Digitized by Google

was transferred to St. Petersburg, and in 1869 the teaching of forestry received so much attention that the institute was divided into two sections—agriculture and forestry. In 1878 the first section was closed altogether, and the school was changed into a higher school of forestry. From the foundation of the Gorki Agricultural Institute to the year 1865, when it was transferred to St. Petersburg, 499 persons had completed the full course. If the 70 students who finished the higher section be included, the total would be 569.

The agricultural schools which were afterwards established in the various governments of Russia were chiefly molded on the Gorki Institute. For the lower instruction in agriculture the Government provided eight farms on Crown lands in the different divisions of Russia. These farms were designed for preparing young peasants to be expert farmers and for making experiments to improve the industry. Young men from 16 to 20 years of age, able to read and write, were admitted as pupils on these farms. The teaching was exclusively practical and consisted in working on the farms and in studying the best methods of agriculture. The course was for four years, and corresponded to that of the lower schools, adding thereto the fundamental rules of agriculture and of veterinary surgery by simple means. Schools of these three grades also existed in Russia for teaching gardening. In the fifteen years during which farms and nurseries existed for teaching boys, the number of pupils who had finished their full course was as follows: Up to 1865 there were on the farms 2,410 pupils, and in garden establishments, up to 1869, 849 pupils, of whom 518 were in garden schools and 331 in nurseries. These pupils, chiefly serfs, were of great use to their masters. The records show, however, that these schools made but little improvement in the peasants' method of farming, as most of the pupils on returning home continued to follow the old systems of farming. The principal reason why the teaching of these schools was not more effective was that the pupils were too little taught to study special branches. There was no elementary instruction in the natural sciences preparatory to the study of special subjects. The boys often attended these institutions not from choice, but under compulsion, and looked upon the whole course in the light of an unpleasant duty. This view was pretty general among the peasant farmers, and even among the landowners.

This brings us down to the reign of Alexander II and the liberation of the serfs in 1861, which freed the Crown peasants from the jurisdiction of the ministry of Crown domains, and resulted in a complete change in the system of developing agricultural industry in Russia. The Government soon discovered that the landowners, as well as the peasants who had been set free, were in great need of instruction in farming, and steps were taken to disseminate the science of agriculture among them. Without going too much into detail, it will suffice to state that the efforts made consisted in still further developing and increasing the number of schools. These schools were classified as higher agricultural schools, middle schools, farm schools, land-surveying schools, and garden schools.

It is not the intention in this report to do more than mention these schools and to add that they have been very successful. It is with the lower agricultural schools and the efforts to reach the peasant class that this report has to do. When the middle agricultural schools had attained a sufficient development, the ministry of Crown domains began to establish lower-grade schools. These were organized one by one, and during the ten years from 1871 to 1881 six were established. The first founded was a dairy school, opened in 1871, in the town of Edimonovo, on the River Volga. The school admitted pupils of both sexes, without any restriction as to age or qualifications. The number of pupils was over 80 per year. There was no theoretical course and no fixed plan for practical studies in the school.

Digitized by Google

The second lower school was the Goretsk Trade School, founded in 1872, for preparing workmen for making farming machines and implements. A factory and workshops were annexed to the school in which boys learned to make and mend farming implements and machinery, and for that purpose they were instructed in joinery, wood turning and polishing, locksmith's work, soldering, and smithy work in general. The full course at this school was five years. Besides the ordinary subjects, the following were taught: Physics and general mechanics, metal and wood technology, agricultural mechanics, the construction of agricultural machines and implements, tracing, and geometric and technical drawing. The average number of pupils attending this school was about 50 a year, and the number who finished the full course was, on the average, 4 persons a year. The school receives $2,000 annually from the Government.

To the category of agricultural schools established according to special regulations belongs the school in Courland, on the estate known as Alt-Saten; also the schools in the governments of Minsk, Kostroma, and Vladimir. As the organization and maintenance of these lower schools were very expensive, the number of pupils finishing the full course rather small, and the demand for expert farmers considerably increased, the ministry of Crown domains arrived at the following conclusions: That it was very important to increase the number of lower agricultural schools; that the cheapest and simplest method would be to establish them on well-organized estates, believing that theoretical teaching could be better combined with practice on such estates than on Crown lands. The law in connection with these lower schools, which was enacted in December, 1883, contains the following provisions:

(1) The aim of the lower agricultural schools is to spread among the population the fundamental principles of farming and of the trades connected therewith, principally by practical studies and work.

(2) The schools are to be founded by private persons, by zemstvos, or by societies on lands pertaining thereto, or granted by the Government for that purpose.

(3) The courses of these schools are divided into two grades, namely, a general, for the teaching of agriculture, and a special, for its different branches, such as apiculture, gardening, wine making, the dairy, etc.

(4) All the pupils are required to work gratis on the farm belonging to the school or to the founder of it, but after one year a small salary may be given them.

(5) The lower schools may be of two categories, first and second; but the course in both is the same, and of three years. One or two preparatory classes may be annexed to the school.

(6) Boys not younger than 14 may enter the schools of either category. Those who enter the first category must previously finish the course in a two-class village school. To the preparatory classes pupils of very limited education are admitted.

(7) Besides reviewing the general sciences, the pupils are to be taught natural sciences and given a short course in agriculture.

(8) In winter the pupils study in classes, and the summer is given to practical studies.

(9) After finishing the course, the pupils, before receiving diplomas, must practice for one year on other farms.

(10) The Government contributes from $750 to $1,800 a year to agricultural schools, according as they belong to the first or second category and to the number of preparatory classes. This sum is given only for the maintenance of the teachers and for books.

(11) In schools supported by the Government a smaller number of pupils are admitted. A special contract is concluded with the department of agriculture

Digitized by Google

and rural industry, in which are stated the rights and obligations of the founder of the school and of the proprietor of the estate on which it is opened.

(12) Those who serve in the schools are freed from military conscription and enjoy all rights attending the civil service, and at the end of each five years' service receive from the treasury an augmentation to the amount of a fourth of their annual salary, till such time as the originally determined salary shall have been doubled.

(13) Special regulations for dairy schools have been drawn up and perfected by the minister of imperial domains, in mutual agreement with the minister of public instruction. In the regulations for these schools the following points are noted, in distinction to the regulations of ordinary rural industrial schools:

Dairy schools may be established on all private estates where a regular dairy industry is carried on, where there are not less than 80 milch cows, and where each cow gives not less than 2,700 pounds of milk annually. The school may be either for boys or girls. The number of pupils in each school must not exceed 12. A treasury subvention is accorded, both for the salaries of the director or directress and the teachers of the school, as well as for the maintenance of the pupils. The course of studies extends over a period of two years, followed by a supplementary term of six months to one year for practical training in other branches of rural industry.

The number of applications for permission to establish elementary schools in accordance with these requirements was so great that the ministry was not in a position to satisfy them out of the funds assigned for the purpose, notwithstanding that, including the sum of $6,000 originally set apart in 1844, these funds already amount to $47,000, independent of the subsidies granted to dairy schools. Out of this sum, up to 1894, 50 regularly founded schools have been opened. Subventions from the treasury are granted to 34 of these 50 schools, 5 of them having been founded by private contributions. The entire sum given by the Government amounts to $42,000, making an average sum of $1,235 for each school, the founders expending on their own account $63,000, and on account of the zemstvos (county councils) $16,100, for the maintenance of 8 schools and aid of some of the other 34 schools. Independently of this, out of the funds set apart for the dairy industry $10,000 are granted to 5 dairy schools and 3 girls' schools for training in rural industry and domestic economy. Eight high schools are maintained without any subvention whatever from the Government.

In 31 rural and garden industrial schools the average annual number of pupils in attendance is 41. The maintenance of these 31 schools costs the Government $33,000. The sum expended on these schools by their founders and by the local authorities amounts in all to $64,000. In general the maintenance and instruction of each pupil in the rural industrial schools costs the Government and the founders $72.

The number of pupils received into dairy schools is purposely limited, in order to secure for them a better and fuller training, both in the care of cattle and in every branch of the dairy industry. In the 5 dairy schools there are not more than 55 scholars, giving the average number of 11 for each school, and as $6,500 are assigned by the treasury to these schools, it may be reckoned that each scholar costs about $118 a year.

Besides the dairy schools already mentioned, in two of which girls are also admitted, a number of schools designed exclusively for girls have been established in different parts of Russia by the aid and with the concurrence of the Government. In these schools are received girls not younger than 16 years, and who must previously have gone through the regular course of studies at one of the national schools. They are instructed in those branches of rural and domestic industry with which women have generally to occupy themselves, namely, the

Digitized by Google

management of the dairy, bird breeding, gardening, kitchen gardening, cooking, sewing, nursing, etc. The course extends over two years. Thus, under the administration and care of the ministry of imperial domains, there are, in all, 68 rural industrial schools. The sums expended on their maintenance and the number of pupils receiving instruction in these schools are set forth in the following table:

Class of schools.	Number.	Pupils.	Cost of maintenance. From the Government.	From the zemstvos and founders.	Total.
Higher schools	1	111	$71,000	.....	$71,000
Secondary schools	8	1,186	112,500	$18,000	130,500
Lower schools:					
On a special footing	9	463	41,500	7,000	48,500
On the normal footing, at work	40	1,397	46,000	68,000	114,000
On the normal footing, at work, opened in 1893	10	.....	7,500	33,000	40,500
Total	68	3,157	277,500	126,000	408,500

Besides the secondary schools of rural industry just mentioned, which are under the supervision of the ministry of imperial domains, there are similar schools under the administration of the ministry of public instruction. These are two professional schools—one in the government of Perm and the other in the government of the Taurida (Crimea).

Much attention has lately been directed to the idea that instruction in rural industry, and particularly in the garden and kitchen industry, might with profit be given to the pupils of the national schools. With this purpose in view, special classes for training teachers for the national schools were established. This training was given during the summer in the educational establishments of the ministry, and was supplemented by regular practical training under the immediate direction of the tutors of these establishments. During recent years similar classes have been opened in many of the schools of rural and garden industry.

In all, or nearly all, of the Governments of European Russia efforts are continually being made to show the peasant farmer the importance of tilling his land in a proper manner and under favorable conditions. The government or province of Ekaterinoslav, in southern Russia, is perhaps a fair example of what has been attempted and accomplished in this direction.

The Ekaterinoslav rural administration, with a view to improving peasant agriculture, has established 32 experimental fields in the 8 districts into which the province is divided, making 4 fields in each district. They are always established in the midst of fields owned by peasantry, from whom the land is rented and whose implements are used in tilling. The fields are sown with local seeds of the best quality and much more thoroughly cleaned than the seeds sown by the peasants. All the other operations incident to gathering the harvest are carried out by hiring the same peasants who had sown the fields as day laborers or by piece work, with the object of proving to the peasants that more can be accomplished on the same soil with the same implements. By tilling it more timely and carefully the peasants may receive twice or thrice as good results as they receive at present.

This will make it possible for the peasants on the one hand to reduce the area of land sown and to allot a part for cattle grazing, and on the other hand to insure to their fields the requisite moisture, proper seasoning, and protection against the detrimental effects of drought.

Another object of the experimental fields is to clearly show the importance of

Digitized by Google

the fallow strip of land in the struggle against rank weeds. in the accumulation and retention of moisture in the soil, and in the seasoning of the soil.

As it is not possible to recommend a bleak fallow, in view of economic reasons, the experimental fields contemplate usual fallows, merely broken up as early as possible in the spring. When the summer crops have been sown and the working animals have received from seven to fourteen days' rest, the first plowing of the fallow land begins. The depth of plowing and the number of harrowings and replowings must be entirely regulated by the character of the rank weeds, the amount of moisture, and other local conditions.

Naturally, the object of this is to prepare the peasant population for the transition from a nonsystematic agriculture to a four-field culture, viz, fallow, winter crops, pasture, and summer crops, which is the simplest system, and, as a beginning, is the most suitable one as long as the peasantry complain of having too little land, as well as on account of climatic conditions.

For the management of these fields, teachers are selected in the village schools who enjoy the respect and confidence of the people and who have either been employed in land culture or in farming for themselves, and who have voluntarily offered their services to conduct these experimental fields.

The sum of $25 is allowed by the rural administration for each field. The total harvest return is left to the manager of the field as his remuneration. He must have an experimental field not less than 8 acres in extent, of which one-third must be fallow, the second sown with winter crops, the third with summer crops. He must render an account to the rural administration regarding the quantity of grain, etc., harvested, and that of the neighboring peasant fields, for the purpose of comparison, and must state his relations toward the local residents. All the fields are managed under the instruction and the guidance of the director attached to the rural administration of the province, and the managers of the fields give all requisite explanations to the peasants regarding the preparation of the soil, the importance of the fallow, of good seed, etc., according to the particulars imparted to them by the director.

The annual report for 1895 of the general committee for the installation of school gardens for the province of Ekaterinoslav states that out of the total number of 500 elementary village schools in the province, 227 schools had gardens or kitchen gardens, or both.

The total area under the 227 village schools was 92¼ acres, and the area under the gardens belonging to these schools was 285 acres, making a total of 377¼ acres.

The total number of fruit-bearing trees in these gardens was 14,974; fruit-bearing bushes (currants, gooseberries, etc.), 18,951; young trees (seedlings or saplings) for planting purposes (in nurseries), 77,076; total, 111,001.

The total number of forest trees was 17,996; bushes not bearing fruit, 38,459; seedlings or saplings for transplanting (in nurseries), 181,865; total, 238,290. There were given to peasants for planting: Fruit trees, 13,589; forest trees, 41,759; total, 55,348.

Besides this, 51 schools had apiaries and 10 had silkworm culture.

The sum of $1,568.35 was spent by the management of these schools in the effort to promote the gardens during 1895; but it is considered quite inadequate to the actual requirements, and it has been decided to invoke the aid of the Central Government.

Owing to the scarcity of food for silkworms and the difficulty of finding a market for the cocoons, silkworm raising has proved to be totally unprofitable. Out of the 30 schoolmasters who were engaged in it in 1894 (1½ pounds of grains were hatched) only 10 continued in 1895. At present the mulberry tree is scarce in the South Russian steppes, although it is the intention to plant it extensively for forest purposes. Should this be done, silk culture would probably be very

Digitized by Google

successful. In a country which is naturally destitute of wild berries the first endeavor should be made to grow such trees as bear them.

Bee culture seems to have a good chance of becoming a permanent success, owing to quick returns therefrom. The honey and wax find ready sale, and, besides, the bees do not require such careful protection as orchards.

Kitchen gardens are still more likely to become important, as they supply daily wants. Berry bushes and cherry trees come next in importance, because they give quicker returns and require less care than apple trees, pear trees, apricots, etc.

Vines, if properly selected, correctly treated, and planted in suitable sites, may in time become a very important item in these school gardens, and may induce many peasants to engage in the industry.

Forest trees, it is believed, are likely to have a future only along lanes and roads, in churchyards, graveyards, etc., because, as a rule, the peasants have not sufficient land for grain growing or cattle grazing, and are not able to set aside land for forest trees which give no immediate profit.

In accordance with a request made by the director of the primary public schools to the curator of the Odessa district of public instruction, courses of silk growing and orchard culture at Ekaterinoslav and of silk growing in Slavenoserbsk were established, to last from the 13th of June to the 13th of July, 1895. For the maintenance of the teachers who came to attend the lectures during that period, the sum of $125 was granted out of the special funds of the ministry of public instruction. In addition to this, the ministry of agriculture and state domains granted the sum of $150 for the promotion of this object, while the rural administration of the Ekaterinoslav district gave $100 and that of Novomoskovsk and of Slavenoserbsk $50 each.

The courses at Ekaterinoslav were attended by 26 male and 3 female teachers and those at Slavenoserbsk by 17 male and 3 female teachers, a total of 49 persons. At the first place forty-two lectures were delivered and at the second place thirty-two. In addition, all the requisite manipulations were demonstrated and gone through. Further, at the village or borough of Ivanovka, district of Slavenoserbsk, practical instruction was given regarding apiculture, which was brought to a close by visiting a few model bee raisers in the vicinity. Much difficulty was experienced from the circumstance that many of the teachers, not being practical men or acquainted with any labor in connection with the soil, are better able to grasp a public lecture than to carry out practical work, and also from the fact that obstructions are often placed in the way by villagers, who look upon this matter of horticulture, etc., as a hobby of the particular teacher and totally foreign to school education, which, in their opinion, should consist of mere book learning. Much patience on the part of the teachers is required in explaining to such parties the great desirability of spreading practical as well as theoretical knowledge and inculcating a taste for the work in connection with every variety of gardening.

There are 50 teachers who have taken up apiculture, 20 of whom have gone through the regular series of lectures and received practical instruction, while 30 have derived all their knowledge from books. There were altogether in the 51 apiaries, of which 2 belonged to schools and all the others to schoolmasters, 1,040 hives (containing 416 hives of the old pattern, being hollowed-out tree trunks, and 624 new-pattern hives, which can be taken apart, as they are made of boards and panes of glass); 222 new swarms of bees were recorded as having been obtained on 21 bee farms, while 21 such apiaries out of this number showed a return of 3,604 pounds of honey and 105 pounds of wax. The total outlay for 30 apiaries is given at $2,951.32, while the annual profit is quoted at $248.25.

Digitized by Google

It is of interest to note that some of the teachers have begun to sow small plots of ground with phacelia, reseda, melissa, and other plants of a similar nature, by which means not only more, but better, honey has been obtained than the localities in question produced before.

Instances occur in which it is related that pupils become greatly interested in horticulture and in the growth of trees. These avail themselves of the opportunity to plant young trees, which are always given when asked for by the pupils. The traveling inspector saw ten such gardens which he considered sufficiently satisfactory to induce him to make application for prizes, in the shape of useful books pertaining to gardens, in order to encourage the pupils.

EXPERIMENT STATIONS.

In conclusion, it may be of interest to point out, with reference to stations for the experimental study of rural industry, that up to the present there are very few in Russia that will admit of comparison with those in western Europe.

Of the stations devoted to some distinct specialty and founded by the Government, may be mentioned the following:

The Tiflis silkworm rearing station, which was founded at Tiflis in the year 1887.

The Kharkov bacteriological station, which was established in 1887 for investigating the question of the prophylactic inoculation of cattle as a remedy and preservative against the Siberian plague and other infectious diseases. A sum of $2,500 is granted yearly toward the maintenance of this station.

The chemical station for rural industries, attached to the forest corps, is chiefly devoted to investigations concerning the nature and properties of different soils.

The Caucasian experimental station, in the Koutias government, has for its main object the cultivation of American vines and their acclimatization in Russia.

The Government cotton plantations—one in Tashkend, in the Syr Dariensk district, and the other in the Tiflis government, on the Government estate at Karayask—are showing excellent results.

There are also two rural industrial stations, one for investigations, in the Orlov government, on the estate of Count Tolstoi; the other, experimental, in the Petersburg government; also three establishments, under the administration of the ministry of public instruction, namely, the chemical experimental station for rural industries, attached to the polytechnic school at Riga; the agronomical laboratory, attached to the university at Kiev, and the technical laboratory, attached to the Kiev department of the Imperial Russian Technical Society.

Among the farms and grounds established by local governments and societies for promoting the experimental study of rural industries, some have either been opened on Government lands, of which a free grant had been made for that purpose, or else they receive a money subvention from the Government. Such are the three experimental farms founded by the zemstvos of the Perm government and the Kharkov, Poltava, and Kiev experimental grounds, as well as those established by the Viatka local authorities, the Odessa experimental station, and the experimental ground under the administration of the Imperial Society for the Furtherance of Rural Industries in Southern Russia.

There are others which receive no Government subsidy, such as the seven stations for seed sowing in the botanical gardens at St. Petersburg, Helsingfors, Kiev, Guriev, Riga, Tver, and Warsaw.

MOSCOW.

Under date of March 24, 1898, United States Consul Smith writes:

There are a number of agricultural schools in Russia, with departments for sheep breeding, for domestic industries, and for instruction in the distillation of

Digitized by Google

wines and spirits. The Government appropriates for these schools 300,000 rubles ($154,200) annually. They are not sufficient to provide all the instruction required, and special classes for teachers have been formed, principally in the provinces of Viatka, Novozibkoff, and Livnsch; but these seem to be of short duration. In the town of Jizdra there is a yearly class, excellently conducted, for teaching gardening, fruit culture, etc.

WARSAW.

United Stated Consul Rawicz, under date of November 12, 1897, says:

I have ascertained that two schools for gardeners, which existed for a number of years at Warsaw and at Czenstochowa, were closed two years ago.

During the present year, however, the educational department has opened at Warsaw, at the pomological garden, a gardeners' school, to prepare instructors for the country gardeners; but, as the institution has existed only a couple of months, it is impossible to say anything about its usefulness or prosperity.

SCHOOL GARDENS IN RUSSIA.

Under date of July 17, 1897, United States Consul-General John Karel sends the following report:

In a good many countries of western Europe, especially in Germany, Austria, France, Belgium, Switzerland, and partly in Sweden, the public village schools have sections of land allotted to them, which are either devoted to the use of the teachers, who take the profits therefrom, or serve for the establishment of school gardens. School gardens in western Europe bear in a certain measure a scientific character. Children are made to carry out in them practically what they learn about them theoretically.

In Russia, since the ascension to the throne of Emperor Alexander II, and since the liberation of the serfs in 1861, and of the Crown peasants from the jurisdiction of the ministry of Crown domains, the system of developing agricultural industry has completely changed in everyone of its branches. It was well known that the landowners and peasants were in great need of instruction in farming; consequently schools of all kinds were established by the ministry of agriculture throughout the country. Many schools were endowed with lands, and already in 1843, according to the regulations for public parish schools in villages of Crown peasants, sections of land for kitchen gardens, taken from the Government lands, were attached to these schools for the benefit of the teacher or his assistant. For the development of the gardening industry, schools were founded first in Penza in Bessarabia, near Kishinev, in the town of Verny of the Semirechinsk district, and in 1869 a school of gardening and viticulture was founded at Nikitsk. The work of the Nikitsk school was divided as follows: During the winter semester there were three hours of lessons per day and four and one-half hours of practical study in the garden, vineyard, and in the cellar. During the summer semester the lessons in class lasted only one hour, or sometimes two hours, but the practical studies occupied daily six and even eight hours.

In 1875, according to the regulations of the ministry of public instruction, for one and two class schools, the opening of such schools was permitted on condition that the founder would endow any such school with not less than one desiatina (2.6997 acres) of land. Many village schools in Riga and Warsaw districts possess lands granted to them by the local laws to insure their maintenance, and the use of the land is given to the teacher as a part of his compensation. By giving

Digitized by Google

land to schools in those districts, and also to those in the villages of Crown peasants, no scientific aim was in view. The same question is raised now that it is proposed to grant Government lands for school needs in the newly organized villages of emigrants who settled on the free Government lands in Siberia.

The movement for developing a knowledge of gardening began in the seventies, but on account of the small interest taken in agricultural occupations many teachers did not devote their attention to school gardens, which consequently remained uncultivated and were not a source of profit. In 1887 the ministry of agriculture and Crown domains took special steps to encourage and facilitate the establishment of school gardens. They distributed plants and seeds, and to certain provinces sent expert gardeners to instruct teachers how to organize and direct garden operations. In different provinces courses in some one branch of agricultural science were organized for the purpose of acquainting the teachers (male and female) of village primary schools with the work, and to the best and most energetic were given gratis manuals on gardening (by I. I. Meschersky and W. A. Alexandrov), and other books, implements, and seeds. Besides, the ministry gave subsidies to some of the zemstvos[1] for the organization of similar courses and pecuniary assistance for teaching gardening and farming in seminaries and in some of the lower schools.

For the further encouragement of teachers, the ministry began in 1895 to give, through the ministry of public instruction, to the most successful in the dissemination of agricultural knowledge premiums to the amount of 50 rubles each as a reward. In 1855 61 teachers received such premiums; moreover, during recent years some teachers have received medals and official acknowledgment of their labors; others, again, medals from different societies and medals at expositions. But the principal inducements for the teacher to occupy himself with gardening are the income derived from the sale of fruit trees, fruit, berries, vegetables, honey, wax, cocoons, hops, etc., and the providing of vegetables enough for himself during winter.

In some cases, and especially at the beginning, the local school administrations were not in favor of teachers occupying themselves with such work, in consequence of which the ministry of public instruction issued a circular in 1894 directing the school councils, directors and inspectors of public schools, and through them the local school administrations, to take such measures as would be found, according to the local conditions, necessary for the organization of school gardens, as well as for sowing cereals and grass where a sufficient amount of land was available, and to invite village and town societies and zemstvos to organize garden societies. The circular required, also, the directors and inspectors of the public schools to state in their reports what schools endowed with land have school gardens and what ones have not; to state the reason why not, and to suggest measures which may be necessary for their establishment.

The above-mentioned course adopted by the ministry of public instruction, and the approval of the teachers' activities in that direction expressed by the Emperor at three different times, gave an impulse to the development of school gardens and of the branches of agricultural industry pursued in the schools. Besides, the desire to add something to the low salaries of the village school-teachers and, on the other hand, to acquaint as much as possible not only children, but also grown-up people, with gardening, sericulture, and apiculture has caused an increase during the last ten years in the number of school gardens, apiaries, and silkworm hatcheries. In 1892 there were about 2,000 school gardens in Russia. At the present

[1] Zemstvos are special bodies composed of landowners existing in 34 of the governments for the administration of economical affairs.

Digitized by Google

time there are 7,521, with 532 apiaries and 372 silkworm hatcheries, which are distributed as follows:

In zemstvo governments.	Number of school gardens.	Apiaries.	Silkworm hatcheries.
Bessarabia	79	2	11

As an experiment, with pecuniary assistance from the ministry of agriculture, at some of the schools of the ministry of public instruction and the holy synod, and also in some of the kindergartens, classes in gardening and farming have been organized. At present this instruction is given in 23 schools, namely, in 7 normal schools, 6 elementary schools, 7 parish schools, in 1 elementary school of the Empress Maria, and in 2 kindergartens.

Besides, in 1897 the department of agriculture provided pecuniary assistance for organizing agricultural classes in three village schools: Beloiarski in the Shadrinsk district, government of Perm, and on estates Zatishie and Kiloshitsy, district of Luga, government of St. Petersburg.

THE OBJECT OF SCHOOL GARDENS.

Mr. I. I. Meschersk, who is chief of one of the departments of agriculture, and one of the principal advocates of school gardens in Russia, has stated the object of school gardens and their significance as follows: "School gardens," he says, "which are being organized at present at public schools in many governments of European Russia, are of importance on the following grounds: (1) Hygienic, as being a place for physical labor in the open air, so necessary for the teacher and pupils who have been kept confined in the bad and heated air of public schools; (2) scientific educational, as acquainting children with the life of useful plants, developing their minds by the study of nature, and promoting in the rising generation a regard for labor and a more moral and æsthetic sentiment concerning trees; (3) general economical, as spreading among the people new knowledge relating to gardening, kitchen gardening, and to the farming industry in general, and thereby leading to the production of such food articles as the people of some localities do not now possess; and (4) personal economical, as regards public teachers, who may avail themselves gratis of the products they have grown, such as fruit, vegetables, etc., and besides get some income from the sale of the superfluity of these products and from the cultivation of plants and seeds. The same refers also to school apiaries, silkworm hatcheries, trial fields, and to school farms in general."

A school garden, to answer the purpose for which it is intended, should include:

(1) An orchard, from which might be procured grafts, and, in the south, also a vineyard.

(2) Berry bushes and stone-fruit trees.

(3) Nurseries of fruit, berry, and forest trees, or an ornamental plot for growing young plants.

(4) A kitchen garden; if possible, with a hothouse.

In addition, it is desirable to have decorative trees and a flower garden. Sometimes hops, mulberry trees, balm mints, melliferous plants, etc., are planted.

The management of the garden must conform absolutely to the local conditions.

The size of a school garden depends in part on the amount of land procurable. The normal size of the garden may be considered from three-fourths of an acre to 1¼ acres.

When there is a large area of land connected with a school, the teachers generally utilize it by sowing field crops or growing kitchen-garden and other plants with a view to profit.

At the Nizshni-Novgorod exhibition in 1896 the commission for organizing the educational section for the ministry of public instruction, in constructing a building for the representation of a village elementary school, found it desirable to have a school garden attached to it, which would give visitors an idea of the character of school gardens and of the mutual relations of the different operations which are carried on in them. The forming of the plan was intrusted to W. Pashkewicz, a specialist in gardening at the department of agriculture, with the assistance of I. I. Meschersk, the former secretary of the society, and a secretary and member of the commission.

The model school garden arranged on the exhibition grounds was not large, as it contained only 1,225 square yards. To organize a garden of normal size (from three-fourths of an acre to 1¼ acres) was difficult, and even impossible, owing to lack of space and to the high cost of material and of trees, which had to be bought fully grown.

The school garden at the exposition consisted of (1) a nursery, (2) a kitchen garden, (3) plots of berry bushes and stone-fruit trees, and (4) fruit trees.

A plan of the above-mentioned model school garden, with explanations, is attached to this report.

COURSES FOR PUBLIC-SCHOOL TEACHERS.

With a view to acquainting public-school teachers with horticulture, gardening, and other branches of agriculture, the department of agriculture began to organize in 1891 short courses on these subjects at the agricultural and garden establishments under the control of the department, and in other localities. These classes are held generally in summer, when the public-school teachers have their vacations, and run from one to one and one-half months. Other persons besides the teachers may attend such courses, but only by special permit from the department of agriculture. At these courses there are delivered lectures on the local farming industry and the easiest way to improve it. At the end of the courses the students undergo an examination, and to those who pass satisfactorily certificates are given in which it is only stated how long the student has attended the courses, but nothing is said about his progress in his studies. And to those who have been the most successful in their studies at these courses are given, as rewards, garden instruments, books, seeds, and plants. Such courses were designed to be held at the following institutions in 1897:

(1) At the Goretsk Agricultural School, with one and one-half months' course, from April 20. For admission to this course a certificate from the directory of public schools is required.

(2) At the Uman Agricultural School, from May 15 to July 1, on horticulture, gardening, sericulture, and apiculture. On entering these courses the public school teachers must present a permit from their superiors. The number of students is limited to 60. Preference is given to public-school teachers who have plots of land attached to their schools. The persons attending these courses can hire lodgings with board in the neighboring village at from 10 to 15 rubles ($5.14 to $7.71) a month.

(3) At the Marinsk Agricultural School, from the middle of April to June 1, on gardening and apiculture. Persons wishing to enter these courses must present a petition to the director in due season.

(4) At the Kazan Agricultural School, from April 25 to May 25, on gardening, kitchen gardening, and apiculture. Applicants must send in a petition to the director not later than April 15, and also a certificate of their identity. The number of students is limited to 30.

(5) At the Kharkov Agricultural School, from May 1 to June 1, on gardening, apiculture, and sericulture. Here preference is given to public-school teachers who have land connected with their schools and who have a better scientific education. Thirty students are received to these courses.

(6) At the Bessarabia School of Œnology, on viticulture and wine making, in July.

(7) At the Marino-Garsk Agricultural School, on horticulture and gardening, from May 1 to June 15.

(8) At the Uspensk Agricultural School, from June 15 to July 31, on gardening and horticulture. The number of students limited to 20; preference given to teachers (male and female) whose schools have land connected with them. Board and lodging can be had at the neighboring village of Smolensk, at 10 rubles ($5.14) per month.

(9) At the Burashev School, on gardening and agriculture, from May 15 to July 1.

(10) At the Ekaterinoslav School Garden, from June 1 to July 1, on gardening, apiculture, and sericulture. Public-school teachers wishing to enter those courses must present, together with a permit from their superior, a petition to the committee for the organization of school gardens in the government of Ekaterinoslav, which committee is attached to the Ekaterinoslav section of the Impe-

Digitized by Google

rial Russian Gardening Society. All other persons must address their petitions to the curator of the school about a month before the beginning of the courses.

(11) At the Kon-Kolodez Agricultural School, in May, on horticulture, gardening, apiculture, agriculture, cattle breeding, and natural history.

(12) At the Kokorozensk Agricultural School, in June, on apiculture, gardening, and entomology, and in September on viticulture, agriculture, and cattle breeding.

(13) At the Lubensk Agricultural School, on apiculture and dairy farming.

(14) At the Odessa School Garden, from June 15 to July 15, on gardening and kitchen gardening.

Similar courses were to be held further at Ostaklov, Menzelinsk, Tiflis, Uralks, and at the Shubin-Wakhtinsk Farming School.

Besides the nineteen foregoing organized courses and lectures, the ministry of agriculture and Crown domains, in compliance with intercession made at the beginning of 1897, found it desirable to assist the establishing of similar courses at six other places.

W. A. Alexandrov, in his last pamphlet on the organization of courses for school gardens in 1896, says:

School gardens are very desirable institutions at public schools on pedagogical grounds, for emphasizing their scientific and educational features in a direction necessary for farmers' children. In school gardens consisting of nursery, orchard, kitchen garden, apiary, silkworm hatchery (in southern Russia), and an experimental plow field, and also on excursions made for the purpose of studying natural history and agriculture, the school-teachers could in a short time design a short and practical course of natural history as an introduction to agricultural education. The teacher, leading pupils to the desired end through investigations and experiments at the school garden and during excursions, is in a position to promote the conscious acquirement of knowledge, and consequently the development of the mind for an independent activity, and to give to the pupil a more serious view of his relations to natural objects and phenomena and to his own observations. For all children, and for peasants' children especially, it is necessary, first of all, to learn to observe, then to note what they observe, to classify their observations, in order to understand why and wherefore this or that happens, to deduce from these observations and experiments natural laws and fundamental principles, and thus to learn to examine deeper the surrounding objects. Besides, school gardens are very desirable for peasants' children from an educational point of view. In working together with the teacher, or separately at their sections in nurseries or kitchen gardens, at the trees in orchards, or at the beehives in apiaries, they get into the habit of working consciously and practicing economy in exploiting the gifts of nature.

In Russia there are 40 gardening organizations, of which 2 receive a permanent subsidy from the department of agriculture, and the majority receive pecuniary assistance from different sources, including gardening expositions. When in 1896 the department of agriculture had under consideration measures for the further development of fruit and kitchen gardening, it decided to collect from the gardening organizations of Russia their views and suggestions of measures which would be most expedient and well timed for the amelioration and development of this branch of agriculture, and issued requests to that effect addressed to the said organizations.

Up to the present time 35 societies have answered and presented reports containing valuable suggestions on the subject, which have been partly published in Izwiestia (Information), a journal published by the ministry of agriculture and Crown domains.

For much of the foregoing information the writer is under obligation to Mr. E. Kovalevski, a member of the scientific committee in the ministry of public instruction, who takes an interest in school gardens.

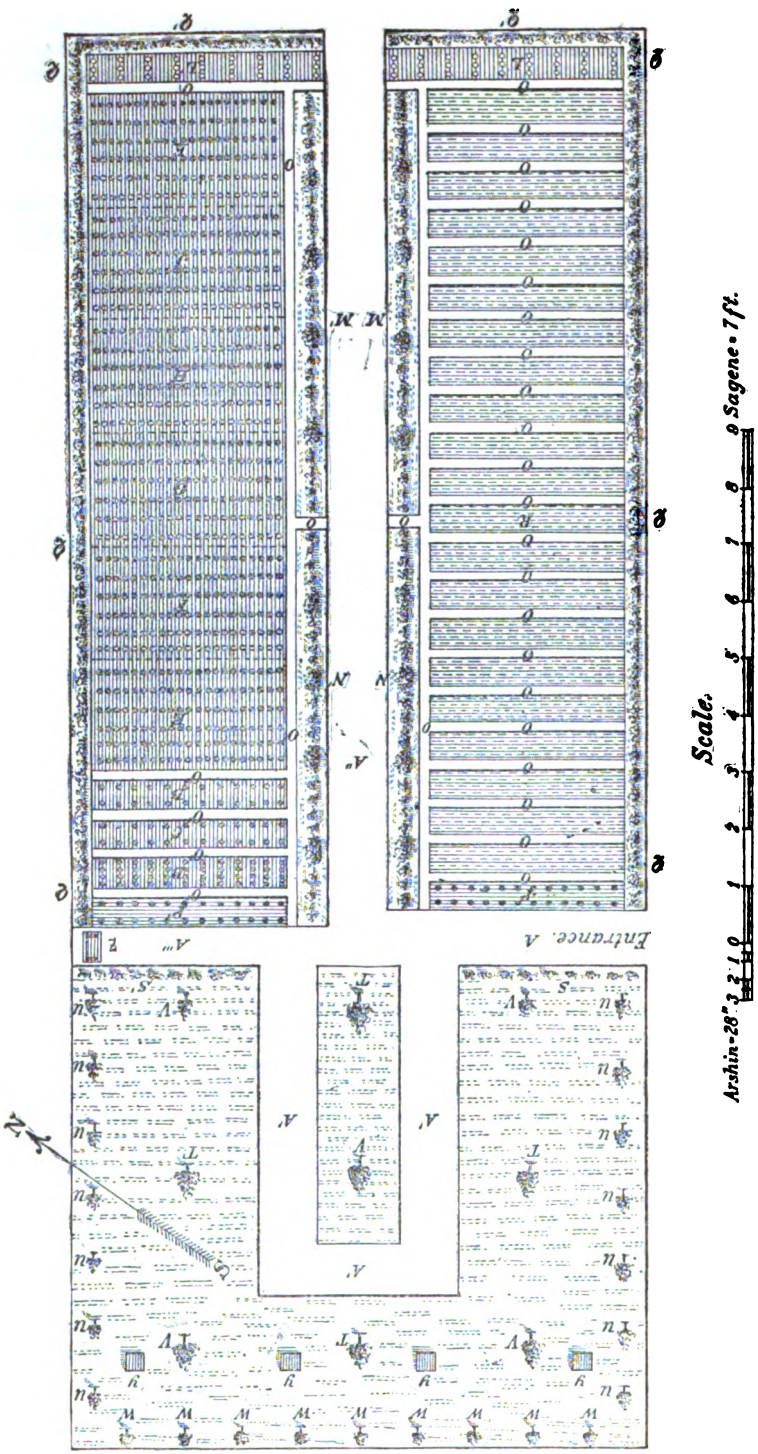
PLAN OF MODEL SCHOOL GARDEN

AS ATTACHED TO PRIMARY SCHOOLS IN RUSSIA, ARRANGED AT THE EXHIBITION GROUNDS IN NIZHNI NOVGOROD IN 1896.



Digitized by Google

EXPLANATION OF THE SCHOOL-GARDEN PLAN.

A, A′, A″, paths 7 feet wide.

A‴, paths 6 feet wide.

P, P′, beds planted with seeds of vegetables, 42 inches wide.

B, bed planted with seeds of fruit trees, holes 1¼ inches apart.

C, D, grassy beds, with seedlings of pear and apple trees planted in checkerboard order, with a distance of 14 inches between the rows and 3¼ inches between the trees.

The nursery is divided into six beds, E, F, G, H, J, and K.

E, seedlings transplanted in spring from beds C and D, where they have passed the preceding summer after being taken from the seed beds. In summer the apple and pear seedlings are grafted with a leaf bud.

F is allotted for yearlings.

G is allotted for 2-year-old trees.

H is allotted for 3-year-old trees.

J is allotted for 4-year-old trees.

K represents a fallow worked over again, manured with fresh manure in the spring (but which can be done in autumn), and planted generally with cabbages. The following year such a bed is planted with seedlings.

Each of the above-mentioned six beds has six rows: Three rows of apple trees, one of pear trees, one of plum trees, and one of cherry trees, and the rows are 28 inches apart. In each row are 21 trees, which are 14 inches distant one from the other.

L, L′, beds planted with berry bushes 3¼ feet apart, and stone-fruit trees (cherries) 10¼ feet apart. The border along the path is set out with mentha.

R, kitchen garden, divided into three fields, with twenty-one low beds running parallel with path A. The width of the beds is 42 inches, the width of the intermediate furrows 14 inches.

The first section of seven beds, fresh manured, is planted with cabbages; the seven beds of the second section are planted as follows: Three beds with cucumbers, one and one-half beds with carrots, one and one-half beds with radishes, one bed with turnips, rape, and parsnips. The seven beds in the third field, which are manured with ashes, are planted as follows: Three beds with turnips, two beds with beans and peas, and two beds with onions and garlic.

O, O′, furrows between the beds, 14 inches wide.

Q, a hedge around the garden.

N, N′, beds planted with cherry trees 10¼ feet apart, and, in the space between, gooseberry bushes 3¼ feet apart. The border along the path is set out with sage plants.

ORCHARD.

T, pear trees, and V, apple trees, are planted 21 feet apart, and alternated so as to let the broad-spreading apple trees extend their branches between the pear trees.

U, plum trees, planted 8¼ feet apart.

W, nut trees, mountain ash, box thorn (*amelanchus*), and *Hippophæ rhamnoides*, intermixed, 7 feet apart.

Y, four frame beehives.

S, S′, raspberry bushes planted in rows.

Between the trees in the fruit gardens usually potatoes are planted.

EDUCATIONAL INSTITUTIONS AND METHODS IN COREA.

Horace N. Allen, United States consul-general at Seoul, reports under date of July 12, 1898:

The education of Corean children is usually carried on at home. Several families may unite and employ a teacher, who will instruct the boys in the use of the Chinese character and in the principles of the Chinese classics. Well-to-do fathers usually provide their boys with a private tutor. Girls are not usually taught to read. Of late the publication of numerous papers, periodicals, and religious pamphlets in the native character called ernmoun is aiding in the spread of a knowledge of the Corean language, which is much easier to learn and more expressive than the cumbersome Chinese, which latter all officials must know, since the Chinese is used in all official documents.

I inclose a clipping from the Seoul Independent of July 5, relating to the general system of education now being followed in Corea. Through the kindness of the various foreign teachers, I am able to give an intelligent account of the work the foreign schools are doing.

Digitized by Google

In 1883 an English school was started in Seoul, under the care of an Englishman—T. E. Halifax. The school was kept running for a couple of years, but the chief work was done in the eight months prior to the bloody emeute of 1884. Most of the really first-class interpreters now in government employ were pupils in this school and got their knowledge of English during this period of eight months. The Coreans are very quick in acquiring a knowledge of foreign languages.

In 1886 a school was started in Seoul, under the charge of three teachers selected by the Department of the Interior at the request of the State Department of the United States, in accordance with repeated requests from the Corean Government. These gentlemen—Messrs. Gilmore, Hulburt, and Bunker—served in this capacity for varying periods till the school finally closed in 1894. Some of their former pupils now hold positions of trust and importance in the Corean Government. The school did good work in a small way, but did not accomplish what was expected of it, owing to great opposition from certain quarters to anything of the kind at the time.

The present favorable aspect of education in Corea really dates from the Japan-China war, and I shall mention the schools separately, using the information given me by the respective teachers.

AMERICAN METHODIST SCHOOL.

The mission of the American Methodist Church maintains a flourishing school, which was originally started in 1886 under the name of Pai Chai "Hall for Rearing Useful Men," a name conferred upon the school by His Majesty. Under an agreement made with the Corean Government in 1896, a certain number of pupils are placed in this school by the Government upon a compensation of $1 silver (50 cents gold) per month. The Government further pays for a native teacher for every 50 scholars. The course of study, discipline, etc., is entirely in the hands of the mission. Attendance at chapel and at Sunday service is compulsory. Beginning with an attendance of 50 in 1895, the school has now 103 pupils; and 176 were in attendance at the close of last year's term—June, 1897. Japanese and Chinese youths are also received at this school. The school has 2 foreign teachers and 4 native assistants, with 3 instructors in the Chinese character. A very highly appreciated course of lectures has been a prominent feature during the past two years, being delivered by native-born Coreans who have lived long abroad and become thoroughly familiar with matters that interest the outside world. No money is given to any of the pupils of this school except for services rendered. Poor boys are given employment in the mission printing press or bookbindery, and they thus learn a useful trade while helping themselves to a general education. A theological course was at one time furnished at this school, but it has been discontinued. The boys wear a uniform, and they have some drill in gymnastics and military tactics. One prominent feature of this school is the debating society, in which the boys have shown a remarkable aptitude for public speaking. From the course of study sent me by the principal, Rev. H. G. Appenzeller, I find that the preparatory course extends over three years. Reading, writing, and spelling are taught in the first year; geography, arithmetic, and composition in the second; and history, algebra, drawing, physiology, and a course in the New Testament in the third. This is followed by a regular college course, which is only arranged for, however, through the sophomore year.

NORMAL SCHOOL.

Seoul has another American school, taught by Rev. H. B. Hulburt, one of the three teachers sent from America in 1886. Mr. Hulburt's present school was started in 1897. It is meant to be a normal school for the drilling of native teachers, who may go out and take charge of primary schools for the people. It was the idea of the Government, in starting this school, to use the teachers prepared in it for establishing a regular system of public schools throughout the country.

Digitized by Google

One of Mr. Hulburt's functions is to prepare text-books for the use of these schools, a work in which he has had considerable experience. It is unfortunate that in connection with this normal school the Government has established a school for the teaching of English to the sons of nobles, thus preventing the teacher from devoting his time to his legitimate work, as he desires to do. There are at present enrolled in the normal school 30 scholars, while the English school, under the same teacher, has 35 students. The principal has 1 native assistant in the English department at a salary of $20 silver ($10 gold) per month, and 2 assistants in the normal department who receive $42 ($21) and $20 ($10), respectively. The last two teach only the Chinese classics. As to the work, Mr. Hulburt says:

My work being, then, of a double nature and the assistance of little value, I found it necessary to confine the curriculum for the first year to arithmetic and general geography. During the first year the men completed and thoroughly reviewed the whole of an intermediate arithmetic, the application of every part of which I adapted to Corean life and customs. This, in view of the utter lack of text-books, is most encouraging, and shows that the Coreans have good capacity along scientific lines. I found among the whole class three or four men who are exceptional mathematicians, even when judged from the standards of America or Europe. In the study of geography, I found that the interest was sustained, and the men applied themselves vigorously. The difficulty in the pronunciation of foreign names, and the fact that the Chinese books have transliterated the geographical names in such a grotesque manner, has been something of an obstacle; but in this branch I have made use of a gazetteer of the world, which I published some years ago in the vernacular, and in this way I have succeeded in weaning them away from the Chinese pronunciation, which is so misleading. During the first year the men have completed the study of Europe, Asia, and North America. In addition to ordinary geographical matter, they have been taught the facts concerning the military and naval strength of the different nations, their foreign policy, their relative power, their educational and religious status, and a large amount of other special matter.

I have quoted Mr. Hulburt thus at length, as he is the only one of the teachers who has given me such an insight into the methods and results of teaching the Corean mind. Mr. Hulburt has a five years' contract with the Corean Government, one year of which has passed. His pay is $225 per month for the first year, increasing $25 per month during the second, third, and fourth years, to $300 per month for the fourth and fifth years (equal to half these sums in gold). The school buildings are not at all suited to the work, but will probably be improved. The normal students are housed and fed by the Government at an expense of $5 ($2.50 in gold) per month each. The English students are given their midday meal.

GOVERNMENT JAPANESE SCHOOL.

The Government Japanese Language School (Nichigo Gakko) was organized in 1891 to teach the Japanese language, geography, history, political economy, and "the popular sciences." It has a course of study extending over three years. There have been 11 graduates from this school, which now has an enrollment of 61. Text-books, stationery, and the midday lunch are provided by the Government. Uniforms are not provided, though there is instruction furnished in military gymnastics. The buildings are foreign adaptations of Corean houses and have 3 class rooms, 1 dining room, 1 office, making a total of 1,440 square feet of space, with a playground of 10,800 square feet. The school has a Japanese head master, an assistant master (Japanese), and two Corean assistant teachers. The assistant teachers get $300 and $240, silver, per annum. The head master receives a salary of $1,500 and the assistant master receives $480 per annum (equal in gold to one-half these sums).

PRIVATE JAPANESE SCHOOL.

The Foreign Education Society of Japan also maintains a school in Seoul, called the "Keijo Gakko." This was organized in April, 1898, "as a token of the sincere sympathy for the lack of a sound educational basis in Corea, with the view of

Digitized by Google

giving a thorough elementary course of instruction to Corean youths, and thus aiming to form a true foundation of the undisputed independence of that country. Among the active members of the society are Messrs. Oshi-kawa and Holdo, most prominent Christians in Japan, and the teachers in charge of the school are graduates of the Kyoto Doshisha School. It is supported by the voluntary contributions of philanthropists resident in Japan and Corea. It endeavors to teach all popular sciences, both in Japanese and Corean." This school has two ordinary courses—higher and lower—of three years each, and a special course for the teaching of the Japanese language of one year. There are four teachers, who receive only the actual cost of their living. The cost of the maintenance of the school is $3,000, silver ($1,500, gold). The school building is a Corean house remodeled, with five class rooms and quarters for the head master. No charge is made upon the pupils, who are also furnished with text-books and stationery free. Three dollars per month is given to meritorious students, and the best scholar is sent to Japan for further education at the expense of the school. The enrollment is 190. with a daily attendance of 100. No uniforms are supplied or worn.

CHINESE SCHOOL.

On May 1, 1897, the Corean Government engaged a Chinese teacher from Pekin, at a salary of $70 per month for the first year, $80 per month for the second, and $90 per month for the third, to teach a Chinese school, with the object of turning out good Chinese interpreters and giving them a knowledge of the Chinese literature and classics. The school has a daily attendance of 35. The age of the pupils varies from 15 to 30. A school building and residence for the teacher is furnished, and the cost of maintenance, aside from the teacher's salary, is $100 per month. The scholars are given 5 cents per day for lunch. The students are divided into three classes, and school lasts from 9 a. m. to 3 p. m., with one hour for lunch. There is no session on Saturday afternoon or on Sunday.

RUSSIAN SCHOOL.

From the Russian teacher, Mr. Birukoff, I have the following facts regarding the Russian Language School. This school was established in April, 1896, and numbers at present 88 pupils. These are selected now and then by the educational department, family influence having much to do in the selection. Pupils receive 5 cents per day for a midday lunch. The foreign teacher receives $180, silver, per month, with house, and at present he also has $40 extra per month for drilling the scholars during recreation hours. He has 3 assistants (natives), 1 especially engaged and 2 who have been selected from the best of the pupils. The first receives $15 per month, the second and third $10 each. No pupils will be graduated prior to January, 1899. The school has at present four courses, but this number is arbitrary and may depend upon the number of pupils and their progress during the year.

As a rule, the Corean pupils show a special interest in geography and history and very good aptitude for mathematics. They write well, as far as orthography is concerned, but their syntax is rather feeble. The greatest nuisance is the abominable pronunciation of Russian words, which sometimes make the speech of even the best pupils nearly unintelligible.

FRENCH SCHOOL.

One of the most successful schools in Seoul is the French school under Mr. E. Martel, although it has only been in fair running order since January, 1896. French interpreters are met with at all Government departments and at the homes of many high officials.

At the commencement of this school it only had an enrollment of 17 pupils, none of whom knew any French. The number of pupils has steadily increased, until it now has 100 in attendance, with 4 assistant teachers, chosen from the first

Digitized by Google

class. The plan of this school is to turn out good interpreters and teachers of the French language, and at the same time to give them a working knowledge of arithmetic, history, geography, and bookkeeping, so that they may be fitted for the posts of clerks and assistants in the Government service. The final examination for this year, which has just been held, covered the following branches: Reading, dictation, arithmetical problems, composition, chartography, oral geography, grammar and parsing, conversation and translation, commercial bookkeeping, and geometry. The cost of maintenance, in silver, is as follows: One assistant teacher, $20 per month; 3 assistant teachers, $15 per month each; 2 servants, $4 per month each, and the scholars are furnished stationery and a midday lunch. The allowance for 1896 was $800 ($400, gold); for 1897, $2,026 ($1,013, gold), and for 1898 it is $2,200 ($1,100, gold).

ENGLISH SCHOOL.

The most important of the foreign-language schools and the one with the best equipment is the English school. The head master, W. Du Flon Hutchison, is a professional teacher of much experience, and he has as assistant master T. E. Halifax, who taught the first English school in Corea in 1883. The school was begun in November, 1894, using as a nucleus some students from a naval school Mr. Hutchison had been conducting with the aid of some English officers on the island of Kang Wha. The British residents have done a great deal in the way of encouraging the scholars of this school by contributing toward the purchase of neat and appropriate uniforms, teaching them such games as football and other college sports, in which the boys do excellently, and in offering prizes for the winners in the various sports. The boys now buy their own uniforms, which consist of a Norfolk blouse of dark-blue navy serge and well-lined trousers to match for winter, while in summer the same style is used with brown khaki as the material. The boys wear a flat cap, which compels them to cut off the absurd topknot such as has been worn by their fathers for centuries, and their appearance is thereby greatly improved. It is the plan of this school to give the young men an idea of general knowledge, in addition to the use of the English language. The masters desire rather to make manly youths of their boys, hoping that they may be induced to continue their studies, or at least have a desire for knowledge greater than they would have otherwise possessed. The school has had many backsets. A fine new new building was taken away from them for some other purpose just as it was completed. A drill sergeant loaned to the school by the British admiral was allowed to leave, and they complain of having to work under many difficulties. The scholars of this school are from the middle classes, which probably accounts for much of the school's success; since a teacher, however well qualified he might be, would be able to do little with the nobles' sons unless they were made to obey rules. The pupils receive stationery and lunch, and the cost of maintenance, exclusive of the teachers' salaries, is $4,230 ($2,115, gold) per annum. The teachers receive pay as follows, per month in silver: Head master, $300; assistant master, $250; 1 native teacher at $25, 1 at $20, and 3 at $15 each. There are 120 scholars enrolled in this school, with an average attendance for 1898 of 110.

CATHOLIC MISSION.

Besides the above-named schools, the Catholic mission under the French fathers maintains an important theological seminary here, where men are educated for the ministry. The teaching is in Latin, and a number of native priests of the church have been educated there.

MISCELLANEOUS.

The Methodist, Presbyterian, Catholic, and other missions support schools for little girls, where the children are taught Corean and useful things. These are rather homes than schools.

Digitized by Google

There have been many military schools in Corea at various times under the charge of Americans, Japanese, English, and Russians. These have all passed away, and the Coreans have just organized a military school of their own, with no foreign instructors. I understand it is to be more of a school for drilling new officers than anything else. It is the intention to take the tactics and commands they have received from their previous instructors and combine them into an "improvement of each," which will have the Corean language as a medium of communication. It has been a source of comment heretofore that English and Americans, Russians, and Japanese could hear the officers giving commands each in his own language, much to the bewilderment of the native soldier.

A German teacher has just arrived from work in Japan to open a school in Seoul for teaching the German language. He is under contract for three years, with $200 per month for the first year, $250 for the second, and $300 for the third (silver). He is to have $30 per month also for house rent.

HORACE N. ALLEN,
United States Consul-General.

SEOUL, *July 12, 1898.*

[From the Seoul Independent, July 5, 1898.]

Besides the foreign-language institutions there are 10 schools under the care of the department of education. Of these, 1 is a normal school with 30 students, whose curriculum consists of reading, composition, arithmetic, geography, history, and dictation. The institution has 2 Corean teachers, one receiving $56 and the other $15 a month for monthly salaries. Nine are primary schools, located throughout the city, with the total enrollment for this year of 838 boys. The course of study adopted in all these schools is composed of reading, composition, arithmetic, geography, history, writing, and gymnastics. Teachers are appointed on the ratio of 1 teacher to every 30 pupils. The monthly salary of a teacher ranges from $15 to $25, according to the term of their service. The annual estimate allowed for these 10 institutions amounts to $14,416.

There are 21 local primary schools stationed in principal centers in the country, each receiving from the department of education $30 a month.

While this condition of the primary education is better than nothing, we certainly believe that it can and ought to be improved. The department of education we believe to be a farce. All the business it does or pretends to do can be done—and better done, too—by one chief of a bureau and a few able chusas. But if the farce is to be kept up as a kind of necessary evil in the official system of the Government, let the evil be run as economically as possible by dismissing the majority of the secretaries and chusas and runners, who are paid for doing nothing. The money thus saved should be spent in improving the existing schools and in establishing new ones.

LEIPSIC COMMERCIAL UNIVERSITY.

The merchants of Germany for some time past have recognized the value and necessity of giving young men who intend to follow the commercial industries information in connection therewith. The business men of Leipsic, under the auspices of the Leipsic Chamber of Commerce, with the advice and consent of the royal ministry of the interior and the academical senate of the University of Leipsic, will open on the 23d of April, 1898, a commercial university, the first of its kind in Germany. There are, of course, many expenses in connection with the establishment of this institution, which will be paid by the Leipsic Chamber of Commerce. The royal ministry of the interior and the council of the city of Leipsic have, however, promised to contribute something toward defraying the running expenses for the first two years at least.

The establishment of such schools will be found to be most beneficial to commercial careers, and their methods and teachings can not fail to impress upon the minds of the students the great value of these institutions as a means for increas-

Digitized by Google

ing one's business knowledge, and also for the perpetuation and upbuilding of a country's commerce and industries.

This subject is well worthy of thoughtful and careful consideration, not only by our boards of education, but by the boards of trade of our large cities.

The following is a brief plan of the Leipsic Commercial University:

The management is placed in the hands of 12 men, who are chosen to serve for a period of two years. This body is called the commercial university senate, and is composed of one representative of the Royal Government, one of the city of Leipsic, the president and two members of the Leipsic Chamber of Commerce, three professors of the University of Leipsic, who are appointed by the academical senate thereof, two professors of the commercial university, appointed by the president thereof, and the director of studies. The president of the chamber of commerce is chairman of this commercial institution until further notice.

The director of studies is appointed by the commercial university senate for a period of two years. His duties are chiefly confined to the supervision of the daily school work. He is required, before the beginning of every school term, to communicate with the different professors whose lectures are included in the term's work to remedy any conflict that may appear in the working schedule.

Admission is granted to students who can present a certificate setting forth that they have attended German schools for nine years, to teachers who have passed their second examination, to merchants who have their one year's voluntary military service papers, or who have finished their apprenticeship, if they can show in a satisfactory way to the board the necessary mental knowledge. In case foreigners ask for admission, the committee will decide whether or not they possess the proper educational qualifications. No person can be a student at the commercial school and at the University of Leipsic at the same time. Upon application for a visiting card, however, permission will be granted students of either institution to attend lectures in the other.

The course of study covers the science of law and political economy (as far as they are necessary and valuable for general education and for the commercial profession), commercial history, commercial geography, knowledge of goods, technology, and foreign languages. Commercial arithmetic, bookkeeping, correspondence, and stenography will also be taught. Those who desire to educate themselves as commercial school teachers will have an opportunity of attending pedagogical lectures at the seminarium, which is connected with the public commercial school.

The school term begins on the 23d of April and lasts until the end of July. The second term commences the 1st of October and finishes on the 1st of March. Just before the second term—i. e., the last week in September—the time is spent in visiting factories and mills to study the actual workings thereof.

Two years' time is required for the whole course.

The tuition fee is $10 per annum, which entitles the student to attend all the lectures of the course. For subjects other than prescribed in the regular course, such as foreign languages, an additional fee will be charged, which, however, will be very small.

The establishment of a state examination commission and the publication of detailed regulations concerning the examinations is reserved. Misconduct is punishable by fines as high as 50 marks ($11.90) and, in case of gross misconduct, by dismissal.

The following will be the faculty for the first two years:

Science of general political economy, Prof. Dr. Büchner; commercial and trade politics, Prof. Dr. Büchner; industrial politics, Dr. Pohle; commercial, maritime, and banking laws, Prof. Dr. Friedberg; introduction into the studies of statistics, Professor Hasse; German colonial politics, Professor Hasse; geography and colonial politics of East German Africa, Dr. Hassert; general and chemical technol-

Digitized by Google

ogy, Dr. Rassaw; elementary insurance mathematics, with practical exercises, Dr. Hausdorff; countries and cities of central Europe, Prof. Dr. Ratzel; general history of modern times, Prof. Dr. Marks; introduction into the knowledge of plastic arts, Prof. Dr. Schmarsow; history of the German literature of the generation of Klopstock and Lessing, Professor Witkowsky; commercial and political arithmetic, Mr. Lambert; bookkeeping, Mr. Lambert; correspondence and office work, Dr. Döll; mechanical technology, textile industry, with excursions, Dr. Pritzch.

Lectures in foreign languages and exercises in commercial correspondence in foreign languages will be arranged as they may be needed.

B. H. WARNER, Jr., *Consul.*

LEIPSIC, *March 25, 1898.*

COMMERCIAL EDUCATION AT GERA, GERMANY.

Consul Warner sends the following from Leipsic, July 28, 1898:

Subsequent to writing my report upon the Leipsic Commercial University my attention was called to another very prominent technical institution.

The Amthor Higher Commercial School at Gera, Reuss, affords young men a most excellent opportunity for acquiring theoretical and practical knowledge of business and business methods. There are now 200 students, and the course of instruction is as follows:

The preparatory course comprises German, French, and English, with correspondence; history and geography (general and commercial), botany and zoology, and caligraphy and arithmetic.

The first commercial course embraces: German language, literature, and correspondence; French and English languages, and correspondence; arithmetic, bookkeeping, commercial science, history, and geography (general and commercial), higher mathematics, physics, caligraphy, and stenography.

The second and third courses take up the same subjects in a more advanced form. The length of each course is one year.

In response to a long-felt want a class has been added to the school course which affords apprentices of the mercantile calling an opportunity to perfect themselves in a theoretical way.

WEAVING SCHOOLS IN GERMANY.

Under date of August 3, Mr. Warner transmits the following report from Consular Agent Neuer, of Gera:

Continually increased attention is given in Germany to the question of technical and industrial education. The Government as well as mercantile corporations and municipalities are aiding this movement in every possible way. Schools are to be found in nearly every large trader-center, where the details entering into the manufacture of various classes of goods are taught, and the latest discoveries of science and practical experience are employed. Of this widely spread system of technical and industrial education the weaving school in Gera forms a branch. Wealthy manufacturers take a deep interest in the institute and have aided it from time to time by donations and bequests. Moreover, the institute is supported by subscriptions, the fees of the students, and an annuity of 2,000 marks ($476) granted by the Government. It has a principal and seven assistant teachers, who possess special qualifications and are skillful weavers themselves. The board of administration consists of five expert merchants, who watch over the school's progress, examine its work, and report to the city's association of manufacturers.

Digitized by Google

The pupils are partly young workmen and partly young merchants engaged in weaving mills, and are divided into four classes. The school is open twice a week; on Sundays from 7 or 8 to half-past 9 or 10 o'clock in the morning, and on Tuesdays or Thursdays from 8 to 9 o'clock in the evening, thus not interfering with the usual working hours of the students.

The course of study lasts four years, and instruction in the single classes comprises the following subjects:

Class 1.—Calculation and pattern designing; origin and development of weaving; mode of sorting and classifying the raw material; method of rating goods by ascertaining the quantity and price of material used, and also cost of labor required in the production of a given length and width of goods, or from given data of values of material and labor.

Class 2.—Weaving in its present state of perfection; weaving and designing of jacquards; nature and properties of the various kinds of wool.

Class 3.—Machine construction, with special regard to the power loom; comparative merits of power looms; consideration of the principal parts which are common to all power looms.

Class 4.—Construction of various kinds of hand looms; weaving by hand looms; technical designing; weaving of fancy articles, etc.

Theoretical instruction is given from various works on weaving, and from a large collection of designs and models. For practical instruction there are in use 13 power and 17 hand looms adapted to the weaving of various standard fabrics, besides other appliances for demonstrating the processes of preparation and of plain and fancy weaving.

A voluminous library connected with the school proves a most valuable factor in the promotion of technical knowledge.

An exhibition embracing woven articles, sketches, designs, and writings of the pupils on textiles, machine construction, etc., is held every year. The last exhibition, on March 27 of this year, was considered an extraordinary success, and showed the great interest taken by all classes of people in the institution.

On the other hand, it made evident the diligence and zeal which both teachers and scholars devote to their task in pursuance of one common object—the advancement of industrial and technical knowledge. Prizes were awarded on this occasion, consisting of books on designing and weaving, cases of mathematical instruments, diplomas, etc.

The fee to be paid monthly by each pupil amounts to only 50 pfennigs (12½ cents), hence enabling the working classes to share the benefits of the training.

I need not take up space in this report to call the attention of our manufacturers to the advantages derived from technical education, as these are already known and appreciated by many of our educators and manufacturers. My present purpose is simply to call attention to the means that are being applied to generalize and perfect the system of technical education in this country, in order that our people may be advised of the methods adopted to strengthen manufacturing industries.

EDUCATION IN RUSSIA.

During August this year the first special meeting of school directors was held in St. Petersburg. Invitations were sent to all the schools, both church and otherwise, for their members to take part in the conference. As far as can be gleaned from the somewhat scanty reports, the subjects considered were very interesting.

At one of the meetings it was particularly noticeable that no protests were heard to the effect that matters to be discussed should be dealt with by the clergy alone, as was the case in previous years, and it was generally agreed that only the

Digitized by Google

cooperative and friendly work of the ministry for national education and the clergy could give the people proper and thorough education. Provincial and county councils that before were considered incapacitated were this time specially invited to join in the work of the ecclesiastical party.

The head of the church schools at the first meeting announced that provincial and county councils desiring to assist the clergy in educating the people would always be met with assistance and consideration from the local and central church school establishments.

It was then agreed, with the exception of special cases, to admit as guardians over church schools members of another faith. The subject of increasing present resources was then fully discussed. The reporter stated that were it possible for the state exchequer to add in the course of eight years to the school budget 200,000 roubles ($100,000), in ten years it would be possible to open 80,000 properly organized schools, with 4,000,000 scholars, and 100,000 ungraded national and parochial schools, with 5,000,000 scholars.

To help increase the state budget, it was proposed to impose a 2 per cent levy on the revenues of all monasteries and churches (excepting those with special appointments), also on insured church capital, and on revenues derived from the manufacture of church candles. On several previous occasions funds were raised by the above plan.

Several other questions were touched upon, among them the matter of teachers, which was pointed out as of great importance.

From the above it is to be seen that at present great interest and activity are being centered on the matter of public education.

THOMAS SMITH, *Consul.*

MOSCOW, *September 30, 1898.*

SCHOOL FOR THE MERCHANT MARINE IN RUSSIA.

I transmit a translation of the regulations, established by imperial authority, for the management of an institution recently organized in this city, which has for its object the training of young men in the theory and practice of navigation, in order that they may become competent to take command as masters and mates on Russian merchant vessels.

The studies make of those who successfully pass the course highly educated men, familiar with the English, French, or German languages, physics, mathematics, theoretical mechanics, commerce, political economy, bookkeeping, physical geography, nautical astronomy, shipbuilding, commercial geography, law, hygiene, etc.

I have thought it advisable to bring the knowledge of this establishment to the attention of the Department at this particular time, for the reason that it would in my opinion be highly advantageous to our future commercial and merchant-marine interests if similar institutions could be successfully established throughout the United States, either in connection with educational institutions or as separate establishments.

As we shall furnish the world with food and manufactured goods, both patriotism and profit demand that these products be carried in American ships, and that these ships be manned and officered by competent Americans.

We move quickly in the United States, and it requires but a slight knowledge of our people to predict that in ten years' time we shall have the largest merchant fleet afloat.

I have been told by Americans who have traveled much in European and Asiatic waters that an American ship is rarely met with, and certainly my own experience as consul at Odessa during the past thirteen years confirms the statement.

Digitized by Google

I have never on a single occasion seen an American ship in the Odessa harbor, and yet during the year 1897 the official returns show that 1,192 steamers and 34 sailing vessels, having an aggregate tonnage of 1,761,339 registered tons, entered this harbor. Of these, 663 steamers, having a registered tonnage of 1,050,028 tons, were British.

Under the circumstances, it is not surprising that the Russian Government is now admitting ships for the Russian foreign and domestic trade free of duty, and is also establishing and endowing marine schools for its coming merchant-marine officers.

THOS. E. HEENAN, *Consul.*

ODESSA, *December 2, 1898.*

[Translation.]

STATUTES OF THE CLASSES OF MERCANTILE NAVIGATION AT THE ODESSA COMMERCIAL SCHOOL.

(1) The object of these classes of mercantile navigation at the Odessa Commercial School is to give to young men who are preparing themselves to perform the duties of ship masters and mates on board of trading merchant vessels a corresponding theoretical and practical education.

(2) The classes are under the care of the department of trade and manufacture of the ministry of finance.

(3) The revenue for the support of these classes consists of (*a*) sums given by the Government for their maintenance according to the statutes; (*b*) annual subsidies from the municipality of Odessa, out of the sums received from the tax levied on exports; (*c*) subsidies from steam navigation and from other companies, and (*d*) payments by students for their instruction.

Remark.—The sums received by virtue of *b* and *d* form the special means of revenue of the classes, and are disbursed for their maintenance in addition to the sums granted by statutes; so that the payment for the instruction is exclusively applied to such expenses in connection with the teaching as have not been provided for by the statutes.

(4) The course of instruction extends over three years, and is subdivided into three classes.

(5) In these classes will be taught: (*a*) Religion; (*b*) Russian language and literature; (*c*) English; (*d*) French or German; (*e*) physics; (*f*) mathematics (practical calculation, plane and spherical trigonometry); (*g*) theoretical mechanics; (*h*) commerce, with elementary particulars of political economy and bookkeeping; (*i*) physical geography (hydrology and meteorology); (*j*) navigation, with pilotage and fundamental particulars regarding deviation of compasses; (*k*) nautical astronomy; (*l*) fundamental principles regarding the construction of a ship; (*m*) practical seagoing; (*n*) steamship mechanics; (*o*) commercial geography; (*p*) knowledge of cargo; (*q*) law, and (*r*) hygiene.

Remark.—The subjects enumerated in *g*–*r*, as well as spherical trigonometry, are considered special; the remainder relate to general instruction.

(6) During the course of education, in addition to theoretical teaching, practical instruction takes place on vessels. The superintendence of this instruction is intrusted to the captain of the training ship.

(7) Students of all conditions and religions, who are Russian subjects, are received into these classes.

(8) For admission into the classes is required: (*a*) The presentation of a certificate showing that the applicant has passed through the general course of education given in the commercial schools of the ministry of finance, and must pass an examination in the English language and in mathematics, to the extent of the course of instruction as given in the general classes of the Odessa Commercial School, and (*b*) the accomplishment of a trial voyage of not less than two months on board of the training ship belonging to the classes.

Remark.—Those who do not present certificates as mentioned in *a* are subjected to an examination to the extent of the course of instruction as given in the general classes of the Odessa Commercial School—in all subjects excepting chemistry. Those who have passed through five classes of a regular school or of a classical gymnasium are accepted after passing an examination—the first named in mathematics and in the English language, and in the French or German language to the

Digitized by Google

extent of the course of instruction as given in the general classes of the Odessa Commercial School, and the last named, in addition to this, in physics.

(9) In connection with these classes of mercantile navigation, there may be established, with the consent of the ministry of finance, a boarding and lodging house for the students at the expense of such students, or on special donations for that purpose, or on the joint revenue derived from these sources.

(10) The general management of the classes of mercantile navigation is vested in the council of wardens of the Odessa Commercial School; the immediate management of the same is intrusted by them to the manager of the classes.

(11) For the purpose of participation in the discussion of matters concerning the classes of mercantile navigation, in addition to the council of wardens of the Odessa Commercial School, are added as members (*a*) the manager of the classes; (*b*) a representative from the Odessa municipality, and (*c*) representatives of the steam navigation companies and of those institutions which subsidize the classes, appointed in rotation and to the number prescribed by the minister of finance.

(12) The manager of the classes must accompany the students during the time they are pursuing their practical studies on the training ship at sea, for the purpose of watching their progress and morality, as well as for the immediate supervision of their practical studies in steersmanship. The manager of the classes may also be charged in accordance with instructions from the council of wardens, with the command of the training ship; but in that case the immediate guidance and supervision of the practical studies of the students must be intrusted to one of the teachers or to one of the captain's assistants (mates), who is selected by the manager of the classes with the consent of the council of wardens.

(13) As assistant to the manager of the classes in the execution of the duties of inspector and in the supervision of the students, one of the teachers is appointed with the title of instructor. In the event of the illness of the manager of the classes, the instructor takes his place.

(14) The subjects of instruction in these classes of mercantile navigation are distributed among the staff of teachers who are in the Government service and those who are only engaged temporarily. The number of the first named must not exceed six, and they can only be on the following subjects and groups of subjects: (*a*) Mathematics (practical calculations, plane and spherical trigonometry) and physics; (*b*) navigation and pilotage and fundamental particulars regarding the deviation of compasses; (*c*) nautical astronomy; (*d*) theoretical mechanics and fundamental knowledge of the theory and construction of a ship; (*e*) steamship mechanics, with other practical studies, and (*f*) English language.

Remark.—The manager of the classes of mercantile navigation, if he so desires, may instruct in one or more subjects of the course, but not more than eight hours a week.

(15) The manager of the classes, as well as the captain of the training ship, is appointed by the council of wardens from among persons who have received a special naval education and who have served either in vessels of the imperial navy or in the merchant marine.

(16) The manager of the classes, as long as he occupies that office, is reckoned as being in the fifth rank, and is confirmed in that rank after serving in the same for nine years. He may, however, be raised to that rank or grade before the expiration of that term by virtue of the general rules established for the civil service.

(17) The instructor and teachers are chosen by the manager of the classes after consultation with the council of wardens and are confirmed in their positions by the department of trade and manufactures.

(18) The teacher of religion is selected by the manager of the classes and, after receiving the recommendation of the council of wardens, is confirmed in his position by the department of trade and manufactures, with the consent of the administration of the archdiocese.

(19) As teachers of the subjects of general instruction, such persons may be appointed whose education and training qualify them for positions in regular schools.

(20) Teachers of the special subjects, other than those relating specially to naval matters, are appointed from among persons who have finished the course of study in the highest educational establishments and have received from the department of trade and manufactures certificates granting the right to teach these subjects in the commercial schools. Teachers of nautical subjects must have passed through the naval-cadet corps of the technical school of the marine department or have taught in mariners' schools of the higher grade for not less than five years. Persons who can not qualify under these conditions may be admitted to act as teachers after reading three trial lectures in the presence of a special committee appointed

Digitized by Google

by the schools committee. Those who are successful are confirmed in their positions by the department of trade and manufactures after the expiration of one year.

(21) For instruction in the special subjects, payment is fixed at 150 rubles ($75) per annum, and in subjects of general education 75 rubles for a weekly lesson. The rate of payment to the teachers may be three times increased by one-fifth, but not previous to the expiration of three separate periods of five years each and on the condition that the highest rate be allowed only to two teachers.

(22) Students who have passed the full theoretical course of the classes of mercantile navigation and who have taken two practical courses are submitted to an examination, according to the programme confirmed by the ministry of finance, before a special committee, under the presidency of a person annually appointed by the minister of finance, composed as follows: The manager of the classes, the director of the commercial school, the teacher of that subject in which the examination takes place, the captain of the training ship (in the subjects of nautical specialty), a representative of the department of marine, a representative from the municipality of Odessa, a representative from the body of merchants elected by the exchange committee, and one member of the council of wardens elected by that council from the persons described in *c*, paragraph 11.

(23) After passing examinations in the theoretical course of instruction, the teachers must pursue a course of practical navigation for about three months in vessels of the merchant navy and about two months in the training ship of the classes, after which they are submitted to an examination in practical knowledge by a committee, comprising the persons named in the preceding paragraph, with the difference, however, that in matters of practical knowledge the presence of the director of the commercial school is not obligatory.

(24) Students who have successfully finished the examination in the theoretical and practical courses, provided that the aggregate duration of their training in navigation (together with experimental navigation, navigation on board commercial steamers, and the time of practical examinations) amounts to no less than seventeen months, receive a certificate that they have finished the course of education. The best students are rewarded with gold and silver medals. As regards their entering the Government service on duties which demand technical commercial knowledge, and also into higher educational establishments, those who have finished the full course of the classes of mercantile navigation enjoy the rights granted to those who have finished the course of regular schools. With regard to the acquisition of the rank of steersmen (mates) or masters of merchant vessels, they are subject to the regulations existing for that purpose. (Paragraphs 193–204 of Commercial Code; Code of Law, Vol. XI, Part II, edition 1893.)

Remark.—Students who have successfully passed the examination in the theoretical course, but who were unable to complete their sea service on account of illness, will be granted all the rights enumerated in the preceding paragraph; but, in lieu of an attestation of having passed the full course, they will be given certificates of having passed the said examination, with a statement regarding the causes that prevented their finishing the practical course.

(25) As regards military service, the students who have finished the course enjoy the privileges granted to students of the first category of educational establishments. Those who have not finished the course have the privileges of those who have passed the course in the establishments of the second category. The commencement of military service in the army is postponed for students until the age of 24 years; and those students who, after having finished the course, desire to acquire the rank of mate or of master may be granted, with the consent of the ministers of finance and war, the time necessary for this object.

(26) The classes of mercantile navigation at the Odessa Commercial School are authorized (*a*) to have a seal of the pattern established for the provincial institutions; (*b*) to acquire real estate and to accept all kinds of donations; (*c*) to order from abroad objects and apparatus required in teaching, with the observance of paragraphs 1047 and 1048 of the Customs Code (General Law Code, Paragraph XI, edition 1892), and (*d*) to send their mails, parcels, and packages up to 1 pood (36 pounds) weight without payment of postage.

Staff of the classes of mercantile navigation attached to the Odessa Commercial School.

Description.	Number of persons.	Annual emoluments.								Class or category.		
		Salary.		Allowance.		House rent.		Total.		Of service.	Of uniform.	As regards pension.
		Rubles.		*Rubles.*		*Rubles.*		*Rubles.*				
The manager of the classes	1	1,200	$618	1,200	$618			2,400	$1,236	V	V	The same as for public instructors.
The manager for five months' allowance while at sea.								800	412			
Teachers on the staff	6									VIII	VIII	
Additional remuneration to the teacher on the staff who fills the post of instructor.								600	309			
Clerk	1	500	257					500	257	IX	IX	VII.
Surgeon	1	400	206					400	206	VIII	VIII	As in medical service.
Surgeon's allowance for five months at sea								460	236			
Remuneration of teachers according to number annual hours of class occupation.								10,425	5,366			
Remuneration of teachers for sundry extra services.								3,100	1,596			
For schoolbooks, etc., and for addition to library								2,000	1,030			
For the captain of the training ship	1	950	489	800	412	250	$128	2,000	1,030	VI	VI	As for public instructors.
Captain's allowance for five months at sea								1,200	618			
First assistant to the captain	1							1,600	824			
First assistant's sea allowance (five months)	1							200	103			
Common seamen on training ship, barge, or steam cutter.	6							2,340	1,205			
Wages of second and third mates for six months' navigation.	2							1,050	540			
Their seagoing allowance for five months								400	206			
For wages of common seamen and servants while at sea.	9							1,275	656			

REMARKS.—The seagoing allowance and the board wages, appropriated by virtue of these statutes to certain offices, are given to persons occupying those offices only for the time of their actual participation in the navigation of the training ship.

(2) Should the manager of the classes be charged with the command of the training ship, he will then receive the allowance which has been appropriated to the office of the captain of said vessel; the seagoing allowance appropriated to the office of the manager is in that event given to the person who will be charged with the immediate supervision of the practical studies of the students in steersmanship and navigation.

(3) Should any person be appointed to the office of captain of the training ship who has previously been in the service as first mate on that vessel during the course of no less than ten years continuously, then all this time is included in the term of service for the pension for public instruction in connection with the office of captain, on the condition, however, that he pays into the State exchequer's branch office 2 per cent of the entire remuneration received by him for the said period.

(4) Pensions are apportioned to the manager of the classes according to the rate of salary given to him, and to the captain of the training ship and the teachers on the staff at the rate of 750 rubles ($386).

(5) Surplus over the sums allotted by these statutes for the remuneration of teachers and for the schoolbooks, etc., may not be diverted so as to cover deficits under other paragraphs.

SUPPLEMENTARY EDUCATION IN SAXONY.

In the following report I have tried to explain the work of the further-developing, or supplementary schools, in Saxony and to impress upon our educators the importance of this branch of training. The supplementary schools are for the people who have to work what Chautauquas, summer schools, and university extensions are for others. These supplementary schools in Germany are quite old, and antedate such efforts in America. I believe they suggested the latter. In 1873 Saxony's supplementary schools were put under a law compelling attendance. Before that they had had the precarious existence that attends efforts of individuals independent of the State and lacking power to enforce compliance with their rules. Some had been so successful that the State, seeing how well suited they were to extend useful knowledge, adopted them into the state system. At first they found both opposition and favor. Parents and children opposed them bitterly, the former because they had been wont to do what they pleased with their children after they left school at 14 years of age, the latter because they were kept for two years longer under restraints that had already grown irksome. Even the towns and communities complained, believing the results would not be worth the expenditure. Petition after petition went up to Dresden begging the government to abolish them. These were not only refused, but the importance of such schools was pointed out to the petitioners, until they too became convinced. In 1881 a new plan or course of studies was prescribed for these schools which proved very successful. In recent years advocates of the schools are asking to have branch schools opened to girls. Hitherto they have been mostly for boys. From the annual report for 1897 it will be seen that with a population of 3,783,014, Saxony had 1,953 of these supplementary schools, with 75,358 boys and 1,699 girls in attendance. Besides these, there were 39 industrial schools, with 10,660 scholars; 112 industrial technical schools, with 10,119 scholars; 44 commercial schools, with 4,781 scholars; 11 agricultural schools, with 691 scholars; 7 schools for all kinds of work for girls, with 1,596 scholars, and 18 technical schools for girls, with 2,445 scholars, or a total of 2,170 advanced special schools, with 107,376 scholars. To every 1,743 inhabitants Saxony had one such school. The best results were recorded in those schools where scholars were arranged in classes and where instruction is followed by practical work in the trade or calling followed by the pupil. This has been possible in all the larger towns, villages, and cities. In order to help the small so-called home industries to compete with the big capitalists, a large number of industrial, industrial-art, and technical schools have been established and provided with suitable buildings. These have had State aid and assistance from industrial unions, town governments, and societies. Besides these schools, the State has supported others for helping handworkers and industrial laborers. The technical schools that aid industrial laborers to continue or to complete their theoretical, technical, and artistic education have often helped to increase and advance the cities in which they are situated. From 1,000 scholars in such schools in 1874 the number has gone up to 30,335. Proud, too, is Saxony of her agricultural schools. They have helped beyond what their most sanguine advocates believed possible. Important information, gained only after years of hard labor on the farm, is put before boys just out of the common school in such practical form as to fix itself in their memories forever. The profitable progress of farming, not only in Saxony, but all over the Empire, bears eloquent witness to the wisdom of these schools. In 1897 Saxony had 8 agricultural schools, with 565 scholars. Of the 44 commercial schools, 4 have high-school branches, opened in the middle of this century, and Saxony's wonderful wealth, her industrial greatness, and the fact that she sends out to other parts of the world millions upon millions of dollars' worth of all kinds of merchandise, toys, textiles, tools, and machines is a proof of their excellence. The diversity of her products is limited only by the demands

Digitized by Google

of markets. To England alone in 1896 she sent textiles amounting to $25,000,000. To us she sends as much, or nearly so.

Of the 34 commercial apprentice schools established and supported by merchant corporations, 20 were established during the last twenty-five years. It is a mistake to say Germany's industrial, industrial art, and technical school system is old. No part of it antedates one hundred years. Under the ægis of its far-reaching system of education, especially of such special schools as have been mentioned, its support of all that aids or advances the intelligence and well being of its industrial and laboring classes, its industrial art, commerce, and transportation, Saxony cherishes the hope that its good name, as the nursery of art, industry, commerce, manufactures, etc., will continue to grow in the coming as in the past years.

I may still further supplement all the foregoing by pointing out more particularly what purposes the supplementary schools are intended to serve. Parties in politico-economic circles here found that the system of common-school education under which boys and girls were given an ordinary education in reading, writing, arithmetic, etc., up to their fourteenth year, was inadequate, partially if not wholly, to the ends aimed at in such a system. To supply this defect it was urged, and finally proposed and favorably acted upon, that graduates of the common schools, boys especially, in some few cases girls, too, should continue to get instruction a certain number of hours a week. This was made compulsory. Manufacturers, shopkeepers, and mechanics in whose employ such boys were found, and not the parents, were made responsible for the boys' attendance. In these schools, as indicated in the foregoing, the boys get as good an idea as possible of the trade or branch of business in which they are employed. As a rule, the hours of attendance are early in the morning or a certain number of afternoons in the week. Sunday mornings are not thought too sacred for this work. It seems to be an acknowledgment that the years hitherto given to a boy in which to get an education, viz, from his sixth to his fourteenth year, is not enough to prepare him for the struggle for life that he has to enter upon. Men have told me, successful merchants and agents here, that they owe more to the hours spent in the developing or supplementary schools, from the practical character of the instruction given and the information imparted, than to the many years spent in the common schools. While one is hardly willing to believe this, there can be no doubt of the good work done and being done by the schools referred to.

MONAGHAN, *United States Consul.*

CHEMNITZ, SAXONY, *August 31, 1898.*

GERMAN STUDIES OF MALARIAL DISEASE.

The German Colonial Society, one of the most important of several permanent associations at Berlin which are devoted in one way or another to the systematic development of Germany's colonial possessions and the foreign trade of the Empire, has taken up with great energy the suggestions of Professor Koch as to the necessity of more effective measures for studying and mastering the malarial diseases which now so seriously restrict the settlement and impair the value of the colonies in Africa and the East, which have been acquired and maintained at such cost of effort and outlay.

It is recognized that public hygiene, among the climatic conditions which exist in tropical countries, presents difficulties for which special preparation and provision must be made. Medical officers who are sent out for service in such countries must have a special scientific training in the diagnosis, treatment, and prophylaxis of malarial disease. This has now been provided for by a special course of study at the Institute for Infectious Diseases, of which Professor Koch

Digitized by Google

is the technical chief; and a number of young physicians who are preparing for colonial service are already at work under the direction of the great bacteriologist. When their special studies are finished, these physicians will go to their posts of duty in the colonies, each provided with a special outfit of scientific apparatus devised by Professor Koch, and will be thus equipped to take up and continue the observation, record, and study of malarial diseases, upon the result of which so much of the future value of Germany's tropical colonies will depend.

Besides these preparations for prolonged and systematic observation, Professor Koch has appealed to the Prussian ministry of medical affairs, to which he is officially subordinate, for two further scientific expeditions, to be organized and conducted under his personal direction, for the purpose of completing thoroughly the preliminary studies which he has made in Italy, Africa, and India. According to the announced plan, one of these commissions will be limited to three months, and be assigned to the study of malaria in Greece and Italy, in which countries the climatic conditions are to some extent influenced by bad drainage and insanitary habits of the people in old and badly constructed cities.

The second expedition is to occupy two years and make an exhaustive study of malaria at the deadliest fever districts of New Guinea, East Africa, and India. The keen interest manifested in this whole subject by the Prussian ministry and imperial foreign office, and the wide attention that has been attracted by Professor Koch's reports of his preliminary studies of malaria in tropical countries, encourage the belief that both the proposed expeditions will be authorized and their respective missions carried out in accordance with Dr. Koch's specifications.

He has recently left Rome, after six weeks of study in the hospitals where are treated cases of Roman and Campagna fevers, and in which he has been aided by the foremost specialists of Italy. As a result of these studies, it is now declared that the malarial fevers of Italy are identical in cause and general character with those of East Africa, and it is believed that science is on the eve of a decisive victory over this whole group of maladies by means of liquid injections of quinine into the pulse vein. The importance of this discovery to Italy will be evident from the fact that of the 69 departments into which that Kingdom is divided, only 6 are absolutely free from malaria, and 1,200 square miles, including some of the most fertile districts of Italy, are, like the whole southeastern coast of Corsica and much of Sardinia, practically uninhabitable on account of malarial disease.

Among the other interesting deductions of Professor Koch is his freely expressed opinion that the indiscriminate use of quinine as a prophylactic in malarial countries is attended with great danger, and is in many cases the indirect cause of the pernicious "black-water" fever, one of the most virulent forms of malarial disease. The very general practice among persons coming from temperate to tropical latitudes of saturating their systems with quinine, taken in regular and often excessive doses, is vigorously condemned for two reasons: First, because it seriously weakens the action of the heart; and, second, because the system, having become inured to the drug, fails to respond to quinine treatment in case of actual sickness.

The efficiency of the drug having been exhausted as a preventive, it has no longer any important value as a remedy; and experience shows that a person debilitated by the excessive use of quinine may take malarial fever and die of it like anyone else. Professor Koch even goes so far as to assert that the increased death rate in certain portions of West Africa, where the conditions of living have been greatly improved during the past ten years, is due largely to the increased and indiscriminate use of quinine caused by its greater cheapness and the ease with which it can now be obtained. He also states that on the western coast of Africa, where all forms of malarial fever are especially virulent, cases of the intermittent type which have resisted even heroic doses of quinine have been mastered by the use of arsenic. It is well, however, to remember in this connection that a certain

Digitized by Google

antipathy to quinine and a preference for arsenic as a remedy for certain fevers is a marked and well-known peculiarity of the German school of medicine, in respect to which its opinions are in sharp disagreement with those of physicians in some other countries, notably the United States.

Another fact noticed and mentioned by Professor Koch during his studies in Africa and India is that women withstand exposure to malarial climates far better than men. During the appalling mortality on the Gold Coast within the past four years, says the report, there was hardly a death among the women living out there, while every kind of man was dying—men new to the Tropics, men born in them, men who had been accustomed to them for years, even men who had battled with the ravages of West Africa for upward of ten years.

The attempt to explain this anomaly by the fact that men are, as a rule, more exposed to the hot sun of day and the miasma of night, failed in presence of the fact that the death rate was highest among officials, merchants, and employees who work in offices, banks, and warehouses, where no exposure to weather is involved and where medical attendance, food, and all conditions of living are the best obtainable in that country. The fact that black-water fever, so deadly to male Europeans, almost never attacked women, and that no physician has yet offered any reasonably conclusive explanation of such discrimination, illustrates how far medical science is yet from a full understanding of malarial disease and how long and difficult a road is yet to be traversed before the risks incurred by northern civilization in the effort to reclaim and civilize the Tropics will be reduced, through exact knowledge and scientific practice, to a minimum.

The subject is certainly so important as to invest with world-wide interest the efforts that Germany is now making under the lead of her foremost bacteriologist to reach a clear understanding of, and more potent mastery over, the scourge which now makes desert some of the fairest and most fertile portions of the earth.

FRANK H. MASON, *Consul-General.*

FRANKFORT, *October 11, 1898.*

PRACTICE OF PROFESSIONS IN JAPAN.

Consul-General Gowey sends from Yokohama, under date of December 21, 1898, a summary translation of the laws of Japan relative to the practice of the professions of law, veterinary surgery, medicine, and dentistry, together with a list of schools devoted to these subjects.

LAWYERS.

Anyone who desires to practice law must pass the examination, which is to be held once a year, and must obtain the permission of the minister of state for justice, and then he can practice in the supreme court and other courts. A minor, a bankrupt who has not completed the obligation of compensation, a person convicted of a theft or fraud, an official, or a public or private employee, is debarred from obtaining such permission. A practitioner must join a guild of lawyers where he chooses to locate, and observe its rules and regulations. The registration fee is 20 yen ($9.96) and the sum of 10 yen ($4.98) is to be paid as a fee at the time of examination. Violation of the provisions to be observed by the members of the bar is punishable by censure, by suspension of avocation for not more than one year, or by a fine of not more than 100 yen ($49.80, or by "jornei," in which case the lawyer's name is expunged from the register, and he is not entitled to continue the profession until three years have elapsed, or is disbarred for life, according to the gravity of his offense. In the case of a graduate of the law college of the Imperial University he is exempted from passing the examination, but is required only to apply for a license for practicing.

Digitized by Google

VETERINARY SURGEONS.

This profession can be followed only by one who has obtained license from the minister of state for agriculture and commerce.

The following persons may obtain the license: One who has passed a veterinary examination and holds a certificate; one who holds a diploma of a governmental veterinary school or a certificate that he has passed a special course of the veterinary department of an agricultural college; one who holds a certificate that he has passed a special course of the veterinary department in a public or private school the curriculum of which has had the approval of the minister of state for agriculture and commerce; one who holds a graduation certificate of a governmental or public veterinary school in a foreign country.

A license fee of 1 yen (49.8 cents) must be paid. A renewal of license on account of loss can be made upon the payment of 50 sen (24 cents).

A suspension of business for not less than five days and not more than fifty days, or entire prohibition of occupation, may be adjudged, if there be any offense with regard to veterinary practice or improper conduct, by the minister of state for agriculture and commerce, according to the circumstances of the case. This prohibition may be rescinded after three years have elapsed if deemed advisable, in which case the practitioner must apply for a fresh license.

A fine of not less than 5 yen ($2.49) nor more than 50 yen ($24.90) will be imposed upon one who has practiced veterinary medicine or surgery without obtaining a license. A fine of not less than 2 yen (98 cents) nor more than 25 yen ($12.25) will be imposed upon one who follows the business while he is under suspension.

A penalty of not less than 1 yen nor more than 1.95 yen will be imposed upon a veterinary surgeon who shall have refused to comply with the request of others for professional services without proper reasons therefor.

The minister of state for agriculture and commerce may issue a provisional license to a person who has none of the qualifications enumerated above, but whose antecedents merit such favor, by limiting the area of operation and the period of practice, upon the recommendation of the chief of the Hokkaido Cleo or by a governor of any prefecture where veterinary surgeons are scarce.

MEDICINE.

Any person who desires to practice medicine must pass an examination before a committee annually appointed by the minister of state for home affairs. The fee for a license to practice is 20 yen ($9.96). The alumni of the medical college of the Tokyo Imperial University and of the medical departments of the first, second, third, fourth, and fifth high schools and one of the medical schools of Osaka, Kioto, and Aichi are entitled to practice without passing the examination, the only requirement being to apply for and obtain license.

A physician who shall have committed an offense, or one who has been guilty of improper conduct in a professional way, may be suspended or prohibited from practice by the minister of state for home affairs after full inquiry has been made by the central sanitary board.

DENTISTRY.

After study of at least two years, one who desires to practice dentistry can apply for examination, which is held annually. This must be passed before he can procure a license, the fee therefor being 8 yen ($3.98).

The penalty clause that applies to physicians is also enforced in the case of dentists.

PHARMACY.

One must be over 20 years of age, pass the examination, and obtain license from the minister of state for home affairs before he can practice pharmacy. The

Digitized by Google

license fee for practicing is 3 yen ($1.49). He can prepare medicine only in accordance with a prescription of a physician, in which the name of the patient, age, name of medicine, quantity, directions for use, quantity to be taken by the patient, date, and name of the physician are described. A prescription for a poisonous or astringent medicine must be signed by a druggist and be kept for a period of ten years. One who practices the business of pharmacist without obtaining governmental sanction will be punished by a fine of not less than 10 yen ($4.98) nor more than 100 yen.

CHAPTER XXXV.

LEGAL PROVISIONS OF THE VARIOUS STATES RELATING TO TEACHERS' EXAMINATIONS AND CERTIFICATES.[1]

[The digest of the laws regulating the administration, character, and finances of the public-school systems of the States of the Union, Report of the Commissioner of Education, 1893–94, pp. 1063–1300, covers legislation as to teachers to that year, though not in a separate form.]

In the early history of public education in this country there were general requirements for moral and scholarly qualities in those employed to teach, but the tests of such qualities were left almost wholly to authorities immediately interested in the school to be taught. In New England, where the town formed the administrative unit for local affairs, the selectmen or the school committees were to be satisfied of the fitness of the teacher. In the advance of public education schools were established for the training of teachers, the initiation of which is claimed to have been in Massachusetts in 1839. The conditions as to satisfying the local authorities have not essentially changed in Massachusetts since professional schools were opened, though such authorities may accept the diplomas of normal schools as satisfactory evidence of qualification if they choose. Further details occur under Massachusetts, on a later page.

In New York as early as 1843 the State superintendent of public instruction was authorized to issue certificates, valid till revoked, as evidence that the holders were well qualified to teach any common school in the State. These certificates at first appear to have been issued "on such evidence as may be satisfactory to him."[2] In later years it became lawful and customary to issue such certificates upon the recommendation of local superintendents and school commissioners.[3] A normal school was opened at Albany December 18, 1844. In 1849 it was enacted that a diploma from the State normal school entitled the possessor to be deemed a qualified teacher anywhere in the State.[4]

Here might be a claim for something like a recognition of a professional standing for a teacher, but the exemption from local examination was not secured by the possession of a State certificate.[5] This decision affects the precedence which might have been claimed for New York in the recognition of teaching as a profession. The present professional standing in that State appears on a later page under New York.

The reciprocal influence of the United States and Canada has been considerable, and especially between the English-speaking province of Upper Canada, now called Ontario, and the adjacent portions of the United States. Upper Canada in 1844 took a step resulting in the establishment of a normal school in 1846, and an eclectic school system in 1850, avowedly modeled in its machinery or law from New York; in the principle of support (free to all and maintained by taxation), adjusted to a local option, from Massachusetts; in text-books, from the national

Digitized by Google

board of education of Ireland; in normal schools, from Germany. The Province has a land survey similar to that in the States formed from the public domain, and its town municipalities have a resemblance to those of the United States where the town of New England has been modified in connection with the national land survey. The example of Upper Canada had such a direct influence in certain States that a brief outline of the professional standing of teachers in that Province is desirable at this point.

The law of 1850 provided for three grades of certificates from county boards of instruction—the first, upon examination in mensuration, elements of surveying, algebra, geometry, general history, vegetable and animal physiology, school management, and improved modes of teaching, was valid throughout the county till revoked; the second, upon examination in common English branches and some knowledge of school organization and classification of pupils, was valid throughout the township till revoked; the third, upon examination kindred to the second, but less rigid, was valid in the school section, a division of the township corresponding to the school district of some States, for one year.

Provision was also made for provincial certificates, as follows:

And be it enacted, That it may, and shall, be lawful for the chief superintendent of schools, on the recommendation of the teachers in the normal school, to give to any teacher of common schools a certificate of qualification, which shall be valid in any part of Upper Canada until revoked according to law, provided, always, that no such certificate shall be given to any person who shall not have been a student in the normal school.[1]

Certificates issued under the above provision were of three classes, corresponding to those already named for local certificates. The first and second classes were valid till revoked, the third class for one year. The first issue was made June 18, 1853; 16 first class, 29 second class, 27 third class. A similar issue was made at the end of the next half year.[2]

In 1857 Hon. Egerton Ryerson, chief superintendent of schools for Upper Canada, wrote: "I may observe that certificates given by me as provided * * * are valid throughout Upper Canada, the same as a license of a physician."[3]

In June, 1854, Pennsylvania had the first election of county superintendents, which was by the township directors. In May, 1857, a general law was passed for the benefit of normal schools.

The tendency and aim in Pennsylvania is to make teaching an independent and honorable profession. * * * The normal school act, by the course and direction of the term of study, the probation to which its professional graduates are subjected and its two classes of State certificates, recognizes this object. * * * The distinction between the acquisition of knowledge and the ability to impart it to others is carefully preserved by requiring not only a theoretical knowledge of the art of teaching and practice in the model school, but two full annual terms of successful teaching in the common schools before the teacher's full certificate or diploma can be obtained.[4]

At that time county superintendents issued certificates similar to those now used, except that the professional certificate was often permanent without further care on the part of the teacher. The general provisions for two classes of county certificates and two classes of State certificates have been maintained, as may be seen under Pennsylvania on a later page.

A State normal school was opened in Illinois October 5, 1857. At the meeting of the State Teachers' Association in December of the same year the forms of diplomas used in Upper Canada were exhibited and a committee was appointed to report upon professional certificates. The report was presented at the meeting

Digitized by Google

of 1858. In 1861 the legislature authorized the State superintendent of public instruction to issue certificates of eminent qualifications upon examination by himself or others whom he should appoint, to be of perpetual validity in every school district in the State. The first examination was held July 2, 3, 1861, and five candidates received certificates. Under rules of the superintendent diplomas of State normal schools, with adequate experience, were acceptable in place of a written examination.

A later law makes it obligatory upon local boards to hold supplementary examinations, placing the professional license, like that of the New York State license, under the decision of the State superintendent in 1864, already cited. This is more fully shown on a later page, under Illinois.

In Wisconsin the subject of professional certificates was discussed from time to time—as, for example, at the State Teachers' Association in 1857. In his report, as State superintendent of public instruction for the year ending August 31, 1862, Hon. J. L. Pickard said:

> Until I had witnessed the workings of the system of State certificates in the State of Illinois I had many doubts as to its expediency. The results manifest in Illinois have removed all my objections and have encouraged me to urge its adoption in this State.

In 1868 a law was passed authorizing the issue of State certificates to teachers of eminent qualifications upon examination by a board of three competent persons appointed by the superintendent and acting under rules prescribed by him. The first examination was held August 12–14, 1868. Three candidates were examined, of whom two received certificates.

In West Virginia, by a law of 1863, "in order to afford encouragement and incentive to teachers to perfect themselves in their profession," county superintendents were required, on examination, to issue certificates of five grades, valid in the county for one year. When any teacher had received three No. 1 certificates he was entitled to a recommendation from the county superintendent to the State superintendent, who, upon examination, would "grant him a professional certificate in proper form, engraved upon parchment, * * * by which certificate the bearer shall be held to be legally admitted to the profession of teacher within the State of West Virginia, which certificate shall be valid throughout the State and during the life of the bearer thereof," revocable for immorality or disloyalty clearly proven. In 1873 the diploma of the State Normal School was legalized as a certificate of qualifications to teach common schools throughout the State till revoked by the State superintendent, and provision was made for life certificates upon examination by a State board of examiners. In 1881 the legislature annulled all State certificates and provided for the issue, upon examination, of county certificates, good for four years. Considerable complaint was made of the provision requiring all persons, whether heretofore exempted or not, to pass the annual county examination before they should be employed as teachers in the public schools.[1]

By the law of 1887 provision was made for limited State certificates, essentially as now issued and shown later under West Virginia.

California, by a law of 1863, had provision for limited State certificates or diplomas, the longest term being six years. By a law of 1873 provision was made for life diplomas, essentially as now provided and shown later under California.

By 1873 the discussion of a professional license had become general, and various States recognized the demand. The present conditions in each State are shown below. In all cases some license, local or otherwise, is necessary to draw public money, excepting a few instances where teachers of special subjects are not required to be examined.

[1] Editorial, West Virginia School Journal, March, 1882, p. 19.

Digitized by Google

To save many repetitions, it may be stated that testimonials of good moral character are universally required; where experience in teaching is prerequisite, it is successful teaching; "temperance," among subjects for examination, means "physiology and hygiene, with special reference to the effects of alcoholic drinks, stimulants, and narcotics upon the human system," or a like requirement, unless otherwise explained; "elected" indicates chosen by the people; "common English branches" indicates the general group—orthography, reading, writing, arithmetic, English grammar, geography, history of the United States.

The year against each State indicates the latest edition of the law accessible when the synopsis was made.

To indicate the professional relation of State and county superintendents, the manner of their selection has been inserted when clearly shown in the law.

In many States special charters give cities, towns, or independent districts control over their own schools, occasionally with full power over the local licensing of teachers without exemption for county or State licenses.[1] The conditions vary with individual charters, and therefore can have little notice here beyond the general mention. More special charters have been given for school purposes exclusively than for general purposes. As a rule, counties are subdivisions of the State and cities are subdivisions of counties, each lesser unit continuing to pay taxes and be otherwise subordinate to the greater. Four great cities have become coterminous with counties: New York, Philadelphia, New Orleans, and San Francisco, as also, practically, Washington, D. C. The cities of Baltimore[2] and St. Louis[3] have been detached from counties, and the cities of Virginia[4] are as independent of counties, except in details expressly defined in individual charters, as one county is of another.

In general, unless otherwise stated, licenses are valid for the town, county, or State of the authority issuing them.

The subject of education for the most part is left to State and local authorities, the National Government exercising little authority over details in the States.

UNITED STATES.—No certificate shall be granted to any person to teach in the public schools of the District of Columbia or Territories * * * who has not passed a satisfactory examination in physiology and hygiene, with special reference to the nature and the effects of alcoholic drinks and other narcotics upon the human system.[5]

ALABAMA, 1895.—Graduates of the State normal schools holding diplomas signed by the State superintendent are exempt from examination or fee and, by the law establishing normal schools, are entitled to teach anywhere in the State without further examination.

An educational board, consisting of the county superintendent, elected in certain counties, appointed by the State superintendent in others, and two teachers appointed by him (county superintendent), examines candidates.

There are three grades of county certificates: First, examination same as following, with higher algebra, natural philosophy, geometry, theory and practice of teaching; valid three years. Second, examination same as following, with practical arithmetic, history of the United States, English grammar, intermediate geography, elementary algebra; valid two years. Third, examination in orthography, reading, penmanship, practical arithmetic through fractions, primary geography, temperance; valid one year.

[1] The term "license," occasionally used in a law as a technical term, in general means any diploma or certificate testifying to a teacher's legal standing.

Digitized by Google

Fee, $1, to be divided between the appointive members of the board.

A diploma from any chartered institution of learning entitles the holder to a license without examination on payment of the fee.

Licenses are canceled whenever it appears to the board that the holders have been guilty of intemperance or unworthy or disgraceful conduct.

ARIZONA, 1897.—The Territorial board of education, consisting of the governor, treasurer, superintendent of public instruction, principal of the Territorial normal school, and chancellor of the University of Arizona, grants educational diplomas, valid six years, and life diplomas and revokes the same for immoral conduct or evident unfitness for teaching. It grants first-grade Territorial certificates to graduates of universities and chartered colleges of a similar rank when in its judgment deemed advisable.

Educational diplomas are issued only to such persons as have held first-grade Territorial or county certificates at least one year, with five years' experience, and have the recommendation of the Territorial board of examiners.

Life diplomas are issued upon the same conditions as educational diplomas, with the added requirement that experience must be of ten years, and examination in pedagogy, history of education, school economy, and school government.

Each person receiving a Territorial diploma pays a fee of $5 to defray expense of its issue.

The Territorial board of examiners, consisting of the superintendent of public instruction and two competent persons appointed by him, has power to adopt regulations governing the examination of applicants for Territorial certificates and for the government of county boards of examiners; to prepare questions for the use of county boards of examiners; to grant recommendations for life and educational diplomas; to grant Territorial certificates of the first grade, valid four years, and of the second grade, valid three years; to review an order granting or revoking a county certificate; to revoke, for immoral conduct or unfitness for teaching, any certificates of its own issue; to renew certificates.

Applicants for first-grade Territorial certificates are examined as for second grade, with algebra, physiology, or natural philosophy added; for second grade, in common English branches, history, and Constitution of the United States, hygiene, and the school laws of Arizona. The standing in each study must be indorsed upon the certificate or it is not valid.

Normal school diplomas from any State normal school in the United States and life diplomas issued by any State board must be recognized as prima facie evidence of fitness for teaching, and on application of holders thereof the board may issue Territorial certificates and fix the grade thereof without examination.

Holders of first-grade Territorial certificates are eligible to teach in grammar schools; of second grade, in primary schools and as assistants in grammar schools, except in the first grades.

The probate judge in each county, ex officio superintendent of the public schools, and two competent persons appointed by him constitute a county board of examiners. This board examines applicants; grants first-grade certificates, valid four years in grammar schools, and second grade, valid two years in primary schools; revokes, for causes before named, certificates of its own issue; grants, without examination, county certificates, fixing the grade thereof, to holders of life diplomas and normal-school diplomas, and renews certificates issued in the county; issues temporary certificates, valid to next regular meeting, upon due evidence of experience, but not more than once to the same person. The subjects for examination are those for the corresponding grades of Territorial certificates, and the standing in each must be indorsed on a certificate or it is not valid.

No one is eligible to receive a certificate to teach who has not reached the age of 18 years.

ARKANSAS, 1897.—The (elected) State superintendent of public instruction furnishes questions for county examinations, grants State life certificates upon examination in branches required for county certificates and algebra, geometry, mental philosophy, history, Latin, constitutions of the United States and Arkansas, natural history, theory and art of teaching.

In each county the county court appoints one or two examiners, one for each judicial district. The examiners are required to be of high moral character and scholastic attainments and to be examined by the State superintendent, or someone appointed by him, using the current questions for first-grade licenses.

The county examiner is to license no one who does not believe in a Supreme Being.

A fee of $2, paid to the county treasurer, is a prerequisite to examination.

Examination.—Common English branches, theory and practice of teaching, physiology and hygiene, method of designating and reading the survey of the lands of the State by ranges, townships, and sections and parts of sections, as surveyed, platted, and designated by the Government of the United States.

According to proficiency shown, certificates are of three grades: First, valid two years; second, valid one year; third, valid six months. They are revocable for immorality or incompetency and for willful failure to teach the method of designating and reading the descriptions of land according to the national land survey.

CALIFORNIA, 1895.—The State board of education, consisting of the governor, superintendent of public instruction, principals of the State normal schools, president of the State University and the professor of pedagogy therein, grants educational diplomas of two grades, valid throughout the State for six years—high school, valid in any school where the holder is not required to teach other languages than English; grammar school, valid in any primary or grammar school. The board also issues life diplomas of two grades, corresponding to those above. Candidates must possess valid local certificates corresponding in grade to the diploma sought, have five years' experience for educational diplomas, ten years' for life diplomas, twenty-one months' service in the public schools of California, pay fees of $2 each for expense of issuing diplomas.

A county board of education, consisting of the county superintendent and four others appointed by the board of supervisors, two, at least, experienced teachers holding valid certificates as high as grammar grade, may issue (1) high-school certificates and (2) grammar-school certificates corresponding to State diplomas for six years, except in their limitation to the county; (3) primary certificates, valid two years; also special certificates for special branches, valid six years. Fee, $2, for teachers' institute and library fund.

The county board prescribes the branches for examination, except that candidates for primary certificates have a prescribed limited list of English studies, including methods of teaching, school law, industrial drawing, physiology, civil government, and vocal music, besides common branches.

The standing in each study and in the class must be indorsed on the certificate to give it validity.

The county superintendent may issue temporary certificates, valid to the next regular meeting of the board, upon like certificates issued by other boards. No fee; not renewable.

The grammar or primary county certificates may be granted without examination to the holders of life diplomas from other States or of educational diplomas of Nevada, Oregon, and Washington, San Francisco normal-class diplomas, California State University diplomas when recommended by the faculty, State normal diplomas of other States, grammar-grade certificates issued elsewhere in the State.

The county high-school grade certificate may be granted without examination

Digitized by Google

to holders of California State University diplomas, when recommended by the faculty; graduates' diplomas of any other institution in the United States recognized by the State board as of the same rank as the State University of California, when the holders have recommendations from the faculties showing that the holders have had academic and professional training of the required standard.

Certain cities having boards of education are authorized to have boards of examiners, consisting in each case of the superintendent and four experienced teachers elected by the board of education.

The powers of the city board of examiners correspond closely to those of the county board, except that the certificates are valid only in the cities where issued and there is a freedom of adjusting requirements to their own needs.

All teachers' certificates and diplomas are revocable for immoral or unprofessional conduct or evident unfitness for teaching.

COLORADO, 1897.—The State board of education, consisting of the (elected) superintendent of public instruction, secretary of state, and attorney-general, upon recommendation of a board of examiners grants permanent diplomas to teachers of eminent ability with two years' experience in the public schools of the State, superseding all other examinations and valid in any locality.

The examinations are prescribed by the superintendent of public instruction and the presidents of the State University, the State Agricultural College, and the State School of Mines. State diplomas may be granted without examination to those of scholarly attainments who have rendered eminent service in educational work of the State for a period not less than five years.

Diplomas of the normal school are valid licenses on registry in the counties where they are to be used. No fee is allowed for normal diplomas or certificates.

Diplomas are revocable after at least thirty days' notice to appear before the board for refutation of charges.

Kindergartens are authorized. The teachers must have diplomas of reputable kindergarten institutes or pass an examination prescribed by the kindergarten department of the State Normal School.

No certificate is required for teachers of music, drawing, or modern languages only.

The (elected) county superintendent holds a quarterly examination, with questions prepared by the State superintendent, upon common English branches, temperance, elements of the natural sciences, theory and practice of teaching, the school law of the State, and issues certificates of three grades: First, valid two years, renewable and available as the basis of an unrenewable certificate in any county; second, valid eighteen months; third, valid nine months—not issued more than twice to one person.

In case of emergency, county certificates of any State may be made good till the next regular examination by indorsement of the county superintendent.

School boards of districts of the first class (school population over 1,000) upon examination can issue certificates valid while teaching in the district.

The county superintendent may revoke certificates for just cause, with right of appeal to the State board.

Any teacher or school officer failing to provide temperance instruction to all pupils under his jurisdiction is to be removed from office.

CONNECTICUT, 1895.—The State board of education, consisting of the governor, lieutenant-governor, and four persons appointed by the general assembly, one each year, may, on such examination as it may prescribe, grant certificates of qualification to teach in any public school in the State and may revoke the same. Such certificates may be accepted by any board of school visitors or board of education in lieu of any other examination.

Digitized by Google

A certificate of approbation signed by a majority of the board of school visitors or by all the committee appointed by them is essential to a teacher in any school receiving any portion of its support from the public money.

DELAWARE, 1893.—The county superintendent—a person of mental and scholarly attainments appointed by the governor—holds examinations, at such times and places as he may appoint, in common English branches, temperance, pedagogy; also in algebra, geometry, civics, natural philosophy, elements of rhetoric. He issues certificates: Professional, to those answering 90 per cent of the questions upon subjects of the first list above and 75 per cent on the second list, valid four years; first grade, for 90 per cent on the first list, valid two years; second grade, for 75 per cent but less than 90, valid one year; provisional, for 60 per cent but less than 75, valid one year.

Revocation of certificates by the superintendent must be confirmed by the State board of education, consisting of the secretary of state and the county superintendents, to be effectual.

DISTRICT OF COLUMBIA, 1897.—The government is unique. The taxes are paid into the National Treasury. Congress controls appropriations. No one votes for public purposes except as he goes to his legal home from which official residence has separated him. Three Commissioners appointed by the President, by and with consent and advice of the Senate, constitute the executive, and, for many details, a legislative body. They appoint two superintendents of schools, one being exclusively for colored schools, and a board of education. Under rules of this board the superintendents and persons selected annually by the committee on teachers and janitors, from the corps of supervising principals and principals, constitute a board of examiners, which holds regular examinations, opening on the third Friday of November and not exceeding three days.

Teachers' certificates are issued in four classes, as follows, commencing with the lowest:

The first-class certificate shall be sufficient evidence of the scholastic qualifications required for teaching in any school from the first grade to the third grade, inclusive; the second-class certificate for teaching in any school from the first grade to the fifth grade, inclusive; the third-class certificate in any school from the first grade to the seventh grade, inclusive; the fourth-class certificate in any school from the first grade to the eighth grade, inclusive; and for all other positions the examinations and certificates shall be special.

Teachers of schools of any grade must be not less than 18 years of age.

Graduates of the Washington normal school [white] and of the [colored] normal school * * * shall be assigned to duty as teachers in the order of their standing and excellence, as shown by the certificates of the respective principals.

Graduates of other approved normal schools shall stand upon an equal footing with certificate holders, and may be nominated instead of the highest certificate holder, in the discretion of the local committee.

No certificate shall be valid when the holder thereof has been out of the service of the District for a term of more than one year, unless leave of absence has been granted by the board.

No teacher shall be employed in any higher grade of schools than that for which his certificate was granted.

FLORIDA, 1894.—The (elected) State superintendent may issue life certificates to holders of State certificates with thirty months' experience in a high school in the State when indorsed by three holders of State certificates as possessing eminent teaching ability and experience, without examination. He may issue special life certificates to eminently successful kindergarten or primary teachers of three years' experience in the State, limited to the class of schools.

The State superintendent issues State certificates to persons holding first-grade certificates with twenty-four months' experience, including eight months in the State, upon examination in geometry, trigonometry, physics, zoology, botany,

Digitized by Google

Latin, rhetoric, English literature, mental science, general history; general average required, 85 per cent; minimum in any subject, 60; valid five years.

A prerequisite for every applicant for examination for any certificate is a fee of $1, for expenses of a grading committee and teachers' institutes.

The (elected) county superintendent conducts examinations with questions prepared by the State superintendent. The answers are designated by numbers, the names of candidates being identified later. They are submitted to a grading committee of three teachers holding the highest grade certificates in the county, selected by the (elected) county board of public instruction before the marking of the grading committee. The superintendent issues certificates of three grades: First, examination same as third, and civil government, bookkeeping, algebra, physical geography; average grade, 80 per cent; minimum in any branch, 60; valid three years, and in any county by indorsement of the local superintendent. Second, examination same as third; average grade, 75 per cent; minimum, 50; valid two years; not more than two issued to the same person. Third, examination common English branches, theory and practice of teaching; average grade, 60 per cent; minimum, 40; valid one year; no teacher to teach more than one year under a third-grade certificate.

Certificates are revocable for cause by the issuing authority.

GEORGIA, 1897.—The (elected) State school commissioner, upon satisfaction with the quality shown in papers of unusual merit, which county commissioners are required to forward to him, issues permanent teachers' licenses, good in any county, revocable by himself for good and sufficient cause. He prepares the questions for county examinations.

In each county the grand jury selects five freeholders as a board of education. This county board selects a county commissioner, ex officio superintendent of common schools. Candidates for this office are examined by the president of the board, or by someone appointed by him, with questions furnished by the State commissioner upon the subjects taught in the common schools—science and theory of common school teaching and government, and such other subjects as the State school commissioner may deem proper.

The county commissioners examine candidates on a day or days fixed by the State commissioner, uniform throughout the State, grading papers submitted by applicants according to instructions of the State commissioner, and submitting the papers with recommendations to the county board, which grants licenses of three grades: First, valid three years; second, valid two years; third, valid one year; according to their rank above the minimum set by the State commissioner. The licenses are valid in other counties by indorsement of local commissioners. As indicated above, papers of unusual merit must be forwarded to the State commissioner.

The county commissioner is required to revoke county certificates for incompetency, immorality, cruelty to pupils, or neglect of duties, with right of appeal to the county board of education.

IDAHO, 1893.—The State board of education, consisting of the superintendent of public instruction, secretary of state, and attorney-general, holds at least two public examinations annually, assisted by one or more persons selected by the board. Upon examination in all branches in the course of study prescribed for the public schools and such other branches as the board directs, and upon satisfactory evidence of "ability to instruct and properly manage any school in the State," the board issues: State diplomas to those of five years' experience, of which two have been in Idaho, valid for life; State certificates, experience, three years, valid five years. The board may issue certificates to persons holding diplomas or certificates from States requiring similar qualifications.

The diplomas and certificates are revocable by the State board, for cause, after at least thirty days' notice for opportunity of defense.

Digitized by Google

The State superintendent prepares questions and prescribes regulations for county examinations. The county superintendent holds one regular public examination and not to exceed three special examinations annually. Candidates must be 18 years of age, pass examination in common English branches, civil government, temperance, theory and practice of teaching, State constitution, and so much of the general school law as relates to teaching. Fee, $1, for institute fund.

The county superintendent issues certificates of three grades: First, to those of one year's experience, valid three years throughout the State on filing a copy in the office of any county superintendent where the holder desires to teach; second, valid two years; third, valid one year; also, temporary certificates, valid in a specified district and only to the next public examination. He may revoke county certificates for cause, but not without opportunity for a personal hearing.

ILLINOIS, 1896.—The (elected) State superintendent, upon public examination, on such terms and by such examiners as the superintendent and the principals of the State universities prescribe, grants State certificates valid in every county and every school district in the State, and of two grades—the higher for life; the lower for five years—revocable by the superintendent on proof of immoral or unprofessional conduct. (Compare with local examinations below.)

The (elected) county superintendent, upon examination in common English branches and temperance, issues certificates of two grades: First, valid two years; second, valid one year; also, special certificates limited in validity to the special study named on the certificate. He may renew certificates by indorsement and may revoke them for just cause. Candidates must be: Males, 18 years; females, 17 years of age.

School districts having a population between 1,000 and 100,000, not under special charters, elect boards of education required to examine teachers as supplemental to any other examination.

The peculiar requirement of the last-named examination led to a correspondence with S. M. Inglis, the State superintendent, whose statements are best given in extracts from two letters.

Under date of December 6, 1897, the superintendent wrote the Commissioner of Education:

> By Article VI, section 10, of the school law, boards of education in districts exceeding 1,000 in population have the authority to examine teachers as supplemental to any other examination, but such examination does not take the place of the examination required by the county superintendent or the State superintendent.
>
> There are 48 districts in the State acting under special charters. * * * Unless otherwise provided by such charters, every teacher in the State, in order to draw public money, must possess either the certificate of the county superintendent or that of the State superintendent.

Under date of December 13, 1897, he wrote:

> A teacher holding a State certificate or a county certificate is subject to the local examination, under Article VI, section 10, provided the local boards require it.
>
> So far as I know, the local examinations seldom occur, * * * the local authorities seeming to construe these provisions as permissive rather than mandatory.

INDIANA, 1895.—The State board of education, consisting of the governor (elected), State superintendent of public instruction, presidents of the State university, Purdue University, and the State normal school, and superintendents of common schools of "the three largest cities in the State," grants State certificates to those possessing eminent scholarship and professional ability, valid to teach in any schools of the State, without further examination, for life.

The examinations are conducted by the county superintendents in February, March, and April. February list: Arithmetic, geography, English grammar, physiology, United States history, reading. March list: Algebra, civil govern-

Digitized by Google

ment, American literature, science of education, and two of the following three—elements of physics, elements of botany, Latin (grammar, two books of Cæsar, two books of Virgil). April list: Geometry, rhetoric, general history, physical geography, and two of the following three—chemistry, geology, zoology.

Applicants for life State license must have forty-eight months' experience, sixteen in Indiana, and pay a fee of $5, in no case to be refunded. A person holding a thirty-six months' license is exempt from the February list.

Applicants for professional license take the March list only and pay no fee. They must have held two thirty-six months' licenses and taught on them not less than five years immediately preceding the examination. The license is valid eight years throughout the State. A general average of 75 per cent with a minimum of 60 per cent in any subject is required. An applicant failing to pass for life State license, but meeting the requirements of a professional certificate, is entitled to it if he reaches the required average for a professional certificate but falls below the standard in one subject. He may be conditioned on such subject and receive a professional license on the same condition as if he had originally applied for a license of this class.

The temperance examination is obligatory for all licenses. The county superintendent, appointed biennially by the township trustees, licenses successful applicants for six, twelve, twenty-four, or thirty-six months, according to the ratio of correct answers and other evidences of qualification given upon examination in branches taught in the common schools. In examinations for graded schools the superintendent may consider any special fitness and make on the certificate a statement of the work for which an applicant is specially qualified. A six months' license is regarded as a trial license, not to be issued twice to the same person.

A person who has taught six consecutive years in the common schools of the State, and who has a three years' license, is exempt from examination so long as he teaches in the common schools of the county in which the current three years' license was obtained; but if he suffers a period of a year to pass without teaching a full school year within it his exemption ceases at the option of the county superintendent.

The county superintendent may revoke county certificates for incompetency, immorality, cruelty, or general neglect of the business of the school.

IOWA, 1897.—An educational board of examiners, consisting of the (elected) superintendent of public instruction, president of the State university, principal of the State normal school, and two persons, one a woman, appointed by the governor for terms of four years, holds annually at least two public examinations and issues—

State diplomas.—Examination as for certificates, and in geometry, trigonometry, chemistry, zoology, astronomy, political economy, rhetoric, English literature, general history, and such other branches as the board may require; valid for life; fee, $5.

State certificates.—Examination, common English branches, physiology, algebra, botany, natural philosophy, drawing, civil government, constitution and laws of Iowa, didactics; valid, five years; fee, $3.

One-half a fee is returned in case of failure. The net moneys are paid into the State treasury.

The board is authorized to issue State certificates to graduates of the State normal school, or of other State normal schools, or to holders of any State certificate of equal rank to those of Iowa, with thirty-six weeks' experience; State diplomas to like persons with five years' experience; also to issue State primary teachers' certificates.

All above are revocable on well-founded complaint entered by any county superintendent.

Digitized by Google

The (elected) county superintendent, holding a first-class or State certificate or diploma conducts examinations monthly on the common English branches and temperance. Special certificates may be issued, covering only the branches named therein.

Fee, $1, for the institute fund.

Certificates are valid for a designated time, not exceeding one year.

Applicants passing also in didactics, elementary physics, elementary algebra, elementary economics, with thirty-six weeks' experience, have certificates for two years. Fee, $2, for institute fund.

Certificates are revocable, with opportunity for a hearing. Teachers failing to teach temperance lessons as provided are to have their certificates revoked and be debarred from teaching one year.

KANSAS, 1897.—A State board of education, consisting of the State superintendent of public instruction, chancellor of the State university, presidents of the State agricultural college and the State normal school, and three appointed by the governor, with advice and consent of the senate, from those in school work in the schools of the State, upon critical examination, issues diplomas to those of two years' experience in the State, superseding all other examinations by local boards, valid in every locality during the life of the holder, unless revoked, as well as certificates valid three years.

The State board is authorized, on application, to examine the course of study and the work of any college or institution of like standing, and if approved as equal to the four years' courses of study in the State normal school the board may accept passed subjects by graduates of such institution and of the State institutions in lieu of examination on the same subjects, but the parties are examined on the professional subjects in the normal-school course and such other subjects prescribed by the board as are not covered by their certified grades from the institutions.

The board issues three-year certificates upon satisfactory examination as above, and at the end of three years, two of which have been spent in teaching, life certificates are issued in lieu of the first.

The board is further authorized to issue two grades—three years and five years—of State certificates of high qualification to such teachers as are found on examination to possess the requisite scholarship, with evidence of good moral character, ability to teach, and skill to govern.

When the papers show a lack of knowledge in common English branches the board is authorized to require a specific examination thereon.

Certificates of other States, secured by an examination equivalent to that of the board, are recognized as a basis to issue like certificates.

All life certificates become void if the holder should not be engaged in school work for three consecutive years, but may be renewed by the board of education.

The board may cancel certificates on satisfactory proof of disqualifying conditions.

A county board of examiners, consisting of the (elected) county superintendent and two competent persons, holders of first-grade or State certificates or diplomas of one of the State institutions, appointed by the county commissioners on nomination of the superintendent, for one year, holds examinations on the last Saturday of January, October, and April, and at the close of the county institute, with questions prepared by the State board of education.

Certificates of three grades are issued: First, age required, 18 years; experience, twelve school months; examination, common English branches, Constitution of the United States, bookkeeping, theory and practice of teaching, elements of natural philosophy, temperance; general average, 90 per cent; minimum, 70 in any one branch; valid three years and. by indorsement of local superintendent, in any

Digitized by Google

county. Second, age 17 years; experience, three school months; examination as above, less bookkeeping and elements of natural philosophy; general average, 80 per cent; minimum, 60 per cent; valid two years. Third, valid one year.

Temporary certificates valid till next regular examination may be issued by the county superintendent upon written request of a district board, upon examination and in case of necessity, but not to one who failed at the last public examination nor twice to the same person.

Examinations are imperative for all county certificates, the temperance examination specifically. The certificates, except temporary, are valid in the county, except in cities of the first and second class having their own boards of examination. All are revocable by the board of examiners for cause. The diploma of the State normal school is a legal certificate valid for all common schools of the State, except, by the attorney-general's opinion, in cities of the first and second class.

KENTUCKY, 1896.—The State board of examiners, consisting of the (elected) superintendent of public instruction and two professional educators appointed by him, upon examination issues certificates of qualification for county superintendents, State diplomas and State certificates to teachers, and prepares questions for examinations by county superintendents, submitting all series of examination questions to the State board of education for their approval. The State board of education consists of superintendent of public instruction, secretary of state, and attorney-general.

State diplomas.—Age required, 24 years; experience, two years in the State; examination (personal) at the State capital last Wednesday of June and of August, in common-school branches, science and art of teaching, psychology, English literature, algebra, higher arithmetic, geometry, physics, and elementary Latin; general average, 90 per cent; minimum in any subject, 70 per cent; valid in all schools maintained partly or wholly by the State till revoked or the holder shall fail for two successive years to be engaged in active school work; revocable by the State superintendent or, so far as his county is concerned, by a county superintendent; fee, $5, to be paid to the two appointive members of the board of examiners.

State teachers' certificates.—Age required, 21 years; experience, two years; examination before county board of examiners in applicant's county, with questions furnished by State board, in subjects as for State diplomas, except geometry, physics, Latin, on the same days in June and August as applicants for county certificates; average as for State diplomas; valid in common or graded schools of the State for eight years unless revoked or the holder shall fail for two successive years to be engaged in active school work; fee, $4, and registration fee for forwarding the answers; revocable as diplomas.

The (elected) county superintendent must hold a valid county certificate of the first class or a State certificate or diploma, which may be granted by examination before the State board or by a special county board consisting of the county judge, county clerk, and a person selected by them, upon questions furnished by the State board.

The county board of examiners, consisting of the superintendent and two strictly moral and well-educated persons holding county certificates of the first class or State certificates or diplomas of literary institutions of high learning, appointed by the county superintendent, examines candidates 18 years of age, with questions prepared by the State board of examiners, upon the science and art of teaching, and the subjects in the common-school course including temperance. The papers of applicants for State certificates justifying the recommendation of the county board are transmitted to the State board, and certificates, upon approval by the latter, are issued as indicated previously. Three classes of county certificates are issued: First, requiring an average grade of 85 per cent on subjects of the common-school course and science and art of teaching: minimum in any subject, 65 per cent;

Digitized by Google

valid four years. Second, average grade, 75 per cent; minimum, 55 per cent; valid two years. Third, average grade, 65 per cent; minimum, 50 per cent; valid one year. They are revocable by the county superintendent for incompetency, inefficiency, immorality, or unworthiness as a teacher.

LOUISIANA, 1894.—The governor, (elected) superintendent of public education, attorney-general, and six citizens appointed by the governor, one from each Congressional district, constitute the State board of education. It appoints parish boards of education.

The diplomas of the State normal school and of the Peabody Normal School at Nashville, Tenn., entitle their holders to first-grade teachers' certificates, valid throughout the State for four years, renewable by the State board of education.

In parishes the parish superintendent (of either sex, elected by the parish board) and two competent persons to aid him, selected by the school board of the parish, form an examining board. When two or more teachers apply for the same position a competitive examination is required, the appointment to be given to the most competent.

Fee for examination, $1 for institute fund, refunded in case of failure to pass.

All teachers teaching "since three years" are exempt from further examination.

The temperance examination is obligatory.

For a high-school or first-grade certificate the applicant must be found competent to teach common English branches, elocution, rhetoric and literature, botany, philosophy, algebra, geometry, and such other studies of high grade as the local board deems necessary. A special certificate of this grade may be issued for specified branches in any academic department.

For a second-grade certificate the candidate is examined in the common English branches and elements of natural philosophy.

For a third-grade, the common English branches.

The certificates are revocable by the parish superintendent, subject to approval of the board, for incompetency, inefficiency, or unworthiness.

MAINE, 1895.—The management of schools in every town devolves upon a superintending school committee.

This committee, upon examination in common English branches, temperance, elements of the natural sciences, especially as applied to agriculture, and such other branches as they desire to introduce in the schools, issues certificates valid one year, renewable. By indorsement they may give validity to any graded certificate issued by normal-school principals or by the State superintendent (appointed by the governor, with advice and consent of the council).

Upon examination to test professional and scholastic abilities, the State superintendent issues probationary or permanent certificates indicating the grade of schools which the holder is qualified to teach. These certificates are to be accepted by local authorities in lieu of the examination by themselves.

MARYLAND, 1894.—The governor, by and with the advice and consent of the senate, appoints at every session of the general assembly four persons, one from the Eastern Shore, who, with the governor and the principal of the State normal school, constitute the State board of education.

In like manner the governor appoints a board of three county school commissioners for each county (six in each of four named counties), one-third every two years.

The State board, on request of county boards, examines candidates for county examiner and may grant to teachers of long experience and established reputation professional certificates valid till revoked for cause.

The board of county school commissioners elects a person not of their number secretary, treasurer, and examiner. Upon examination, and subject to sanction

Digitized by Google

of the board at its next meeting, the examiner issues certificates: First-grade examination, common English branches, bookkeeping, algebra, natural philosophy, with such other as added by the State board; valid five years. Second grade, common English branches; valid six months, to be extended to five years on satisfying the examiner of the proper qualifications.

In the discretion conferred by the law the State board has added: For first grade, general history, including Constitution of the United States and constitution of Maryland; physiology, plane geometry, theory and practice of teaching, laws and by-laws of public-school system of Maryland. For second grade, history of Maryland, history of the United States, constitution of Maryland, Constitution of the United States, physiology, algebra to quadratics, geometry, one book of Wentworth or an equivalent, theory and practice of teaching, laws and by-laws of the public-school system of Maryland.

The diploma of the normal school is accepted as a valid certificate.

Any person holding a first-grade certificate or the diploma of a respectable college, or of a State normal school, having taught seven years, five in Maryland, may apply to the State board for a life certificate.

Male applicants must be 19 years; female, 18 years of age.

No examiner is allowed to charge any fees.

All certificates are revocable for cause.

MASSACHUSETTS, 1898.—The school committee of the town is to ascertain by personal examination the qualifications of candidates for teaching and their capacity for the government of schools. The diplomas of the State normal schools may be accepted by school committees of towns and cities in lieu of personal examination.

By an act of April 28, 1894, provision was made for examination and certification of teachers by the State board of education, consisting of the governor, lieutenant-governor, and eight persons appointed by the governor with the advice and consent of the council, to test professional as well as scholarly abilities of candidates. Certificates are to be probationary or permanent, and indicate the grades of school to which they apply. School committees may accept the certificates in lieu of local examination. At date of this compilation provision has not been made for carrying the law into effect.

MICHIGAN, 1898.—An (elected) State board of education, having charge of the State normal school, holds at least two meetings annually, at which teachers are examined. It grants certificates entitling the holders to teach in any public school of the State without further examination, valid for life. Two years' experience in the State is prerequisite except for graduates of the literary and scientific departments of the university and of incorporated colleges of the State, who may receive the certificates upon examination. The certificate of completion of an advanced course of study at the normal school, setting forth the studies completed, operates as a life certificate. This document is distinct from a diploma of graduation. The board may grant teachers' certificates without examination to those holding bachelor's or higher degrees and with courses of study of at least a year in the science and art of teaching at an approved college, valid four years, which, upon three years' experience in the State, may be changed for life certificates. Upon completion of the course in the normal school for rural and elementary schools the board issues a certificate valid for schools of the classes named for five years. This may be suspended or revoked by any board of education.

The certificate of the proper faculty of the university to one graduating with a bachelor's or higher degree and completing the pedagogical course is a life certificate, valid anywhere in the State when filed or recorded with the local examiners.

The questions for county examinations are prepared by the State superintendent of public instruction.

Digitized by Google

In each county the board of supervisors appoints two persons as a board of school examiners in connection with the (elected) commissioner of schools, who must be a graduate of a reputable college or equivalent institution, hold a State teacher's certificate, or have held a first-grade certificate, within two years of election, or been county commissioner under the act, except in certain small counties, where a second-grade certificate suffices.

The board of school examiners at appointed times, twice and not exceeding four times a year, upon examination in common English branches, temperance, and government, issues to persons 17 years of age certificates of three grades: First, experience required, one year—valid four years throughout the State by indorsement of the State superintendent and filing a copy in the county where used; second, experience, seven months—valid three years in the county; third, Class A, experience, three years in primary departments of graded schools—valid in such departments only; Class B—valid in any school in the county for one year, no more than three times to the same person.

The board of examiners, without examination, may renew certificates of those who attained 85 per cent in all studies at two previous examinations, since which they have been continuously teaching in the county.

The county commissioner, upon examination, may grant limited certificates for designated districts valid to the next public examination; not twice to the same person nor exempting the teacher from a full examination.

Annual fee, $1 for male, 50 cents for female teachers—initial fee collectible by board of examiners, later payments by director or secretary of board employing the teacher—set apart as an institute fund in the hands of the county treasurer.

In general, all licenses are revocable only by the authority issuing them, but they may be suspended within their jurisdiction by any board after opportunity for a personal hearing.

MINNESOTA, 1897.—Permanent teachers of high character and broad scholarship and who have a successful experience may, upon examination by the State superintendent, or by a committee of three competent teachers appointed by him, receive professional State certificates which shall entitle the holders to teach in any public school in the State without further examination: *Provided*, That no life certificate shall be in force after its holder shall permit a space of three years to lapse without following some educational pursuit, unless his certificate be indorsed by the State superintendent: *Provided further*, That a graduate of a college or university of good standing in the State who has received a first-grade certificate and has taught with ability and success in any public school at least one year shall be entitled to a professional certificate from the State superintendent without further examination.

The branches required for a professional State certificate are written arithmetic, United States history, reading and elocution, English grammar; common and physical geography, with map drawing; mathematical geography and projection, school economy, physiology, algebra, natural philosophy, chemistry, composition and rhetoric, bookkeeping, plane and solid geometry, plane trigonometry, geology, zoology, botany, English literature, general history, political economy, intellectual philosophy, moral philosophy, logic, astronomy, civil government and school laws, history of education, and the theory and art of teaching.

The diploma of a Minnesota normal school is valid as a State certificate for two years. After two years' experience, by indorsement of the president of the normal school and the State superintendent, the diploma of the elementary course becomes valid for five years, and that of the advanced course for life.

County superintendents, upon examination, issue certificates of three grades: First, a term of three months' experience requisite, valid two years; second, valid one year; third, valid in a specified district six months.

Digitized by Google

Examination: Common English branches, temperance, and, for first grade, elementary algebra, elementary plane geometry, physical geography, natural philosophy, civil government, theory and practice of teaching.

Any city, town, village, township, or school district with not less than 500 inhabitants, unless consisting in whole or in part of one incorporated city, town, or village, and not above 6 miles square, may be organized as an independent district, with a board of three examiners appointed by the local board of education so that the term of one expires yearly, who may indorse the certificates issued by the county superintendent on examination made at their request. These examiners are authorized to conduct independent examinations.

The county superintendent may cite a teacher to reexamination, and on being satisfied of defect in learning, character, or ability, or on refusal or neglect to attend, he is to revoke his certificate. Neglect to provide temperance instruction is to be deemed sufficient cause for annulling a teacher's certificate.

Local superintendents may suspend normal certificates. County superintendents and boards of examiners in independent districts have power to revoke certificates issued by them, subject to appeal to the State superintendent.

MISSISSIPPI, 1894.—The board of education, consisting of the secretary of state, attorney-general, and (elected) superintendent of public instruction, appoints a board of three examiners, of whom two are graduates of colleges or teachers with first-grade certificates, to examine all candidates for county superintendent on subjects required for first-class certificates and on the school law. Prerequisite fee, $5, equally divided between members of the board of examiners.

The board of education is empowered to issue professional licenses to teachers of recognized ability upon examination in algebra, geometry, rhetoric, English literature, elements of botany and of chemistry, science of teaching, civil government, Latin (through Cæsar and Virgil).

The State superintendent prepares questions for county examinations.

The county superintendent, appointed by the State board of education, and two first-grade teachers, one appointed by the county school board, the other by the supervisors, constitute a board of examiners. No teacher of a normal or training school is to be on the board.

The county board issues licenses of three grades: First, to those 17 years of age—examination as below, and history of Mississippi, elements of natural philosophy, civil government; those of 85 per cent general average valid two years, those of 90 per cent valid three years, renewable in the county as long as the holder continues to teach, and after five years' teaching under first grade the teacher is exempt from further examination; experience, six months. Second, examination common English branches and temperance, but a certificate is not to be withheld for failure on the latter; general average, 75 per cent; minimum in any branch, 50; valid one year. Third, examination as second; general average, 60 per cent; minimum, 40; valid one year.

The county superintendent may suspend or remove any teacher for disqualifications, and has the same power as a justice of the peace to issue subpœnas for witnesses for inquiry or trial. For good cause he may revoke a license, upon trial, after ten days' notice to the teacher of the charges, with right of appeal to the State board of education.

MISSOURI, 1897.—The (elected) State superintendent of public schools is authorized, on examination, to grant certificates exempting from further examination by any examiners, without any fee, and revocable for incompetency, cruelty, immorality, drunkenness, or neglect of duty.

The normal diploma for the "advanced course" has the force of a permanent State certificate, revocable like preceding.

Digitized by Google

The normal diploma for the "elementary course," bearing the names of the studies completed and the grade in each, is a valid State certificate for two years, revocable as preceding.

The normal diplomas are from the normal schools, the normal department of the State University, and Lincoln Institute.

An institute is required annually in each county. A county institute board of examiners, consisting of the county commissioner and the conductors and instructors of the institute, no minimum being below 50, issues certificates of three grades: First, examination same as second and the third years' work of the institute course; average, 90 per cent; required experience, one year; valid three years. Second, examination same as third and the second years' work of the institute course; average, 85 per cent; valid two years. Third, examination, common English branches, civil government, temperance, first year's work of the institute course; average, 80 per cent; valid one year.

The county commissioner on examination, preceded by payment of a fee of $1.50, issues certificates of two grades: First, examination same as second, and etymology, algebra, zoology, rhetoric, botany, geometry, physics, literature; average as below; valid two years. Second, examination, common English branches, civil government, theory and practice, temperance; average, 80 per cent; minimum, 60 per cent; valid one year.

Certificates are revocable for causes named heretofore, on satisfactory proof furnished the commissioner, all charges to be preferred in writing and signed by the party bringing the accusation.

MONTANA, 1895.—The State board of education, consisting of the governor (elected), state superintendent of public instruction, attorney-general, and eight others appointed by the governor, by and with the consent of the senate, grants: Life diplomas—Examination, same as State diplomas, and elements of botany, geology, political economy, zoology, general history; experience, ten years. State diplomas—Examination, a first-grade county certificate, with English literature, mental philosophy; experience, five years; valid six years.

A State or a life diploma may be granted to any graduate of the State normal school or of the State University after sixteen months' experience in the public schools of the State; also to graduates of other educational institutions in or out of the State, on conditions established by the State board.

The State superintendent may revoke a State or a life diploma for incompetency or immoral conduct, after serving the holder with a written statement of the charges and giving him opportunity for defense before the State board.

The State superintendent prepares all questions for the county superintendent, who must hold a certificate of the highest county grade and have twelve months' experience in the State.

The (elected) county superintendent issues to candidates 18 years of age, who have paid $1 fee for institute fund, certificates of three regular grades: First, examination same as second, and American literature, natural philosophy, plane geometry; experience, twelve months; valid three years, and in any county in the State on registry therein and payment of fee. Second, examination same as third, and civics of the United States and of Montana, physical geography, elementary algebra; valid in the county two years. Third, examination, common English branches, theory and practice; valid one year.

A temporary certificate, good to the next regular examination, not more than once to the same person, is permitted.

Special certificates for penmanship, music, drawing, a modern language, limited to the branches specified, valid three years, are issued on request of district boards.

County certificates are revocable by the county superintendent for causes comprising crime against the State law, incompetency, and neglect of duty.

Digitized by Google

NEBRASKA, 1897.—Upon examination by the State superintendent, or a committee of three competent teachers appointed by him, permanent teachers of high character and broad scholarship, with due experience, receive professional State certificates, valid for any public school in the State, without further examination.

Graduates of colleges and universities of good standing, who have received certificates of the first grade and who have taught in any high school in the State three years, are entitled to professional certificates without further examination.

The (elected) county superintendent issues certificates of three grades: First, examination same as second, and algebra, geometry, and natural philosophy; experience, one year; valid two years. Second, examination same as third, and history of the United States, civil government, bookkeeping, blackboard drawing, theory and art of teaching; valid one year. Third, examination, common English branches and physiology; valid in a specified district not more than six months, no person to receive more than three. The temperance examination is required of all teachers.

Any authority conferring certificates may revoke them, but the county superintendent can only report to other authorities regarding certificates issued by them that they ought to be revoked, assigning reasons therefor.

A student of the State normal school, having completed the common-school course, receives a certificate valid throughout the State for two years; with the higher course, completed, receives a diploma, valid three years, and after teaching the equivalent of two annual terms of six months each, duly certified, receives an additional diploma good for life. A graduate in the higher course with three years' previous experience is entitled to a life diploma on graduation.

To be valid locally, State certificates or diplomas are registered in the county where they are to be used, with a fee of $1 for the institute fund.

Life diplomas are void after the holders permit a space of three years to lapse without following some educational pursuit, unless indorsed by the acting State superintendent.

NEVADA, 1893.—The State board of education, consisting of the governor, (elected) superintendent of public instruction, and attorney-general, grants: Life diplomas on same conditions as educational diplomas, except requiring ten years' experience; educational diplomas to such as have held a State certificate or a first-grade county certificate one year, with five years' experience, valid six years; State certificates upon an appeal only after examination by a county superintendent, and on his recommendation renewing a certificate or making it valid throughout the State.

The State board may grant to the holder of a life certificate of any State, or diploma of any State normal school who has taught continuously since issuance of his diploma or certificate, a State certificate without examination.

The board grants to graduates of the normal department of the State University a first-grade State certificate, valid five years; and to those holding these certificates after four years' experience in any State life diplomas.

The regents of the university may issue elementary diplomas to those completing at least two-thirds of the normal course upon which the State board is to issue second-grade State certificates, valid for such period as deemed proper, in their discretion.

The State board prepares all questions for county examinations.

A county board of examination, consisting of the (elected) county superintendent and two competent persons appointed by him, grants to those who have passed examination upon the branches pursued in the respective grades: Certificates of the first grade for unclassified grammar and high schools, valid three years; second grade, for primary schools, valid two years. The holder of a life certificate of any State or a California State Normal School diploma issued within five years receives a county certificate without examination.

NEW HAMPSHIRE, 1895.—The State superintendent of public instruction, appointed by the governor, holds examinations, through such persons and in such manner as he may designate, to test professional and scholastic abilities of applicants. To those passing in branches required to be taught and such other respects as the superintendent requires he issues either probationary or permanent certificates, indicating the grade of school in which the holders are qualified to teach.

Local school boards are required, upon examination, to issue certificates, valid not more than one year, to those passing satisfactorily in branches prescribed by law, including temperance for all schools above the primary. They may accept certificates issued by the State superintendent in lieu of a local examination.

NEW JERSEY, 1895.—The State board of education consists of two members from each Congressional district, appointed by the governor.

The State superintendent of public instruction, appointed by the governor, is ex officio secretary of the State board of examiners.

The State board of examiners, consisting of the State superintendent and the principal of the State normal school, grants certificates, under regulations prescribed by the State board of education, valid in any part of the State for schools not higher than the grade specified in the certificate.

The county board of examiners, consisting of the county superintendent (appointed by the State board of education) and a number of teachers, not exceeding three, holding State or first-grade county certificates, acts in accordance with regulations prescribed by the State board.

Under the regulations the required minimum average in any subject is 70 per cent.

The diploma of a college in good standing is accepted in lieu of examination in prescribed academic subjects.

The State board may indorse the diploma of any normal school or training college or permanent certificate of another State deemed equivalent in requirements to those in New Jersey, giving the document full force in the State.

Any board of examiners accepts certificates of any grade, except third-grade county, carrying a general average of 85 per cent in lieu of examination on the topics specified, provided the holder has been continuously teaching since its issue.

Special certificates may be issued valid three years for subjects specified.

The State board of examiners, with two examinations yearly, grants State certificates of three grades: First, age, 25 years; experience, 5 years; examination same as second grade; valid for life for any school in the State. Second, age, 21 years; examination same as third grade, with philosophy of education, principles of manual training, and physical culture; valid ten years in any school, renewable without reexamination. Graduates of the State normal school who have completed the three years' course are entitled to a second-grade State certificate, good for life. Third, age, 20 years; examination same as first-grade county certificate, with psychology, plane and solid geometry, chemistry, geology, botany, free-hand drawing; valid seven years, like preceding.

The third-grade State certificate is deemed to rank next above a first-grade county certificate.

The temperance examination is obligatory for all certificates.

County superintendents issue certificates of three grades: First, age required, 20 years; experience, two years; examination same as second, with algebra, physics, history of education, Constitution of the United States, school law of New Jersey; valid in any school or department in the county for five years; renewable without reexamination. Second, age, 19 years; experience, one year; examination same as third, with English composition, physiology, history of the United States, bookkeeping; valid three years for any school or department not above grammar grade. Third, age, 18 years; examination, common English branches, with theory and

Digitized by Google

practice and temperance; valid one year in ungraded or primary school; not issued to the same person more than once.

Every county certificate shows the average made in each study.

Any certificate may be revoked for cause by the board issuing it, or by the State board of examiners.

NEW MEXICO, 1895.—Diplomas of graduates of the normal schools, the Territorial university, the school of mines, the agricultural college, and teachers' graduate diplomas of St. Michael's College are valid first-class certificates in all counties. The (elected) county superintendent, with two competent persons appointed by the judge of the district court, issues certificates of three years, upon such examination as prescribed by the Territorial superintendent (appointed by the governor).

NEW YORK, 1896.—The State superintendent of public instruction (elected by joint ballot of the senate and assembly), upon examination, may grant certificates of qualification valid in any public school of the State; without examination, may issue to graduates of colleges and universities, with three years' experience, a so-called "college graduate's certificate;" may indorse normal school diplomas, or State certificates from any other State, giving them the validity of diplomas and certificates issued in the State; may issue temporary licenses, limited to a school commissioner's district or to a school district, for a period not exceeding six months.

The diploma of a State (New York) normal school is a valid certificate for common schools. The following statsments are important in this connection: About 3,000 State certificates, valid for life, were issued previous to 1875, without examination. Since 1875 no such certificates have been issued, except on thorough examination; 623 certificates have been awarded. Fifteen districts, organized by special acts before the adoption of any general standard of qualification in the law, claim the right to examine and license teachers employed therein. "In some cities even State certificates and normal-school diplomas are not accepted. This action can not be justified." (Forty-third Annual Report State Superintendent New York, year ending July 31, 1896, pp. xx-xxii.)

The (elected) school commissioner in each commissioner district (from one to three districts in a county), upon examination under regulations prescribed by the State superintendent, issues certificates of qualification.

All candidates must be 18 years of age.

The temperance examination is universally obligatory.

The State superintendent, on cause shown to his satisfaction, may annul any certificate or normal diploma and may reconsider and reverse his action.

The district commissioner, on examination of charges, with opportunity afforded the teacher for defense, may annul any certificate and declare the holder unfit to teach if charges are sustained.

From January 1, 1897, it has been required that any person to be licensed to teach primary and grammar schools in any city authorized to employ a superintendent of schools shall have three years' experience or have graduated from a three years' course in a high school or academy or equal institution approved by the State superintendent, and also have graduated from a school or class for professional training of not less than thirty-eight weeks, in lieu of which may be accepted a State normal diploma or a State certificate, obtained on examination.

The board of education of any city, except the city of New York, and of any village with a superintendent, is authorized to maintain a normal school or class not less than thirty-eight weeks in any school year.

Boards of education in cities of the first and second class, through a board of examiners, are authorized to issue local high-school, grammar, and primary certificates, valid one year and renewable; temporary certificates, valid to next regular examination, not renewable; special certificates for special branches, all revocable for causes named in previous cases.

NORTH CAROLINA, 1897.—The State board of examiners—consisting of the State superintendent as chairman and three professional teachers appointed by the State board of education—has power to grant first-grade life certificates. The board furnishes the questions to county supervisors for candidates and grades the answers. Prerequisite to examination is a fee of $5 for the general school fund of the county. To be kept valid the certificate must be renewed every five years upon an affidavit of having taught since the last renewal. No fee is required for renewal.

The graduates of Peabody Normal College, Nashville, Tenn., in the degree of licentiate of instruction or higher, are recognized as certified for life as teachers in any and all public schools.

Certificates are revocable for cause. A county board of education—consisting of three men of good business qualifications, known to be in favor of public education, elected by the board of county commissioners—with the clerk of the superior court and the register of deeds elects a county supervisor of schools, a practical teacher or with at least one year's experience.

The supervisor examines teachers on prepayment of a fee of $1 for regular quarterly days and $1.50 for any other day, paid into the general school fund of the county. The subjects are the common English branches and temperance.

No certificate is to be issued to an applicant making less than 50 per cent in any one branch.

A general average of 90 per cent and over entitles the applicant to a first-grade certificate; a general average of 80 to 90 per cent, to a second grade.

Certificates are valid for one year.

NORTH DAKOTA, 1896.—The (elected) superintendent of public instruction, the holder of a State certificate of the highest grade issued in some State, or a graduate of a reputable university, college, or normal school prepares or causes to be prepared all questions for examination of teachers, county and State, and prescribes the scale of marking. He may issue a State certificate valid for life, known as a professional certificate, on examination, to a candidate of five years' experience, or to a graduate of the four years' normal college course in the University of North Dakota with three years' experience, without examination.

If the holder of a professional certificate ceases for the space of three years to be engaged in active educational work he is liable to reexamination and to cancellation of his certificate under rules prescribed by the State superintendent.

The State superintendent may issue, with or without examination in his discretion, to a graduate of a normal school in the State or elsewhere with two years' experience, a normal certificate valid throughout the State for five years. A graduate of the four years' normal course in the University of North Dakota with one year's experience may receive this diploma without examination.

Fee for above certificates, $5, to be used for teachers' reading circles.

The (elected) county superintendent issues certificates of three grades: First, age required, 20 years, experience, twelve months; examination, same as second, and physical geography, elements of natural philosophy, physiology, geometry, algebra; valid three years. Second, age required, 18 years; examination, same as third, and theory and practice of teaching; valid two years. Third, age required, 18 years; examination, common English branches, temperance.

Fee, $1, for county institutes.

All certificates are revocable for cause, generally with opportunity for defense. Revocation is mandatory for neglect to teach the temperance lessons.

OHIO, 1897.—A State board of examiners, consisting of five competent persons appointed by the (elected) State commissioner, upon examination and professional experience, issues three grades of life certificates for different grades of

Digitized by Google

schools according to branches taught therein, valid without other examination throughout the State. Fee, $5.

In each county the probate judge appoints a board of three examiners, including two teachers, using in their option questions prepared by the State commissioner and the secretary of the State board of examiners. This board issues certificates valid for one, two, or three years in the county outside city and village districts that have boards of examiners; also certificates valid five years, renewable upon examination and three years' recent experience; also special certificates for special studies and for primary departments. Temperance examinations are uniformly required. Fee, 50 cents.

All certificates are revocable for good cause. Revocation is mandatory for willfully refusing or neglecting to teach the temperance lessons.

OKLAHOMA, 1897.—A Territorial board of education, consisting of the Territorial superintendent of public instruction (appointed by the governor, with advice and consent of the Territorial council), president of the Territorial normal school, president of the University of Oklahoma, and one county superintendent, appointed by the governor, issues Territorial certificates and diplomas and prepares questions for county and city examinations.

In each county is a board of examiners composed of the superintendent and two competent persons, holders of first-grade certificates, Territorial certificates, or graduates of some State university, normal school, or agricultural college, appointed by the county commissioners on nomination of the superintendent.

County certificates are of three grades: First, age required, 20 years; experience, twelve months; examination, same as second, and bookkeeping, natural philosophy; general average, 90 per cent; minimum in any branch, 70; valid three years. Second, age required, 18 years; examination, same as third, and civil government; general average, 80 per cent; minimum, 60; valid two years. Third, age required, 16 years; examination, orthography, reading, writing, English grammar, composition, geography, arithmetic, United States history, physiology and hygiene, theory and practice of teaching; general average, 70 per cent; minimum 50; valid one year.

Also, temporary certificates, valid till next regular examination in a designated district, only once to the same person.

Fee, $1, for institute fund.

Revocable for cause.

OREGON, 1893.—A State board of education, consisting of the governor, secretary of state, and (elected) superintendent of public instruction, on examination, grants:

Life diplomas, valid in any public school; fee, $10.

State diplomas, valid, as above, for six years; fee, $6.

State certificates: First grade, valid, as above, for two years; fee, $4. Second grade, valid, as above, for six months; fee, $2.50. These are the equivalents of county certificates of like grade, except in area of validity.

The fees constitute a fund to pay expenses of professional teachers invited to act as assistants in the examinations.

The board may issue, in its discretion, without examination, diplomas and certificates to persons presenting diplomas and certificates of like grade and kind from other States.

All the above are revocable for immoral or other unprofessional conduct.

By rules of the State board the requirements are:

For life diplomas, examination same as State diplomas; general average, 90 per cent; minimum in any branch, 75.

Digitized by Google

For State diplomas, examination same as first grade certificates, and Constitution of the United States, general history, plane geometry, English literature, natural philosophy; general average, 85 per cent; minimum, 75.

For first-grade certificates, examination same as second grade, and algebra, bookkeeping, composition, and school law of Oregon; general average, 85 per cent; minimum, 60.

For second-grade certificates, examination common English branches and theory and practice of teaching; temperance; general average, 75 per cent; minimum, 50.

By the law teachers with first-grade county certificates and three years' experience, fees paid, are entitled to first-grade State certificates without further examination; those with State certificates and four years' experience, fees paid, and (county) examination in bookkeeping, composition, and physical geography, are entitled to State diplomas; those with State diplomas and six years' experience, fees paid, and (county) examination in algebra, English literature, State school law, and general history, are entitled to State life diplomas.

Persons 21 years of age, or, if females, 18 years of age, at least one year in normal school, having completed the course and passed examination thereon, with six years' experience, and fees paid, are entitled to life diplomas.

All graduates of the State normal school are authorized to teach in any public school in the State.

A county board of examiners, consisting of the (elected) county superintendent and two competent persons appointed by him, upon examination in the same branches as for State certificates, and marking on the certificates the standing in each branch, issues three grades of certificates, no grade renewable or to be issued to the same person twice, valid only in the county: First, age required, 18 years; experience, twelve months; general average 90 per cent; minimum in any branch, 70; valid three years. Second, age required, 17 years; experience, three months; general average, 80 per cent; minimum, 60; valid two years. Third, general average, 70 per cent; minimum, 40; valid one year. Fee, $1, for institute fund.

The county superintendent may issue a temporary certificate, in case of necessity, good to next regular examination, not twice to the same person, nor to one who failed at the last regular examination. Fee, $2.50, for institute fund.

PENNSYLVANIA, 1896.—The (State) superintendent of public instruction (appointed by the governor and confirmed by the senate) issues permanent certificates to teachers holding professional certificates, with applications duly indorsed by boards of directors in whose employ they have taught the last three years, and the county superintendent, and by a committee of three practical teachers holding valid certificates, appointed by the State superintendent as examiners, with or without examination, in their discretion, valid locally, with provision for validity for one year in any part of the State, and permanently thereafter. He also, without examination, grants permanent State certificates to graduates of reputable colleges with courses of study not less than four years, 21 years of age, and with three years' experience in the public schools of the Commonwealth.

A board of examiners, consisting of the State superintendent, 2 principals of normal schools, and 2 to 6 local superintendents, selected by the State superintendent, examines candidates for graduation in the normal schools, giving normal elementary certificates setting forth expressly the branches in which each is found qualified, including theory but not practice of teaching; also examines teachers of three years' experience in like manner for practical teachers' State certificates of scholarship; the certificates valid throughout the State without further examination and with the privilege of additional indorsement of the fact when an additional subject has been passed, including practice of teaching, after full graduation and two

Digitized by Google

years' experience, becoming a master's normal certificate, or three years' experience for those not normal graduates, becoming a full practical teacher's State certificate.

The local superintendent must possess a diploma of a reputable college, a State normal school, a professional certificate, or a certificate of competency from the State superintendent, and have had successful experience in teaching within three years of his election. The county superintendents are elected by the school directors (of the towns).

All certificates show the branches passed and the proficiency in each. The temperance examination is obligatory for all certificates, and any school committees or boards of control failing to provide for instruction in temperance for all pupils in all departments of public schools and for institutions supported wholly or in part by money from the Commonwealth forfeit their share of the State appropriations.

Local superintendents issue two grades of certificates: Professional, to those with thorough knowledge and successful experience; valid one year after the term of the superintendent issuing it, and renewable without examination. Provisional, to those with fair knowledge of the (elementary) branches and theory and practice of teaching, or to those with thorough knowledge but little or no experience; valid one year.

Certificates are revocable on ten days' notice. "The words of the law, taken literally, confer the arbitrary power without reason assigned or hearing. But no person fit for that responsible office [county superintendent] will attempt to exercise it in such manner."[1]

RHODE ISLAND, 1898.—No person shall be employed to teach, as principal or assistant, in any school supported wholly or in part by public money unless such person shall have a certificate of qualification issued by or under authority of the State board of education.

The State board of education shall hold or cause to be held in such places in different parts of the State, and at such times as they may determine, examinations for the position of teacher in the public schools of this State, and said board of education is hereby authorized to issue certificates of qualification, which shall be valid throughout the State for the grade and time specified therein.

Said board of education may at any time annul, for cause, any certificate issued by them after due notice to the holder thereof, and an opportunity for a hearing, if desired.

Said State board of education may, in their discretion, issue certificates of qualification, without examination, to persons who have taught in the public schools in this State for three or more years upon their filing with said board a written application approved by the school committee of the town where the applicant shall have taught the greater part of the three years next preceding the date of the application.

SOUTH CAROLINA, 1898.—The State board of education—consisting of the governor, (elected) State superintendent of education, and seven persons, one from each Congressional district, appointed by the governor—prescribes rules for the examination of teachers, grants State certificates, and revokes them for immoral or unprofessional conduct, profanity, or evident unfitness for teaching. Graduates of the Memminger Normal School, Charleston, are not required to have certificates except as required by the board for the city of Charleston.

A county board—consisting of the superintendent (elected) of education and two other persons, appointed by the State board and qualified to hold first-grade certificates—examines teachers and gives certificates under regulations of the State

[1] Common-school laws of Pennsylvania and decisions of the State superintendent, 1898, No. 173, p. 242.

Digitized by Google

board. A full diploma from any chartered college or university in the State, or the Memminger Normal School exempts from examination as to qualification.

By the rules of the State board, teachers' State certificates are issued to candidates 20 years of age who pass satisfactory written examination or present full diplomas from some college or university of standing satisfactory to the board; valid throughout the State for two years; renewable. Applicants before county boards are examined in common English branches, history of South Carolina, temperance, theory and practice of teaching, elementary algebra, drawing, English literature, and vocal music, with questions furnished by the State board.

There are two grades of teachers' county certificates. First, general average, 80 per cent; minimum on any branch, 50. Second, Class A—average 80, minimum 50; Class B—average 70, minimum 40. Candidates must be 18 years of age. Certificates are valid two years. First, renewable; second, renewable only when holder attends a teachers' institute; B, not renewable.

The county board may recognize certificates issued in other counties. Certificates are revocable by the authority issuing them, for immoral or improper conduct or evident unfitness for teaching.

Universities and colleges are authorized to provide a course of study, to be approved by the State board of education, on completion of which the degree of Licentiate of Instruction is to be given the student, and the presentation of the diploma for this degree to a county board of education will entitle the holder to a first-grade teachers' certificate to teach in the public schools of the county.

SOUTH DAKOTA, 1893.—The State superintendent prepares all questions for examination of teachers by county superintendents, and has power to grant State certificates and State diplomas, with examinations at least twice each year.

A State diploma is valid for life.

Candidates must have ten years' experience; present the diplomas of the institution of which they are graduates or be examined in branches selected by the State superintendent; be examined more or less fully in theory and practice, according as they are or are not graduates of reputable normal schools; be examined in two subjects, selected from geometry, trigonometry, astronomy, chemistry, zoology, or geology; also in two from English literature, rhetoric, general history, political economy, or psyschology. Each writes a thesis of 3,000 to 5,000 words upon a topic in one of the branches under examination; submits a thesis on a prefessional subject chosen by the superintendent. Fee, $10.

A State certificate is valid five years in any of the common schools of the State, including those in cities and towns. Candidates must have three years' experience, pass examinations in algebra, geometry, natural philosophy, physiology, and hygiene, drawing, civil government, general history, and American literature. The judgment as to English grammar, orthography, and penmanship is based upon the papers submitted.

The diploma of one of the State normal schools entitles the holder to receive the State certificate free of charge. Usual fee, $5.

The fees above are for the State teachers' reading-circle fund.

State certificates and diplomas are revocable by the State board of education.

County superintendents, after examinations, held quarterly, issue certificates of three grades: First, required age, 18 years; examination same as second and current events, bookkeeping, American literature, drawing; valid in every county; issued by the State superintendent on approval of the marking of the county superintendent. Second, required age, 17 years; examination same as third and civil government, didactics; valid one year in the county. Third, examination, common English branches, temperance; valid one year or less in designated schools. Fee, $1; for county institute fund.

Digitized by Google

Revocable, after opportunity for a fair hearing, for causes, including neglect to attend county institute.

In cities and other independent districts teachers engaged exclusively in teaching music or other specified special subjects are not required to hold a county certificate.

TENNESSEE, 1895.—The State superintendent of public instruction—a person of literary and scientific attainments and of skill and experience in the art of teaching, nominated by the governor and confirmed by the Senate—prescribes the mode of examining and licensing teachers and their necessary qualifications.

The county superintendent, of like qualifications as the State superintendent, selected by the county court, examines candidates and issues certificates as indicated by the State superintendent.

The temperance examination, including the effect of cigarette smoking on the human system, is obligatory.

Diplomas of graduation from normal schools of the State are valid as State licenses and exempt the holders from further examination.

TEXAS, 1897.—The (elected) State superintendent of public instruction is authorized to appoint a State board of examiners, not less than three competent teachers, to serve during his pleasure.

Teachers holding diplomas from a Texas State normal school, the Peabody Normal School, at Nashville, Tenn., the North Texas Normal College, Denton, Tex., or Coronal Institute, San Marcos, Tex., may teach in the schools of the State during good behavior, their diplomas ranking as life certificates.

Teachers holding first-grade certificates from a Texas State normal school may teach four years from the dates; teachers holding similar certificates of second grade may teach two years from dates; teachers holding Texas Summer Normal School certificates may teach four years, exempt from any examination.

Diplomas conferred, by the regents of the University of Texas on students completing some degree course, and also the degree course of the School of Pedagogy, have the force of permanent State certificates.

Certificates issued by the School of Pedagogy to students completing the advanced or special professional or graduate course have the force of first-grade State certificates for four years.

Certificates so issued to those completing the junior course have the force of like certificates for one year.

Any teacher of three years' experience in Texas holding a diploma of the degree of bachelor of arts, bachelor of science, bachelor of letters, or a higher degree from any first-class college or university may receive a permanent State certificate.

All the above are good throughout the State and during good behavior where no limitation is specified.

A county superintendent may be elected, as provided, by the commissioners' court; the county judge in a county without a superintendent acts as superintendent.

The county superintendent appoints a county board of examiners of three white teachers holding first-grade certificates to serve during his pleasure.

Previous to examination each candidate must satisfy the county superintendent that he can speak and understand the English language sufficiently to use it easily in conversation and in giving instruction, and pay a fee of $3. The candidate must present a recommendation of the superintendent to the examiners.

The county board of examiners uses questions prescribed by the State superintendent, and on its recommendation the county superintendent issues certificates of four grades: Permanent, Experience required, three years; examination same

Digitized by Google

as first grade and history of education, general history, psychology, English and American literature, chemistry, solid geometry, plane trigonometry, elementary double-entry bookkeeping; general average 85 per cent, minimum on any subject 50; valid during good behavior. First, examination same as second, and physics, algebra, elements of geometry, constitutions of the United States and Texas, elements of mental and moral science; general average 85 per cent, and minimum 50; valid four years, but void if the holder withdraws two years or more from school work; with general average 75, minimum 50, valid two years. Second, examination same as third, and United States history, elementary principles of civil government, physical geography; with general average 75 per cent, minimum 50, valid two years; with general average 85, minimum 50, valid four years. Third, examination common English branches except United States history, Texas history, elementary physiology, and hygiene and the laws of health with special reference to narcotics, school management and methods of teaching; general average 70 per cent, minimum 50; valid one year, in no case out of the county of issue.

A city or town of 500 scholastic population—that is, an independent district with a local tax for education, a system of free schools nine months yearly, and a superintendent—may have a city board of examiners, consisting of the local superintendent and two teachers appointed by him, authorized to issue certificates—valid in the city, but rendered valid for any other city by due indorsement of local authorities—permanent and temporary, three classes of each: High school, intermediate, primary. Teachers of special branches not in the list required for State certificates need no certificates.

There is provision for making county certificates valid throughout the State through cooperation of the county superintendent, the State superintendent, and the State board of examiners with the county board of examiners, in which case $1 of the fee is forwarded to the State superintendent. The balances of fees, after paying expenses of examination and any deduction for transmission to the State superintendent, are divided among the examiners.

Any certificate may be canceled by the authority issuing it, provided the holder shall have opportunity to be heard, with right of appeal to the State superintendent and to the State board of education.

UTAH, 1896.—The State board of education, consisting of the (elected) State superintendent of public instruction, the presidents of the University of Utah and of the Agricultural College, and two other persons of large experience and eminent professional standing, appointed by the governor, by and with the consent of the senate, issues diplomas of two grades: State high school, State grammar; also State grammar certificates valid in any county, city, town, or school district. The high-school grade State diploma is valid for any department; the grammar grade and the State certificate are valid in grammar and primary departments; diplomas, for life; certificates, for five years. All candidates must be 20 years of age with two years' experience in the State. They are required to show by examination or other evidence high scholarship in common English branches, political and physical geography, physiology, algebra, physics, rhetoric, drawing, plane geometry, botany, English literature, general history, civil government, history and science of education, psychology. The grammar-grade candidates are also tested in nature studies; the high-school grade in solid geometry and any three of the following: French, German, Latin, Greek, trigonometry, zoology, biology, mineralogy.

Normal certificates and normal diplomas issued by the University of Utah subsequent to March 10, 1892, have the validity of State certificates, and the holder after two years' experience in the State is entitled to a State diploma of high-school grade.

Life diplomas issued in other States and shown to be of equal rank to those of

Digitized by Google

Utah may be given full validity by countersignature by the State superintendent under direction of the State board, after two years' experience in the State.

Any professional diploma or certificate becomes void if the holder allows a space of five years to elapse without following some educational pursuit.

The expense of State examinations is paid out of the State school fund.

The State board is required to revoke, for immoral or unprofessional conduct or evident unfitness for teaching, State diplomas and State certificates.

VERMONT, 1893.—The superintendent of education (elected by the general assembly), and the governor appoint one man in each county as examiner of teachers. The superintendent prepares the questions and prescribes rules for examinations.

A graduate from the higher course of a normal school in the State has a diploma valid as a State license for ten years. By concurrent action of the State superintendent and the examiner for the county where the holder last taught, he may receive without examination a certificate valid till revoked by like authority.

A person who has held examiner's certificate of the first grade for ten successive years, and has had in that time two hundred weeks' experience, may be granted a certificate as above.

A certificate of graduation from the lower course of a normal school in the State is a valid State license for five years.

The county examiners issue, upon examination, certificates of three grades: First, experience required, forty weeks; valid five years. Second, experience twelve weeks; valid two years. Third, may be limited to a school; valid for a specified time not exceeding one year; not issued a second time to one of twenty-four weeks' experience.

An examiner may issue certificates, valid in his county, to those holding diplomas of the highest course in normal schools of other States.

Certificates held by teachers continuously employed in union and graded schools are valid while the teachers continue in the same.

A graduate of any college approved by the State superintendent, with twenty-four weeks' experience in public schools of the State, may receive from the examiner of the county where he last taught, without examination, a certificate of the first grade.

Town superintendents may issue permits to teach particular schools, valid one term, not renewable more than three times.

VIRGINIA, 1892.—The State board of education—consisting of the governor, the superintendent of public instruction (elected by the general assembly), and the attorney-general—appoints and removes county and city superintendents, subject to confirmation by the senate.

The superintendent of public instruction issues two grades of State certificates:

Life diplomas: Experience required, two years; examination the same as for first-class county certificates, and such other branches as the State superintendent may direct.

Professional: Examination and experience as life diplomas; valid seven years.

If the holder of a life diploma ceases for a space of three years to be engaged in active educational work he is liable to reexamination and cancellation of his certificate. The State certificates are valid in every city and every county without further examination.

All certificates are revocable for good cause.

County and city superintendents issue certificates stating the branches upon which the holders have been examined, and of three grades: First, age required, 20 years; experience, ten months; examination same as third, and theory and practice of teaching; valid three years, and, by indorsement of the local superintendent

Digitized by Google

in any county or city, renewable for a period not exceeding two years. Second, age required, 18 years; examination same as first; valid two years in the city or county where issued. Third, age required, 18 years; examination, common English branches, with physiology and hygiene; valid one year where issued.

In Virginia cities are not parts of counties; their residents pay no county taxes on property lying in the cities, and in their relation to the State cities are like counties, except in particulars specifically stated in individual charters.

WASHINGTON, 1893.—The State board of education, consisting of the (elected) State superintendent of public instruction and four suitable persons, two at least from those teaching in the common schools, appointed by the governor, by and with the advice and consent of the senate, sits as a board of examination, and also prepares a uniform series of questions for county boards of examiners.

The State board issues certificates of two forms, revocable for cause deemed sufficient by the board.

Life diplomas.—Experience required, ten years, one year in the common schools of the State; examination, as for State certificates; valid in any common school.

State certificates.—Experience required, twenty-seven months, nine in public schools of the State; examination, same as first-grade county certificates and pedagogy, plane geometry, geology, natural history, civil government, psychology, bookkeeping, composition, English literature, and general history, or file a certified copy of a diploma from some State normal school, or of a State or Territorial certificate from any State or Territory, based on requirements not less than those of Washington; valid five years in any common school; renewable without examination.

A county board of examiners, consisting of the superintendent and two persons holding the highest grade certificate in the county appointed by him, under rules, and only with questions prescribed by the State board, issues certificates of three grades to candidates 17 years of age who have attended a teachers' institute: First, experience required, one school year of nine months; examination, same as third, and natural philosophy, English literature, algebra; valid five years. Second, examination, same as third; valid two years. Third, examination, common English branches, physiology and hygiene, Constitution of the United States, school law and constitution of Washington, theory and art of teaching.

In their discretion, without examination, the board may issue certificates to graduates of the normal department of the State University, of any State normal school, or to holders of State certificates, or life diplomas of any State or Territory.

The county superintendent, in certain cases of necessity, issues a temporary certificate, valid till the next regular examination, to a teacher holding an equal certificate from any other county or State, any normal school, or the normal department of the State University.

All certificates are revocable for cause, including neglect to attend the annual county institute.

WEST VIRGINIA, 1893.—A State board of examiners of four competent persons, one from each Congressional district, appointed by the (elected) State superintendent, a person "of literary acquirements and skill and experience in the art of teaching," may issue: First-class certificates, valid twelve years, renewable without examination to those who have taught eight of the twelve years. Second class, examination requirements as for county certificates and at least four other branches determined by the board; issued on application to graduates of the State Normal School and the State University after three years' teaching experience under a No. 1 county certificate.

Teachers who have taught four years under second-class certificates are entitled to receive, without examination, first-class certificates at the expiration of the second class.

Digitized by Google

All certificates issued by the State board are equivalent to No. 1 county certificates and valid in any district in the State.

Fee, $5. The board of examiners is compensated, but in no case beyond the amount of fees.

Certificates are revocable for cause.

The temperance examination is universally obligatory.

In every county is a board of examiners, composed of the county superintendent and two experienced teachers holding State certificates or No. 1 county certificates, or graduates of reputable schools, appointed by the superintendent and confirmed in a meeting of the presidents of the district boards of education; compensated ($3 per day) from fees of applicants ($1 each), not to exceed the fees.

No applicant is to be examined unless 16 years of age.

No diploma or recommendation from any institution or its officers is to supersede a careful examination on each branch and the art of teaching, the grade in each to be stated.

First-grade certificates.—Examination upon lower grade branches, with general history and bookkeeping; general average, 90 per cent; minimum in any branch, 75; valid four years, renewable once, in discretion of board, provided the holder has taught two years on the certificate.

Second grade.—Examination upon branches required to be taught in the primary free schools, with civil government and the theory and art of teaching; general average, 80 per cent; minimum, 70; valid two years; reissued only on reexamination.

Third grade.—Examination subjects as above; general average, 70 per cent; minimum, 60; valid one year; reissued only on examination, and not more than twice.

Failure to attend the county teachers' institute, unless excused by law, is a cause for revoking a certificate.

WISCONSIN, 1893.—The (elected) State superintendent appoints annually a board of three competent persons to examine candidates for State certificates, and prescribes regulations for examination. Upon report of the board that a candidate has the qualifications of a first-grade county certificate, and has passed in mental philosophy, English literature, and such other branches as may have been prescribed, the superintendent issues an unlimited State certificate, valid, without further examination, in any public school of the State.

Upon a kindred report on the above subjects through English literature, a limited certificate is issued, valid, as above, for five years.

No fee is charged.

The normal school board diplomas, granted in testimony of scholarship and ability to teach, and indorsed by the State superintendent, after one year's experience in the schools of the State; diplomas of graduates of the State University or of any incorporated institution in the State with courses of study equivalent to the corresponding courses in the university, similarly indorsed after sixteen months' like experience; diplomas of graduates of the State University, with indorsement showing completion of the full course of pedagogy, similarly indorsed, after eight months' like experience—have the force of unlimited State certificates.

A normal certificate of completion of the elementary course and qualifications to teach, countersigned by the State superintendent, has the force of a limited State certificate.

The State certificates are subject to be annulled by the State superintendent after the accused have written copies of charges and opportunity for defense.

The county superintendent issues certificates of three grades: First, examination same as second, and higher algebra, natural philosophy, geometry; valid four years, but may be limited to one year. Second, examination same as third, and gram-

Digitized by Google

matical analysis, physical geography, elementary algebra; valid two years. Third, examination, common English branches, constitutions of the United States and Wisconsin, temperance, theory and art of teaching; valid not more than one year, and may be restricted to a town or a school.

Graduates of free high schools with diplomas showing their standing in each branch of study, a first-class certificate from the superintendent of the county of residence or graduation, and one year's experience may have four years' validity given to the certificate in any county by the countersignature of the superintendent thereof.

The county superintendent may annul certificates after at least ten days' written notice, including statement of charges and opportunity for defense.

WYOMING, 1895.—The (elected) superintendent of public instruction has power to grant certificates of qualification to teachers of proper learning and ability to teach in any public school and to regulate the grade of county certificates.

County superintendents are authorized to grant certificates to persons of the requisite ability and qualifications for two years or during their terms of office, or may renew a certificate previously given without reexamination.

Certain peculiarities are recapitulated below without comment on their value:

A careful reading will show where the temperance examination is obligatory. The effect of cigarettes is specifically a subject of examination in Tennessee, and that of tobacco in Texas.

Licenses are invalid after an interval not spent in school work:

In the District of Columbia, after an interval of one year out of service of the board, unless under leave of absence.

In Indiana, a permanent county certificate after failing to teach a full school year in any year.

In Kansas, Nebraska, North Dakota, and Virginia, life license after three years.

In Kentucky, life license after two years.

In Texas, permanent county certificates after three years; first grade, after two years.

In Utah, life license after five years.

In Arkansas belief in a Supreme Being is a prerequisite for a license.

In Arkansas, one of the States where all rural land titles are in terms of the national survey, ability to read the land descriptions according to that survey is a subject of examination, and a teacher failing to teach the same is under penalty of revocation of his license.

Failure to teach the temperance lessons is specifically punishable:

In Colorado by removal from office of any officer or teacher under whose jurisdiction it occurs.

In Iowa by revocation of the license of the teacher and debarment from teaching for one year.

In North Dakota and in Ohio by revocation of license.

In Pennsylvania any school committee or board of control for any institution wholly or in part maintained by public funds forfeits its share of appropriations from the Commonwealth.

In New Hampshire primary schools are exempt from the obligatory temperance lessons.

The town committee in Connecticut, Maine, Massachusetts, and New Hampshire satisfies itself of the qualifications of teachers, accepting, in its option, State certificates or normal diplomas in lieu of examination.

Digitized by Google

In Illinois the law requires districts of a thousand population to hold supplemental examinations, but there is no penalty for failure, and in practice the county or the State certificate, necessary for drawing public money, is accepted as adequate.

In Michigan the fee for county examinations of women is one-half as much as that for men.

In Oregon the fee for temporary emergency certificates is two and one-half times that of regular public examinations.

In Mississippi the county superintendent has the power of a justice of the peace to issue subpœnas for witnesses for inquiry or trial.

In Missouri charges against teachers must be submitted in writing, signed by the accuser.

In New York the authorization of normal classes in all cities employing superintendents and the requirements for appointment as teachers in such schools deserve close attention as bringing all schools of the considerable towns or cities of the State under the influence of a plan not before of more than a temporary or local operation elsewhere in the country.

CHAPTER XXXVI.

CURRENT QUESTIONS.

Contents.—Coeducation—Higher commercial education in Europe—Compulsory attendance—The conveyance of children to school—Corporal punishment—Foreigners in universities of Europe—Superintendents and teachers' salaries—Sunday-school statistics—Supplementary and industrial education in Germany—Teachers' pensions and mutual aid societies—Temperance instruction.

COEDUCATION.

Coeducation, or the education of boys and girls in the same classes, is the general practice in the elementary schools of the United States. Exceptions to this rule are found in a few cities—less, apparently, than 6 per cent of the total number. In the majority of these cities the separation of boys and girls has arisen from the position or original arrangement of buildings, and is likely to be discontinued under more favorable conditions. Of the 50 principal cities enumerated by the census of 1890, 4—namely, Philadelphia, Pa.; Newark, N. J.; Providence, R. I., and Atlanta, Ga.—report separation of the sexes in the high schools only; 2 cities of this class—San Francisco, Cal., and Wilmington, Del.—reported, in 1892, separation in all grades above the primary. In 6 cities—New York and Brooklyn, N. Y.; Boston, Mass.; Baltimore, Md.; Washington, D. C., and Louisville, Ky.—both separate and mixed classes are found in all grades. Five cities of the second class having a population of 8,000 or more report separation of the sexes in the high schools, and 10 cities of the same group separate classes in other grades. Of cities whose population is less than 8,000, 9 report separate classes for boys and girls in some grades.

Coeducation is the policy in about two-thirds of the total number of private schools reporting to this Bureau and in 65 per cent of the colleges and universities.

Since the issue of the last Report Cumberland University, Lebanon, Tenn., has opened its classes to women, and the University of North Carolina has admitted women to its graduate courses on the same conditions as men. Women are now admitted to all the higher courses of this university, and may be enrolled in the regular junior and senior classes as candidates for undergraduate degrees.

Foreign countries.—In England 65 per cent of the departments into which the elementary schools are divided have boys and girls in the same classes; in Scotland, 97 per cent. Statistics for Ireland show that 51 per cent of the national schools have a mixed attendance of boys and girls.

Separate education is the general policy in English schools of secondary grade, and where both sexes are admitted to the same school it is generally to separate departments. It is noticeable that the royal commission on secondary education advocate the extension of the coeducational policy, and since the publication of their report experiments in this direction have noticeably increased.

In the British colonies, with very few exceptions, both mixed and separate schools are found. In Ontario all the schools are mixed. In Quebec the schools for English children are, as a rule, mixed, but in those for the French the sexes are separated. In the Australasian colonies the tendency to separate departments for boys and girls is noticeable in cities. In Cape Colony, while nearly all schools are mixed, separate schools for girls are encouraged.

In France custom and sentiment favor the separate education of boys and girls and the law requires every commune having above 500 inhabitants to establish a separate school for girls unless specially authorized to substitute therefor a mixed school. The attendance upon mixed schools slightly increased during the last decade, but not enough to indicate any decided change of sentiment in this respect. The mixed schools are seldom found in cities.

The department of the Seine, which is occupied by Paris and its environs, reported in 1891–92 for public schools only 0.2 per cent of the pupils enrolled in mixed schools and for private schools 9.2 per cent.

Digitized by Google

In secondary schools, public and private, separate education is the universal rule.

Germany.—Separate education is the preferred policy in the German States, but is not practicable in the rural primary schools. According to statistics of 1891, in Prussia two-thirds of the children in the common schools were in mixed classes, but in the cities the proportion was only three-tenths. In Saxony only the two lowest classes are mixed, so that separation occurs generally at the tenth year of age—always by the twelfth.

Other continental countries.—Similar conditions prevail in the remaining countries of Europe, the tendency toward separation being most strongly marked in the Catholic countries. In Italy the law calls for separate schools for boys and girls, and if they attend at the same building it must be in separate departments, each provided with its own entrance door. The lowest classes, however, may be, and often are, mixed.

In Norway, and to a less extent in Denmark, girls are securing admission to secondary schools formerly reserved for boys.

The South American republics follow the precedent of the Latin States of Europe. Brazil, like Italy, requires separate schools for the two sexes. In 1888 the experiment of admitting boys and girls to the same class rooms was made in a few schools, but they were seated in different rooms outside of recitation hours.

Coeducation in the universities of Europe.—The adverse vote of the senate of Cambridge University upon the proposition to admit women to the university degrees fixes for the present the status of women with respect to the two great English universities. The vote, which was taken May 21, 1897, stood 1,707 against to 661 for the resolution.

The university colleges established in England since 1868 are open to men and women. By the "universities act" of 1889 the Scotch universities were authorized to open their doors to women. Edinburgh admits them to the classes with men. Glasgow has affiliated Queen Margaret College for women, and more recently (1895) opened all lectures in the faculty of arts to women. The University College of Dundee, affiliated to St. Andrews, is coeducational.

In France women have never been legally deprived of university privileges, and since 1863, when the first woman was enrolled in the Paris faculties, the number of women matriculates has been gradually increasing.

The universities and secondary schools of Italy admit students of both sexes to the same class, a policy at variance with that pursued in the elementary schools.

Women have recently been admitted to courses in the universities of Germany, Austria, and Hungary, special authorization being required in each individual case.

The University of Athens was open to women in 1890.

HIGHER COMMERCIAL EDUCATION IN EUROPE.

The very great progress the natural sciences, technology, and transportation have made in recent years has given to the commercial profession an importance which could not be foreseen in former years. More than ever before has it become the merchant's duty to act as middleman between producer and consumer. In ever widening circles he has to bring the products of agriculture and industry to their proper markets. By means of increased taxation to which commercial enterprises are subject they support ever more strongly the State in the discharge of its civilizing efforts. Direct exchange between producer and consumer has almost wholly ceased, and the percentage of the population devoted to commercial pursuits has increased considerably in every civilized country.

It seems worthy of mention that at present the governments everywhere in Europe are urged strongly by commercial men to establish more higher commercial schools and support them exclusively from state funds. It is argued that the state provides higher technological, industrial, agricultural, forestry, and mining academies for leaders in technical pursuits, agriculture, etc., while for the mercantile branch no state institution exists. The merchants feel that the education of their assistants is not of such a high order as that of the members of other callings, and they attribute it to the want of institutions of a high order. At present the commercial branch is entirely dependent for the best preparation of its members upon higher schools established by local authority or private enterprise—institutions which charge high tuition fees, hence are attended by wealthy young men only. This opinion has found expression in legislatures and parliaments, where it was urged that much greater demands are made now than

Digitized by Google

formerly, owing to freer commercial movement all over the civilized world, and it would therefore seem wise if the state authorities paid more attention to proper preparation of men who might become leaders in commerce, as the state prepares leaders in every other field of human exertion.

Moved by these considerations, several European governments have of late years bestowed much attention upon commercial training of young men, and the results thus far obtained give assurance that the further development of schools for that purpose will be commensurate with the demands of the times.

In Germany particularly the commercial secondary schools have developed, with the aid of provincial and state support, till at last a university has opened its doors for higher commercial education. On February 22, 1898, the University of Leipsic received an addition to its various courses in the shape of a higher commercial course. The particulars may be found on page 1498 of the Annual Report of the Commissioner of Education, 1896–97. Another independent commercial university is to be opened in Rhenish Prussia, and still another at Magdeburg. These higher seats of learning are to be distinguished from other commercial schools by their making knowledge of commercial practice a condition of admission and confining themselves to the domain of commercial sciences exclusively. It is intended to require professional consuls to be graduates of such commercial universities in future. In Italy the state subsidizes the higher commercial school at Venice, reserving the privilege of having its consuls and consular agents prepared at that school. In Belgium the Government chooses its consuls from the graduates of the higher commercial schools at Antwerp.

The Department of State has received the following from the Italian embassy, dated Washington, January 2, 1899:

"The international congress for commercial instruction will meet at Venice and will remain in session from the 4th to the 8th of May next, at the palace of the Royal Commercial High School. Its object will be to continue the studies initiated at its preceding meetings held at Bordeaux (1885–86), London (1897), and Antwerp (1898).

"In the next congress, of which the minister of foreign affairs, the minister of commerce, and the minister of public instruction of the Kingdom have been made honorary presidents by the committee of arrangements, the most prominent foreigners who make a special study of commercial matters will take part, and many gentlemen of high repute in trade and manufactures have already consented to participate.

"It is now desired to secure the adhesion to the congress of foreign governments and the participation of their representatives, in order that the work of the preceding meetings may, in that of next year, yield the fruits that are expected of it and reach those authoritative conclusions which progress in this wide field requires.

"In pursuance of the instructions which I have received from my Government, I have the honor to invite the United States Government to take part in the aforesaid congress, and to send, as its representatives, such special delegates as, owing to their competency, may contribute to the success of the labors of that body."

COMPULSORY ATTENDANCE.

The enforcement of compulsory laws is widely variable. The law of Ohio is expressly inoperative where seating accommodations at school are inadequate, and, without formal expression, a similar condition practically prevails where population is in advance of school accommodations. In general, the laws are most fully enforced in the older, well-established communities, while partially settled States, rapidly growing cities, and what may be called the frontier parts of old States, find occasion for freedom from rigid rules. Thus in Massachusetts the four counties formed of Cape Cod, the large coast islands, and the hilly west end of the State are exempt from the requirement upon all other counties to support county truant schools, singly or jointly.

Thirty States, one Territory, and the District of Columbia have laws making attendance at school obligatory in prescribed conditions. The table following shows the general outline of designated ages, time of required attendance, and penalties upon parents or those in their stead for neglect. Some of the variations from absolute requirements are explained in notes upon the table; others, inconvenient for such brief explanation, are indicated here.

Ages for attendance under penalty for failure will be seen to vary from a minimum of 7 years to a maximum of 16 years. The prevalent limits are 8 to 14 years. The minimum period of attendance varies from eight weeks in Kentucky to the

Digitized by Google

full term taught in the year in Massachusetts and Connecticut. There are conditional requirements involving years of age or periods at school, according to attainments or occupation of the child, as explained below.

It may be seen by the table that the possible penalties upon the parent for neglect to send the child to school vary from a minimum of $1 in New Mexico to a maximum of $200 for repeated neglect in Nevada.

In some cases imprisonment is an alternative, or as an additional penalty, from two days to three months, or in the indefinite form of committal till fine is paid. There are also penalties upon parents for false statements as to age or attendance of children: Massachusets, as to a minor over 5 years of age, not exceeding $50; Kentucky, $5 to $20; Illinois, $3 to $20 and costs.

Besides penalties upon the parent, there are penalties upon the child and penalties upon an officer, including, in certain cases, the teacher. States are named so far as necessary in this text, without tabulation in the general order of the table to follow.

Ultimate penalty upon a child.—Maine, sent to reform school, if 10 to 15 years of age; New Hampshire, sent to industrial school; Massachusetts, boy, 7 to 16 years of age, to county truant school, or, if idle in public places, to the Lyman School for Boys; girl, to State Industrial School for Girls, at cost of parent or of county, as determined by the committing magistrate; Rhode Island, to any institution designated or provided under authority given town and city councils; Connecticut, to local or State reformatory; New York, to a truant school provided under authority given any school board, if guilty of truancy only; New Jersey, to juvenile reformatory, if over 9 years of age, reaching also habitual truants till 15 years of age if wandering in public places; Pennsylvania, to local truant school provided under authority given any school board; Ohio, to local or other reformatory; Indiana, to parental home, provided under authority given any school board, if under 12 years of age; Michigan, to ungraded school provided under authority given any board maintaining graded schools if ordinary truant, to industrial home if persistent truant; Utah, to reform school.

Penalty upon neglectful officer.—Maine, $10 to $50, as also upon a town neglecting to elect a truant officer; Vermont, not exceeding $100; Pennsylvania, principal teacher, $2 to $25; West Virginia, trustee and teacher for not informing, $5; Kentucky, trustee or president of board neglecting to prosecute within ten days after written notice by a taxpayer, $10 to $50; Ohio, officer, teacher, person neglecting duty, $25 to $50, and in addition, for subsequent offense, imprisonment ten to thirty days; Wisconsin, director, president of board, or truant officer neglecting to prosecute within fifteen days after written notice by local elector or taxpayer, $10 to $20; Minnesota, director or president of board neglecting to prosecute within ten days after written notice by a taxpayer, $20 to $50; North Dakota, president of board neglecting to prosecute within fifteen days after written notice by a taxpayer, $5 to $20; South Dakota, school officer failing in duty, $10 to $20; Kansas, same as Minnesota; Montana, district clerk failing to furnish the school board with a list of all children 8 to 14 years of age in attendance at school within twenty days of the opening of each school term, $5 to $25; trustee neglecting to prosecute within ten days of receiving the lists, $10 to $50; California, clerk of board failing to prosecute within ten days of written notice by a taxpayer, $20 to $50; any person failing in duty, first, $20; subsequently, $20 to $50.

While there is a general uniformity in excusing children from attendance for mental or physical conditions, certain States explicitly make compulsory regulations for attendance at special institutions by those for whom such institutions have been established.

It will be seen that some States require children to be instructed without rigid stress upon the mode of instruction, while others require attendance at a public school, to be excused only by local officers.

It will be seen that in certain States the provision for reaching delinquents seems to reach those only who have come within the teacher's view, while in other States provision is made to bring the name of every resident child before the authorities, with his record.

There is a penalty, not exceeding $50, in Massachusetts upon anyone who attempts to induce a child to absent himself, or who harbors or employs him while school is in session.

The compulsory law applies to special classes as follows:

Ohio.—Children entitled to attend school at the institution for the deaf and dumb or that for the blind. Truant officers report those 8 to 18 years of age to the respective probate judges, who set times for hearings to decide upon disposition of the cases.

Digitized by Google

North Dakota.—Any deaf child 7 to 21 years of age must be sent to the school for the deaf at Devils Lake at least eight months in each year, subject to the same excuses as a normal child, except distance.

Washington.—Deaf-mute, blind, or feeble-minded 6 to 21 years of age must all be sent to Washington school for defective youth at county expense when parents are unable to bear expense, under penalty of $50 to $200, adjudged by any justice of the peace or superior court if failure is without "a proper cause."

California.—All resident deaf, dumb, or blind 6 to 21 years of age must be sent to the State institution for gratuitous instruction for a period of not less than five years.

The requirements are to attend—

School: Wyoming, Washington.

A public school: Maine, New Hampshire, Massachusetts (day), Rhode Island (day), Connecticut (day), New Jersey (day), West Virginia, California.

A day school where common branches are taught in English: Pennsylvania.

Public or private school: Wisconsin, Nebraska, New Mexico, Utah (in the district where one resides), Minnesota (taught by competent instructor), Kansas, Montana, Colorado (the last three with the same proviso as Minnesota).

Public or private day or night school: Kentucky.

Public or private or parochial school: Ohio.

Excuses, to a degree, develop as defenses upon prosecution, but excuses guard against action as follows:

Excuse of local board: New Jersey, Pennsylvania, Kentucky, Michigan, Minnesota, Nebraska, Montana, Wyoming, Colorado, Utah, Nevada, Idaho, California.

Excuse of superintendent, clerk of board, principal of public, private, or parochial school: Ohio.

Prescribed exemptions are:

Distance from school: California, 1 mile; Pennsylvania, Kentucky, West Virginia, Indiana, Michigan, Wisconsin, Minnesota, Kansas, Colorado, Nevada, Oregon, 2 miles; North Dakota, Montana, Utah, 2½ miles; Idaho, 3 miles.

For bodily or mental conditions requiring exemptions: All except Washington, in which defective children must be sent to State institutions, and Indiana, North Dakota, Montana, Wyoming, New Mexico, Utah, each requiring a physician's certificate regularly or at will.

For other instruction, like period and like quality: Maine, Vermont, Massachusetts, Rhode Island, Connecticut (requiring hours, terms, and studies of public school, no school acceptable unless open to usual public inspection and making public reports, except as to expenses), New York, New Jersey (at school or at home by competent instructor), Pennsylvania, Kentucky (subject to such examination as other children of the district), West Virginia, Ohio (at home by competent instructor), Illinois, Michigan, Wisconsin, Minnesota, Kansas (subject to examination as in Kentucky), Montana, Colorado (subject to examination as in Kentucky), Utah (times and studies of public school), Nevada, Idaho, Oregon, California.

For instruction at private school: New Hampshire, Rhode Island (school approved by board), North Dakota (like Rhode Island), South Dakota (like Rhode Island), Utah.

For instruction at any other school: District of Columbia.

For acquirements: Vermont, Massachusetts, Rhode Island, West Virginia, Kentucky, Indiana (eight years' work of common schools and certificate of graduation therefrom), Michigan, Wisconsin, Minnesota, North Dakota, South Dakota, Nebraska, Kansas, Montana, Utah, Nevada, Idaho, Oregon, California.

Inability to send: District of Columbia.

Poverty and inability to send: Nebraska.

Poverty and lack of suitable clothing: Rhode Island, Kentucky, Minnesota, Kansas, Montana.

Parents extremely poor or sick: California.

Service necessary to support of mother or invalid father: Utah.

Service necessary to support of aged or infirm relative: Illinois.

Urgent reasons: Pennsylvania.

When attendance would work great hardship: Wyoming.

Decision of court of record: Illinois, Wisconsin.

Decision of probate judge on appeal: Ohio.

Clothing is furnished in case of poverty to enable children to attend school as follows: Vermont, by the town; Indiana, by the county; Colorado, by the district.

There are truant officers: Maine—one or more elected in a town or a city; New Hampshire—optional, elected by school board; Vermont—two in each town or city

Digitized by Google

appointed by selectmen or mayor; Massachusetts—one or more appointed by the school committee in every town or city; Rhode Island—one or more special constables appointed by each town council or board of aldermen; Connecticut—police, sheriffs, and constables, and, when appointed by selectmen as special constables, school committee and janitors of school buildings; New York—one or more, called attendance officers, appointed by school authorities of each city or school district; New Jersey—in each city one or more detailed by police authorities, in each district without police one or more constables detailed by school authorities; Pennsylvania—one or more, called attendance officers, employed by school boards in each city, at option in each borough and township; Ohio—one or more employed by board of education in each city, in each other district a constable or other person appointed by board of education; Indiana—not exceeding five for each county appointed for districts composed of townships by the county superintendent, one or more for each city and incorporated town appointed by the school superintendent together with the secretary of the State board of charities, and one member of the State board of education designated by that board; Illinois—one or more appointed by each school board; Michigan—similar to New Jersey; Wisconsin—optional, one or more appointed in each city and district by the local school board; South Dakota—the president or chairman of each school board is charged with the duties; Montana—optional, for every district of 2,000 population one appointed by school board; Wyoming—sheriffs, constables, police officers.

In Pennsylvania the assessor at the spring registration of voters makes a list of all children of school age, which he gives to the school board; the secretary of the school board gives a list to the principal teacher of each school; the teacher reports monthly the names of those absent in the past month five days unexcused.

In Ohio the principal of each public, private, and parochial school reports in the first week of each September, December, February, April, the names, ages, and residences of all pupils in attendance at their schools to the clerk of the school board, and reports cases of truancy or incorrigibility as soon as practicable after occurrence to the truant officer.

In Montana the district clerk must furnish the school board with a list of all children 8 to 14 years of age in attendance at school within twenty days of the commencement of the term.

In Nevada the school board must furnish the principal teacher of each public school, by the first Monday of each September, with a list of all resident children 8 to 14 years of age, taken from the report of the school census marshal. At the beginning of each succeeding school month the teacher must report to the board the names of all attending during the past month. At the expiration of four school months the board shall make demand upon a delinquent parent for the prescribed penalty, and, in case of neglect for five days to pay it, to institute suit for its recovery.

In Idaho provisions are like those just cited for Nevada, except that the period before demanding penalty is three months.

The actionable offense is variously defined. In some States, particularly where there are truant officers, procedure is peremptory when children are found absent from school and unemployed. In Connecticut each week's failure to comply with the law, and in West Virginia a failure to send for five consecutive days is a distinct offense. In Nevada upon the expiration of four months without duly sending the child to school demand is made upon the parent for the penalty. In Idaho a like demand is made after three months of neglect.

CHILD-LABOR LAWS AND FACTORY LAWS.

Child-labor laws and factory laws, as variously designated, are closely related to compulsory education laws, and in general provide against the employment of children of specified ages with or without a proviso as to the amount of their school attendance.

In New Hampshire no child under 10 years of age must be employed in a manufacturing establishment, nor anyone under 16, who can not read and write, during the time school is in session, nor without a certificate of attendance in the past year of twelve weeks if 14 to 16; of six months if 12 to 14; of the whole term if 10 to 12 years of age. Penalty on owner or agent employing, not exceeding $50.

In Vermont no child under 14 years of age is to be employed in a mill or factory unless with a certificate from the teacher of attendance at public school for twenty weeks during the preceding year. Nor shall anyone employ a child under 14 who can not read or write, but is capable of receiving such instruction during the time when the public school which he should attend is in session. Penalty on parent, guardian, or master violating the law, $5 to $25.

Digitized by Google

In Massachusetts no child under 14 years of age must be employed in any factory, workshop, or mercantile establishment. No such child must be employed for wages at any employment during the hours of public school in the city or town, nor at any work before 6 o'clock in the morning nor after 7 o'clock in the evening. No child under 16 must be employed without certificate of age and school attendance, nor any minor over 14, who can not read and write English, while a local evening school is maintained unless he attends the same. Penalties upon employers and parents offending or neglecting the law or making false statements, various, between $5 and $50.

In Rhode Island no child under 12 years of age is to be employed in any factory, manufacturing, or mercantile establishment. No child 12 to 15 years of age is to be employed as above or by any telegraph or telephone company except during vacations of the local public schools, unless during the next preceding twelve months he has attended school eighty full days or acquired the prescribed branches or been excused by the committee and supplied with a certificate. Employers or parents offending or permitting the offense are fined not exceeding $20.

In Connecticut no child under 14 years of age is to be employed in any mechanical, mercantile, or manufacturing establishment. No child under 14 resident for nine months in the United States shall be employed to labor without a certificate of attendance in the public schools for at least sixty days in the twelve months preceding. Penalty on employer or on parent making false certificate of age not more than $60. Any parent making false statement as to age of child shall be fined not exceeding $7 or imprisoned not exceeding thirty days.

In New York it is unlawful for any person, firm, or corporation to employ any child 8 to 12 years of age in any business or service whatever during any part of the term during which the local public schools are in session, nor any child 12 to 14 without a certificate of attendance of eighty days in the current year, under penalty of $50.

In New Jersey no child under 15 years of age is to be employed by any person, company, or corporation to labor in any business whatever unless he has attended some public day or night school or some well-recognized private school at least five days or evenings every week for at least twelve consecutive weeks or two terms of six consecutive weeks each, under penalty, upon any parent or other person offending, of $10 to $25, or imprisonment one to three months.

In Ohio no child under 14 years of age is to be employed by any person, company, or corporation during the school term and while the local public schools are in session without certificate of twenty or sixteen weeks' attendance at school (the greater number for town or city districts) in the year, under penalty of $25 to $50.

In Illinois no person, firm, or corporation shall employ any child under the age of 13 years in any store, shop, factory, or manufacturing establishment by the day or for any period of time greater than one day without a certificate authorizing employment for dependence of an aged or infirm relative issued by the school board. No child is to be permitted to work in one's employ, as above, without the certificate. The law seems to contemplate liberty to work on Saturday, and yet a strict interpretation of the prohibition to allow the service without the certificate would prevent work on that day. Penalty upon the employer and upon any father who permits the employment, $10 to $50. Every day of such employment is to be counted as a separate offense.

In Michigan no child under 14 years of age is to be employed by any person, company, or corporation to labor in any business without attendance at some public or private day school under a qualified teacher at least four of the twelve months preceding the month of employment. Penalty on parent or other offender, $5 to $10 for first offense; not less than $10 for each subsequent offense.

In North Dakota no child 8 to 14 years of age may be employed in any mine, factory, workshop, or mercantile establishment or, except by his parents or guardians, in any other manner during the hours when the local public schools are in session without a certificate of attendance of twelve weeks during the year or of due excuse. The employer will incur penalty of $20 to $50 and costs. A like penalty is upon any person authorized to sign the required certificate if he certifies to a materially false statement.

In South Dakota the law is like that of North Dakota, except that the penalties are $10 to $20.

Compulsory education—Requirements.

States.	Edition of law.	Age.	Annual period.	Penalty on parents. a
North Atlantic Division:				
Maine	1893	8-15	16 weeks; 2 terms of 8 weeks each, if practicable.	Not exceeding $25.
New Hampshire	1895	8-16	12 weeks, 6 consecutive	First, $10; subsequent, $20.
Vermont	1893	8-14	20 weeks	$5 to $25.
Massachusetts	1898	b 7-14	Full term	Not exceeding $20.
Rhode Island	1896	7-15	80 days and when unemployed.	Do.
Connecticut	1898	c 8-16	Full term	Not exceeding $5.
New York	1896	8-16	14 to 16 unemployed, and 8 to 12 full term, Oct. 1 to June 1, 12 to 14, 80 days.	First, not exceeding $5; subsequent, not exceeding $50, or imprisonment not exceeding 30 days, or both fine and imprisonment.
New Jersey	1895	a 7-12	20 weeks, 8 consecutive	$10 to $25, or imprisonment 1 to 3 months.
Pennsylvania	1897	d 8-16	70 per cent of the term	First, not exceeding $2; subsequent, not exceeding $5.
South Atlantic Division:				
Dist. of Columbia	1873	8-14	12 weeks, 6 consecutive	Not exceeding $20.
West Virginia	1897	8-14	16 weeks	First, $2; subsequent, $5.
South Central Division:				
Kentucky	1896	7-14	8 consecutive weeks	First, $5 to $20; subsequent, $10 to $50.
North Central Division:				
Ohio	1897	e 8-14	20 weeks, 10 consecutive, city; 16 weeks, 8 consecutive, other districts.	$5 to $20, or penal bond of $100; on refusal, imprisonment 10 to 30 days
Indiana	1897	8-14	12 consecutive weeks	$10 to $50 and, in discretion of court, imprisonment 2 to 90 days.
Illinois	1897	7-14	16 weeks, 12 consecutive	$1 to $5 and costs, and stand committed till paid.
Michigan	1893	f 8-14	16 weeks, 6 consecutive	First, $5 to $10; subsequent, not less than $10; incorrigible, $10 to $20, or penal bond of $100.
Wisconsin	1898	7-13	12 weeks	$3 to $20.
Minnesota	1897	8-16	12 weeks, 6 consecutive	First, $25; subsequent, $25 to $50.
North Dakota	1896	8-14	do	First, $5 to $20; subsequent, $10 to $50, with costs.
South Dakota	1897	8-14	do	$10 to $20 and costs, and stand committed till paid.
Nebraska	1897	8-14	12 weeks	$10 to $50.
Kansas	1897	8-14	12 weeks, 6 consecutive	First, $5 to $10; subsequent, $10 to $20.
Western Division:				
Montana	1895	8-14	do	$5 to $25.
Wyoming	1895	g 6-21	12 weeks	Not exceeding $25.
Colorado	1893	8-14	12 weeks, 8 consecutive	$5 to $25.
New Mexico	1895	8-16	12 weeks	$1 to $25, or imprisonment not exceeding 10 days.
Utah	1896	8-14	20 weeks, 10 consecutive	First, not exceeding $10; subsequent, not exceeding $30, with costs.
Nevada	1897	8-14	16 weeks, 8 consecutive	First, $50 to $100; subsequent, $100 to $200, with costs.
Idaho	1897	8-14	12 weeks, 8 consecutive	First, not less than $5; subsequent, $10 to $50, with costs.
Washington	1893	a 8-15	12 weeks	$10 to $25; defective children, $50 to $200.
Oregon	1893	8-14	12 weeks, 12 consecutive	First, $5 to $25; subsequent, $25 to $50, with costs.
California	1895	8-14	Two-thirds of full term, 12 weeks consecutive.	First, not exceeding $20; subsequent, $20 to $50, with costs.

a See preceding text.
b To 16, if wandering about public places without lawful occupation, growing up in idleness and ignorance.
c Not applicable to children over 14, lawfully employed and not enrolled at school.
d Not applicable to children over 13, regularly engaged in useful service.
e 14 to 16, if unable to read and write English, till able; also if wandering about public places without lawful occupation.
f To 16, if frequenting public places without lawful occupation.
g Penalty only for child 7 to 16, or one living idly and loitering about public thoroughfares and spending its time in an idle and dissolute manner.

Digitized by Google

The official publication of laws in any State is usually delayed beyond the adjournment of the legislature, so that complete accuracy to the date of publication of the above table can not be assured.

The column entitled "Edition of law used" has its value in fixing the time at which the law is known by the Bureau of Education to have been published. In some States annual editions, in others biennial editions, in others editions at irregular intervals, as required by convenience and by changes in legislation, are issued, while in the extreme case of the District of Columbia no compilation of school laws is published, the provisions being distributed through various volumes of United States Revised Statutes, or legalized by recognition in current appropriation bills.

THE CONVEYANCE OF CHILDREN TO SCHOOL.

The following States have made legal provision for transporting children to school at the public expense: Maine, New Hampshire, Vermont, Massachusetts, Connecticut, New York, New Jersey, Iowa, North Dakota, and Nebraska.

The State superintendents of Rhode Island and Wisconsin have declared that the existing provisions of the school laws of their respective States are sufficient to authorize the conveyance of pupils at the public expense. Certain counties of Ohio are authorized by special laws to establish central schools and convey pupils to and from them, and excellent results have followed the adoption of this policy.

Some progress has also been made in this direction in Pennsylvania and South Dakota, and perhaps in other States, where there already exists, as in Pennsylvania, "law enough to cover the case."

For discussions of this subject, statements of advantages and disadvantages, results of experience, etc., see Reports of this office, for 1894–95, volume 2, pages 1469–1482; 1895–96, volume 2, pages 1353–1358.

Amount expended in Massachusetts for transporting children to school for the past nine years.

Year.	Percentage of increase.	Sum expended.	Year.	Percentage of increase.	Sum expended.
1888–89		$22,118.38	1893–94	0.26	$63,617.68
1889–90	0.09	24,145.12	1894–95	.19	76,608.29
1890–91	.27	30,648.68	1895–96	.16	91,136.11
1891–92	.26	38,726.07	1896–97	.12	105,317.13
1892–93	.31	50,590.41	1897–98		

CORPORAL PUNISHMENT.

There is little change in legal conditions as to corporal punishment since the summary last printed (p. 1537, Report of 1896–97).

Arizona has dropped the enactment expressly authorizing corporal punishment. Suspension by the teacher, expulsion by the board of trustees, with liabilities of parents for damage to property, are the extreme measures expressed in the edition of its school law for 1897.

The following extract from the penal code of New York is given in the consolidated school law, edition of 1898: "To use or attempt or offer to use force or violence upon or toward the person of another is not unlawful in the following cases:

"4. When committed by a parent or the authorized agent of any parent or by any guardian, master, or teacher in the exercise of a lawful authority to restrain or convict his child, ward, apprentice, or scholar, and the force or violence used is reasonable in amount and moderate in degree;"

In one entire State (New Jersey) the teacher is forbidden by law to inflict corporal punishment. No other State goes to this length, but Illinois, Kansas, Mississippi, Montana, Pennsylvania, South Dakota, Washington, and West Virginia specifically prescribe a penalty for excess amounting to cruelty. Legal punishment would be meted out to a brutal teacher in the other States just as surely as in these, but resort would be had to the common law and not to a statute. Corporal punishment, in some form of whipping, has been the common mode of discipline in school from time immemorial; custom legalizes it, and unless forbidden in express terms the teacher does not need the authority of a special permissive law. Judicial decisions to this effect have been made in Alabama, Arkansas, Con-

Digitized by Google

necticut, Indiana, Iowa, Maine, Minnesota, North Carolina, Pennsylvania, Wisconsin, and probably in other States.

Local school boards have always the implied power to make regulations for the order and discipline of their respective schools, and three States, viz, Michigan, New York, and Pennsylvania, expressly grant them this power. Acting under this power, expressed or implied, several cities, notably New York City, Chicago, and Albany, have prohibited absolutely the use of the rod. The same is true of Providence, R. I., except in the primary grades, and in them whipping must not be inflicted unless the written consent of the parent or guardian has been previously filed with the city superintendent.

Corporal punishment may be used as a last resort and under rigid regulations as to reports, etc., in a great many cities, among them being Baltimore, Detroit, Indianapolis, Louisville, Minneapolis, New Orleans, Pittsburg, Rochester, St. Louis, San Francisco, and Worcester. In some cities where there is no formal prohibition, such a strong sentiment has grown up against corporal punishment that it is rarely or never inflicted. Philadelphia is a conspicuous example of this.

FOREIGNERS IN UNIVERSITIES OF EUROPE.

The number of foreigners studying in Germany is considerable. It must be borne in mind, however, that the numbers given below represent only those of matriculated students, for those are the only ones who can be considered in official reports. The number of foreigners who visit German institutions as hearers for some length of time, and, without being matriculated, attend clinics, work in laboratories, and listen to private lectures is very large, but can not be stated with accuracy; it is estimated that the number of these exceeds the matriculated foreigners. Especially Americans are found among these "hearers," chiefly because their preparatory schools are not patterned after the model of the German classical high school, hence their graduation diploma does not entitle them to matriculation in German universities. American students preferably attend Jena, Leipsic, Heidelberg, and Berlin, owing to the pedagogical seminaries at these universities. In the summer of 1895 the universities and other institutions of learning in Germany had upon their rolls the names of 3,362 foreigners, that is, 8.48 per cent of the total number of matriculated students. Of these 3,362 foreigners the universities proper had 2,015 (7 per cent), the polytechnica 1,041 (13.1 per cent), the veterinary schools 15 (1.53 per cent), the agricultural academies 101 (9.37 per cent), the forestry academies 58 (18.6 per cent), and the mining academies 132 (32.4 per cent). Of the 3,362 foreigners 966 were Russians, 514 Americans, 467 Austrians and Hungarians, 346 Swiss, 180 Englishmen, 158 Hollanders, 142 Bulgarians, 116 Swedes and Norwegians, 82 Roumanians, 69 Italians, 57 Asiatic, 53 Frenchmen, 37 Servians, 36 Belgians, 36 Turks, 27 Greeks, 26 Danes, 22 Africans, 14 Australians, 8 Spaniards, 4 Portuguese, and 2 Montenegrins.

In the Austrian universities and other institutions there were matriculated 1,106 foreigners in the summer of 1895 among a total of 18,031 students, or 6.14 per cent. Of these 1,106 foreigners there were 987 (6.58 per cent) students of universities, the polytechnica had 84 (3.1 per cent), the mining academies 16 (7 per cent), and the agricultural academy in Vienna had 19 (7.66 per cent). The 1,106 foreigners consisted of 239 Germans, 236 Russians, 115 Servians, 111 Italians, 105 Americans, 76 Roumanians, 71 Bulgarians, 33 Turks, 31 Englishmen, 25 Swiss, 11 Greeks, 10 Frenchmen, 9 Hollanders, 9 Swedes and Norwegians, 8 Africans, 6 Belgians, 6 Asiatics, 3 Spaniards, and 1 Montenegrin.

The Swiss higher seats of learning matriculated no less than 1,667 foreigners among a total of 3,908 students. The percentage of foreigners here was 42.6. The universities alone enrolled 1,341, or 42.2 per cent, and the polytechnical school in Zürich 326, or 43 per cent, of a total number of the matriculated students. Of the 1,667 foreigners Germany had sent 549, Russia 399, Austria-Hungary 143, Bulgaria 137, Roumania 86, Italy 68, America 65, France 63, Asia 26, Holland 25, Turkey 22, England 20, Greece 19, Servia 17, Sweden and Norway 15, Denmark 5, Belgium 3, Portugal 2, Africa 2, Spain 1.

From these summaries it is seen that as far as attendance of foreigners is concerned, Switzerland ranks first with 42.6 per cent of the total number; then follows Germany, with 8.48 per cent, and lastly Austria, with 6.14 per cent. This does not, as has been said before, include the so-called free lances who attend these higher seats of learning only for a time and who, being without proper preparation, can not matriculate, hence can not be counted as students by the officers of the institutions. They have, as a matter of fact, most of the privileges of the students by becoming the private students of renowned professors, and have access to the libraries, laboratories, experimental stations, and other accessories which are

Digitized by Google

open to those who can pay the fees. In Germany it is the mining academies which are, comparatively, attended most frequently by foreigners (33.4 per cent), and the veterinary schools are attended least by foreigners (1.53 per cent). The proportion of foreigners in German universities has risen from 5.16 per cent in the year 1880 to 8.48 per cent in 1895. In Austria the school of agriculture in Vienna has the greatest proportion of foreigners, namely, 7.66 per cent, while the polytechnica have only 3.1 per cent. In Switzerland universities and the polytechnical school are attended by foreigners at about an equal ratio.

In France efforts are being made to invite foreign students, especially from America, to attend the higher institutions of learning. Admission to these institutions has been made easier, and the academic degrees, which formerly were only given to French students, have been made accessible. A communication of the United States ambassador to France, Gen. Horace Porter, to the State Department, dated January 11, 1898, in answer to an inquiry in regard to the admission of a student from the United States into the School of Mines, contains statements which are applicable to other higher seats of learning also. He says:

"No foreign student can enter any of the schools of France—medicine, pharmacy, dentistry, veterinary, painting, design, architecture, music, declamation, engineering, etc.—without the formal application of the diplomatic representative of this country. In most cases two letters suffice, one making application, the other expressing thanks when the request is granted. Sometimes more correspondence is necessary, for the reason that those proposing to enter any of the high-grade schools have to produce certain certificates of studies or diplomas, which the authorities accept only when they come through the embassy. These rules, says General Porter, apply to all foreign students. No discrimination is made against Americans; on the contrary, the authorities extend all possible facilities to them. There is a large number of American students in Paris, and, as a rule, they are much liked by the teachers in French institutions.

"As for the School of Mines," he continues, "foreigners can be admitted there either as foreign pupils, in which case they have to stand an examination, or as free auditors, in which case there is no examination. The courses, however, are not all open to that class of students, and no diploma is granted them. In both cases they have to pay 50 francs ($9.65) for matriculation. If the school is full, as occasionally happens, the application for admission is put off until the next year."[1]

Students from the United States in the University of Paris, 1887–1898.[2]

a In this category are included all general supervising officers. It embraces those styled "assistant superintendents," "supervisors," "supervisors of high schools," "of grammar schools," "of primary schools," etc. For "supervising principals" and "principals" see the table of teachers' salaries.
b Supervisor of schools for the deaf.
c There are three supervisors at this salary.
d No information at hand as to salary.
e Director of French and German.
f With four assistants, at $800 each.
g There are two supervisors at this salary.
h Supervisors were employed in 1896-97, but not in 1897-98.
i There is also a supervisor of elementary science and a supervisor of nature study.
j Per month.
k The same person is supervisor of calisthenics and of music.
l Population of the entire city; District No. 1 embraces about three-fourths of it.
m There are four supervisors at this salary.
n Three-fifths of her time.

ADDENDA—STATISTICAL.

*Accurate reports made by State, Provincial, or Territorial association to the Eighth International Convention, Boston, Mass., June 23-26, 1896. (28.)
†Estimated reports made by State, Provincial, or Territorial association to the Eighth International Convention, Boston, Mass., June 23-26, 1896. (20.)
¶Reports made to the Seventh International Convention, St. Louis, Mo., August 31-September 2, 1893. (12.)

NOTE.—The report of the home department is mostly estimated by W. A. Duncan, Ph. D., although it is believed by the States and Provinces reporting that the figures here given are conservative. The report of the primary unions is compiled from the report of the secretary of the international primary union.

ORGANIZATION.

56 organized States, Provinces, and Territories (United States and Canada), printed in roman.
4 unorganized States, Provinces, and Territories, printed in *italics*.
19 States, Territories, and Provinces, where organization is thorough, printed in SMALL CAPS.
15 States, Territories, and Provinces, where organization is good, printed in **full-face roman.**
22 States, Territories, and Provinces, where organization is partial, printed in small roman.

SUPPLEMENTARY AND INDUSTRIAL EDUCATION IN GERMANY.

Continuation or supplementary schools (Fortbildungsschulen) in Germany are either day or evening schools; few are secular Sunday schools. Their object is to supplement the elementary education acquired in the common schools, and to bridge over the time from the fourteenth to the seventeenth year of age of boys who do not attend a high school or a secondary industrial or technological school, the law prohibiting factory or shop labor of children under 17 years. The continuation schools are essentially elementary schools, for as a rule they teach no foreign languages and no higher mathematics, hence can not be classed among secondary institutions.

There is very little, if any, uniformity in the courses of study in these schools. They adapt themselves readily to local needs, some being designed to aid agricultural, others industrial, communities. Nor are the educational authorities desirous of subjecting these schools to a uniformity such as is necessary for common schools, because, if anywhere, it is in these supplementary agencies of the people's education that the individuality of the pupils should be fostered and attempts be made to meet local needs.

There were in 1897 altogether 13,665 of such supplementary schools in the German Empire, attended by 484,644 pupils. The Kingdom of Prussia alone had 2,989 such schools, with 219,490 pupils. The necessity of maintaining supplementary schools varies in the different States. Thus, for instance, in Bavaria, where the school age is from 6 to 13 years, such supplementary schools are more necessary than in other States which keep the children in school a whole year longer. The number of pupils in supplementary schools to every 1,000 inhabitants varies from 57 in Bavaria and 50 in Würtemberg to 2 in Schaumburg-Lippe.

Several communities in German minor States have decreed compulsory attendance for pupils of continuation schools, which is enforced only where children are employed in factory and shop labor.

There has grown out of this system of supplementary schools a system of industrial and trade schools which is exerting a most beneficial influence upon the industrial development of the Empire. They are chiefly schools for the building trades, the weaving and dyeing trades, schools for metal workers, and all are more or less schools of design as well as schools for practical work. The State of Prussia has increased its appropriations for the maintenance of these trade schools from $213,484 in 1892 to $340,050 in 1897. Besides these sums the communities pay equal amounts, and private donations and contributions from trade unions swell the income to fully $1,000,000 a year.

Austria also maintains a large number of special schools of industrial character, as does Switzerland; but while in Austria and Germany the State governments support trade schools, the Federal Government in Switzerland can not do so, being prohibited by the Federal Government, which reserves education to the cantons.

TEACHERS' PENSIONS AND MUTUAL AID SOCIETIES.

In European countries in which the State supervises and directs the common schools and regulates the appointment of teachers, laws are in existence which provide for the teachers' support in old age, and even offer relief in cases of breakdown. But while in former years the pensions paid were to a large extent the result of premiums contributed annually by the teachers themselves, recent legislation in most States has done away with the teachers' contributions and laid the burden of paying pensions entirely upon the State. The argument advanced was that teachers, as servants or officers of the State, are entitled to pensions the same as all other civil or military officers. Furthermore, that teachers, among all the State's officers, are the ones who deserve the highest consideration, being the best of the State's agencies of conservation and the ones who are more likely to sacrifice their health in the discharge of their duties. Mutual aid societies and annuity funds established by teachers are therefore declining. The following summary gives the facts as far as known to this office:

Digitized by Google

Pensions paid to teachers of elementary schools in Europe.

Country or State.	Paid by State or community.	Dues paid by teachers, per cent of salary.	Pension may begin after—	Minimum amount paid, per cent of last salary.	Retirement takes place after—	Maximum amount paid, per cent of last salary.
German Empire:			*Years.*		*Years.*	
Prussia	Both	None	10	25	45	75 per cent.

Lübeck	Community	None	10	33⅓	35	75 per cent.
Hamburg	Community	None	10	40	40	80 per cent.
Alsace-Lorraine	State and community.	None	10	25	45	75 per cent.
Austria	Both	(*d*)	10	33⅓	40	100 per cent.
Hungary	Both	(?)	(?)	(?)	40	$150–$200.
Switzerland	(*e*)					
Denmark	Both	(?)	10	10	45	66⅔ per cent.
Norway	State *f*					
Sweden	State	None	(?)	(?)	30	75 per cent.
Netherlands	State	None	(?)	(?)	40	66⅔ per cent.
Belgium	Communities	8 per cent.	12	(?)	30	(?)
France	State	None	(?)	(?)	25	50 per cent.
Italy	State *g*	None	(?)	(?)	30	(?)
Great Britain	State	$15 + $1.25 for each 10 per cent of increase of salary.	10	(*h*)	35	$100 for each year after 10 years of service.

a In Bavaria the dues paid by teachers vary considerably in the different parts of the Kingdom—i. e., between $1.25 in central Franconia and $25 in lower Palatinate. Also initiation fees are paid.

b Lowest amount of salary.

c At pleasure of the Crown.

d In some crown lands of Austria dues are paid by teachers.

e In Switzerland the cantonal governments are, as a rule, opposed to pensioning teachers. Where it is done, it is the result of local agreement. The teachers themselves maintain annuity funds.

f In Norway pensions are paid to all teachers, but each case is individually decided by Parliament.

g In Italy the State pension fund is not large. Hence private annuity funds are numerous.

h See last column.

General notes.—The foregoing statements have reference to men teachers. Women teachers are retired, on an average, ten years earlier, and their pensions amount to about 10 to 20 per cent less than those of the men.

In most German States the communities (or the State) make a single relief payment if a teacher is disabled before he reaches the end of the tenth year of service—i. e., the lower age limit. The same practice prevails in Austria and a few other countries.

Great Britain	(*k*)	(*k*)	(*k*)	(*k*)	(*k*)	(*k*)

a In Würtemberg the pensions may reach 92½ per cent in cases where the salary is not higher than $600. The rate of increase is 1¼ per cent; as high as 85 per cent with salaries over $600. No pension can exceed $1,500.

b The population is not favorably inclined to paying pensions to teachers or other civil officers. Where it is done, it is the result of local agreement.

c In Denmark each case is decided by the minister of education, but usually according to the scheme indicated in the table.

d Each case is decided by Parliament.

e In the Netherlands the teacher pays one year's salary into the pension fund within the first five years of service.

f In Spain the State pays two-fifths of salary for two years after twenty years of service; three-fifths of salary after twenty-five years, and four-fifths of salary after thirty-five years of service, but only for two years.

g In Italy teachers may retire from service on account of ill health, and still draw one-half or three-fourths of their salaries, according to the length of service.

h In Greece an addition of one fiftieth of the salary is paid for each additional year of service, over and above the 40 per cent paid after twenty years.

i In Russia the pensions are not uniform; they range between 300 and 400 rubles after twenty-five years of service.

k In Great Britain a few distinguished schools, such as Eton, pay pensions; the majority of secondary schools being private institutions do not pay pensions to teachers.

In the United States no teachers are pensioned from public funds. Voluntary beneficial associations have been formed in some cities, and in other localities specified below. State laws provide for similar ends in a similar way, the essential difference being that in the latter case participation is enforced upon all teachers. The following paragraph shows the varieties of organization, etc.:

Voluntary mutual benefit associations for temporary aid only exist in Baltimore, St. Louis, Cincinnati, Cleveland, Detroit, Chicago, Buffalo, San Francisco, St. Paul, and one interstate association. These call for $1 to $3 initiation fee: $1 to $5 annual dues. Special assessments of $1 are made in some cases. Benefits in

Digitized by Google

sickness range from 50 cents a day to $10 a week; at death funeral expenses only are paid in some instances, and in others a sum equal to $1 from each member of the association.

Associations for annuity, or retirement fund only, are in New York, Boston, and Baltimore, and there is an annuity guild in Massachusetts. The initiation fees reported are $3 to $5. The annual dues are 1 to 1¼ per cent of salary up to $18 or $20. The annuity is from 60 per cent of salary to $600 a year. Time of service required for retirement is from two to five years with disability, or from thirty-five to forty years without disability.

Associations for both temporary aid and annuity exist in Hamilton County (Cincinnati), Philadelphia, Brooklyn, and District of Columbia. Initiation fees, $1 to $10; annual dues $5 to $40. Annuity, $5 per week to $600 per year, and $100 for funeral expenses in case of death. Temporary aid, during illness, $5 or $6 per week. Time of service required for retirement is two to five years with disability, or thirty-five to forty years without disability.

Pension or retirement funds are authorized by State legislatures for St. Louis, all cities in California, Brooklyn, New York City, Detroit, Chicago, all cities in New Jersey, Cincinnati, and Buffalo. Dues vary little; they are generally 1 per cent of salary. Annuity, $250 to one-half of salary; maximum, $1,200. Minimum length of service with disability, twenty to thirty years; without disability, twenty-five to thirty-five years.

There are no new establishments of annuity funds to be reported for 1898–99, but the existing ones report progress, though some fears are expressed that the annual dues are generally too low, a fact which may lead to financial difficulties in the future unless special efforts are made to increase the funds by holding bazaars and securing donations.

CHAPTER XXXVII.

MISCELLANEOUS EDUCATIONAL TOPICS.

Contents: Athletic gymnastics, by A. Mosso—The artificial production of nitrates for agricultural purposes, from an address by Sir William Crookes—The use of pictures in public libraries, by Samuel Sweet Green.

ATHLETIC GYMNASTICS.

[From "The Physical Education of the Young." By A. Mosso, professor in the University of Turin.]

I.

I asked one of the most celebrated physicians in Italy what he thought of gymnastics. His answer was that many of the best gymnasts whom he had known died of consumption. That is equivalent to saying that vigor and force are two distinct things.

Galen,[1] who was the greatest physiologist of antiquity, treated the subject in his works more than sixteen centuries ago. During the time that he was physician of the gladiatorial school, and at Rome where he was the most illustrious physician at the end of the second century, Galen had occasion to make observations on athletic gymnastics as no one could make them to-day. In one paragraph, speaking of the diseases of athletes and in order to show that vast development of muscle obtained by constant exercise is not an indication of health, Galen said "Gymnastics is dangerous to health."

It seems strange to one who is not a physician that an athlete, with every appearance of extreme robustness which the extraordinary development of his muscular system gives him, should not be for that reason more healthy than others, and that the excess of his force should itself be a cause of weakness. Every physician knows hundreds of persons more agile and of greater force than himself, as acrobats, famous gymnasiarchs, with whom he would not be willing to exchange either lungs or digestive mechanism or any other organism of the body.

"You strangely impose upon our credulity" some readers will say; "this crowns all; after hearing gymnastics preached, to see so much ranting against it." Listen to me. I do not say that gymnastics ought to be suppressed. I am making a criticism of it from a physiological standpoint in the hope of advancing its evolution toward a method more natural and more efficacious in the exercises of the body.

The gymnastics to which the people of Rome devoted themselves was not military, but merely civil and recreative. Of this we have numerous proofs among Roman writers. In a letter to Calvisius, Pliny the younger said that he would take as a model the aged Spirinna, who was admired by everybody for his vigor. He mentioned the endless walks taken by him every day, how he went about entirely naked in the sun before taking his bath, and he spoke of his passion for ball playing.[2]

In Martial's Epigrams there is a ludicrous portrait of a sycophant who, after taking his bath, ran to the thermæ to gather up the balls, and ran with them to

[1] Galeni Ars tuendae sanitatis num ad medicinalem artem spectet an ad exercitatoriam.

[2] Deinde movetur pila vehementer et diu. (Book III, letter 1.)

Digitized by Google

rich and influential players, hoping to get some reward from them. Martial also, in another celebrated verse, tell us that everybody, young and old, played at ball. *Folle decet pueros ludere, folle senes.* "Follis" was a large ball filled with air.

That the Romans did not have fondness for gymnastics, athletic or histrionic, as Mercurial calls it, can be inferred from the fact that athletes in greater part were foreigners. People admired them, they paid them, they applauded them in the thermæ and the circus, but they did not hold them in any honor. We have at Rome monuments in which we see types as though they were alive. The bronze statue in the Museum of the Thermæ which was found in the Via Nazionale represents a characteristic figure of an athlete. Whoever has seen can never forget the stupid, brutal face of the pugilist. The statue is perhaps one of the very best which has been brought to light in our times. It has a natural grandeur, and is executed with such exactitude of detail that one takes it to be an intended portrait of a celebrated pugilist whom the artist represents at the moment when he has come forth victorious from the combat. Thus, as a man in repose, he rests his forearms on his thighs, his body slightly inclined. What gives to him a barbarous aspect is the vast dimension of his jaws. His face on one side is somewhat swollen. His ears are torn, his hair matted with blood, drops of which are seen on different parts of his body.

Yet, among all the monuments of ancient Rome, that which gives in the clearest fashion the history of athletic gymnastics is the mosaic in the upper story of the Lateran Museum. It formed the floor of the east and west expedræ in the baths of Caracalla. The fragments found were readjusted so as to make that grand picture. The anatomical execution, although exaggerating the protuberances of the muscles, is perfect, even in the most minute details. One feels that these figures are portraits of the celebrated gymnasiarchs of the epoch. But it is evident at first view that they are foreigners, for in their physiognomy there is something, I can not say what, of the beastly. The neck is shortened by the vast development of the muscles of the shoulders and the neck, especially the deltoid and the trapezoid. The arms and the legs are in a state of slight flexion. There also the artist represented faithfully the state of partial contraction which we notice in the muscles of those who exercise to excess certain portions of the body, as we see among acrobats performing on the trapeze and among celebrated wrestlers.

The collection of figures represents an athletic school. Some beardless youths are there ready for the course; others hold in hand the discus; others yet, with ferocious eyes and legs firmly planted, await the moment of wrestling. Some have their arms wrapped with the cestus, or the palms of the hands opened in sign of defiance. All around are objects which serve as ornaments in athletic schools—emblems, chaplets, and palms.

II.

By exercise muscular force increases rapidly and steadily continues. Whoever is not a physiologist and a physician studies the effects of gymnastics possibly imbued with the mistake of supposing that extraordinary development of muscles is attended by like effects on the other organs of the body. Touching this error I will mention some experiments made in my laboratory by Dr. Manca.

He, or one of his attendants, took in hand two dumb-bells, each of the weight of 5 kilos. He placed himself before a clock sounding the minute and the second, and by movement of the arms began to raise the dumb-bells upward. At the next second he returned to the point of departure by lowering the arms. At the third the arms were again raised. He repeated these movements of lifting these weights every two seconds until he became fatigued to the point of not being able to continue in the same rhythm.

An assistant standing behind wrote down every day the number of times the

Digitized by Google

dumb-bells were lifted without exhaustion of force. He made the exercise only once a day; but as he continued it for weeks and months, it was observed that his force increased daily with surprising regularity. It was then that by these experiments Dr. Manca gradually pushed the number of times of lifting the dumb-bells from 28, which he made on an average during the first week, to 95, the average in the ninth week of exercises.[1]

Two reasons explain that continued regular progression. First, the muscles gradually accustomed themselves to the more intense exertion. Second, their structure, little by little, was modified and increased in volume. Upon that growth of the muscles I also have made experiments in my laboratory. Professor Aducco, with great precision, photographed the arms and the backs of 5 students; he also made accurate measurements around their chests and arms. These began to exercise every day at the trapeze and parallel bars, and he kept them at it several months, in order to fix the rate of increase which, at the end of four weeks, had already become visible in the muscles of the shoulders, the thorax, and the arms.

The problem is very complex. We become stronger by the practice of gymnastics because, as I have shown in my book on Fatigue, we habituate ourselves to the products of fatigue, and to the poisons which are secreted during the work of the muscles (if I may use that term). But we become stronger also because the muscles, excited by exercise, dilate and increase in volume. The researches made by me tend to divide these two factors. But, in the meantime, it is easy to observe that we become stronger by exercise before enlargement of the muscles becomes apparent. We attain in training a maximum of intensity, and we keep ourselves not for an instant only at the culminant point of physical force, but, even when the muscles have returned to their natural size after long rest, even for months, the beneficial effect of exercise remains.

III.

In the time while I was a surgeon in the Army I became convinced that the most muscular men are not always those who best resist fatigue of military life and infectious diseases.

Prof. Birch Hirschfeld said, in effect, that predominance of the muscular system among athletes leads to a state of tension of all the other organs which, in nourishing the muscles and providing for their motive action, end by exhausting themselves easily and becoming more sensitive to infectious influences.

Let us rapidly examine this problem. From it we shall become convinced that the rapid development of the muscles obtained from athletic gymnastics is not in itself an essential condition of vigor, and that we must distinguish in their operation between their aptitude to produce a maximum effort and that of producing long series of ordinary contractions without fatiguing ourselves too much. * * *

The increase of volume of muscles gained by exercise is so obvious to everybody, that physicians and gymnasts are considered by that fact as having in their hands a means highly efficacious for the reconstruction of the organic system. In order to convince the reader that muscles of moderate volume can do as much work and perform their functions as well as those of greater, I call attention to the leg of Abyssinians.

All officers who have been with companies of native soldiers in the Erythrean country speak in praise of the prodigious rapidity and endurance which Abyssinians exhibit on the march, the facility with which they ascend mountains and hills and reach the top, where our soldiers arrive languid and much worn. Now, Abyssinians and Arabs are well known for the nimbleness of their legs.

Some persons suppose that inferior races endure the fatigue of march better than we because their heel bone is more elongated. It would thus allow the

[1] G. Manca, Italian Biological Archives, Vol. XVII, p. 389.

Digitized by Google

muscles which serve to lift up the body more easily to adapt themselves to it. (These are the ones which form the calf of the leg and which are inserted in the heel by the tendon of Achilles.) Others say that Abyssinians and Arabs have muscles less fleshy but longer than ours. In a series of experiments made by me in concert with Dr. Patrizi at a time when a delegation of Abyssinians and Arabs passed through Turin, I discovered that neither of these suppositions was true. Therefore I still insist that, even while continuing slender, a muscle can acquire aptitude for enduring exertion better than one of greater volume.

Among the Alps I have seen famous guides the muscles of whose legs were less developed than those of some of my companions who were easily fatigued in walking.

Straining the muscles is a thing entirely different from their physiological exertion. Even the work of muscular contractions follows this or that rule according as those contractions are extreme or of moderate intensity. Straining excites the formative function of the muscle more than normal exertion. Straining is a phenomenon ultraphysiological, and almost morbid, which excites the muscle and provokes distension and multiplication of muscular fibers. To make this understood by example, I will call attention to the callosity of the hands and the feet. Pressure continued on one portion of the skin excites in its coatings formative action that makes it thicker and harder. When prsssure ceases callosity disappears. In the same manner the muscles become finer when exercise is discontinued.

Increase in the muscles, however, does not change the general conditions of health. Even the fact of the appearance or absence of muscular development according to existence or default of exercise proves that the matter is a phenomenon entirely local, and not even necessary to life.

We see, by the example of the heart, that physiological contractions of the muscles have no great effect upon the nutrition of the muscles themselves nor upon their development. Of all the muscles of the human body it is the strongest and performs the greatest amount of work. The heart is the first to put itself in motion when we are yet in a state of embryo, and it is the last to rest in death. If the volume of its muscles were to grow continually from exercise, that organ would be distended to the point where it could no longer perform its functions.

The proof that growth of the volume of the muscles is not due to physiological contractions, but rather to straining, is that, when any malady contracts the opening of the valves of the heart, and when, consequently, the blood can no longer course freely into the systole, the volume of the heart constantly increases. Then hypertrophy of the cardiac muscle manifests itself, known under the name of cœur de bœuf (beef's heart) because of the dimensions it acquires.

Contraction of the muscles does not increase their volume so long as it is purely physiological. We observe this by the muscles of respiration, in the diaphragm and intercostal muscles, which are very slender although at continual work throughout life. We may therefore affirm that, in gymnastics, that which augments their volume is not physiological excitation of contraction, but that of straining, which is an irritation ultraphysiological. The dilatation of the muscles effected by athletic gymnastics is a hypertrophy and a phenomenon almost pathological. In thus exaggerating, I wish to give clearer expression to the idea that extreme size of a muscle is a thing entirely distinct from its aptitude to perform, during an extended period, a great amount of mechanical work.

When the section of a muscle becomes larger, it allows lifting of a greater weight, but not the lifting of a moderate weight a greater number of times. Often predominant development of the muscles of the arms is hurtful in the ordinary conditions of life. We shall see further on that masters in gymnastics are those who are least capable of enduring marches and the fatigue of military life.

Digitized by Google

IV.

When we analyze a gymnastic movement we should consider, first, the brain and the spinal marrow where the nervous action which produces contraction begins; second, the muscles which transform chemical energy into mechanical work; third, the waste proceeding from the destruction of one part of the nervous system and of the muscles consequent upon the performance of mechanical work.

Endurance consists in the aptitude we gain in producing from contraction of the muscles a greater effect with the help of exercise, and in the habit which the nervous system slowly acquires of being less sensible of perturbations in the organism caused by waste and blood pollution produced by fatigue. Another important factor is increase of volume in the muscles by exercise which renders them capable of lifting greater weights.

Already knowing that on the cessation of exercise the muscles gradually shrink to their natural volume, and that the effects of training cease also, I asked myself which one of these results continues longest, greater endurance of fatigue or larger volume of muscles.

For an example of those researches on the physiology of gymnastics I will cite one of the experiments made by Professor Aducco. We had arranged in the laboratory some gymnastic equipments, in order to be more easily in reach of the physiological apparatus serving for the study of man when in exercise. Having leaped up to grasp the bar of the trapeze, Professor Aducco made the maneuver of bending his arms and lifting his body so as to put his chin on a level with the bar. Each of these movements lasted about five seconds. Then he let his body down to the full length of his arms and immediately lifted himself again.

When he began, Professor Aducco accomplished eleven or twelve of these feats before fatigue forced him to stop. He progressed day by day to twenty-one and twenty-two. Meanwhile the muscles of the arm gradually grew larger. At the end of a year of rest they had returned to their primitive volume, but when he proceeded to a new series of these exercises he accomplished at the first trial fourteen feats. I hope to find before long others having enough of Professor Aducco's good will to continue these studies. For the present it appears from that first trial that the effect of exercise upon the nervous system—the internal effect, if I may express it—endures longer than the peripheric or muscular effect.

I maintain that gymnastics ought to avoid the efforts which are morbid excitations and apply itself, above all, to act interiorly on the nervous system, in accustoming it to influence the muscles little by little in order to obtain the maximum of beneficial result with the least expense of energy. Scientific gymnastics should not allow itself to be seduced by the development of the muscles produced by means of athletic exercises.

Strainings engender hypertrophy. But this result is fundamentally different from the endurance of work, the most important quality of muscles in common life. In fine, in doing so that the period of inaction may not be too long, we ought by exercise to conserve in the organism that tolerance of the poisons and wastes of fatigue which is one of the essential conditions of being able to perform long-continued work.

V.

The increase of the perimeter of the thoracic frame is one of the most notable effects of gymnastic exercises. Some researches upon that subject have been made by Abel Chassagne and Dally,[1] Marey, Hillairet, Démeny, and others. One may

[1] A. Chassagne et E. Dally, Influence précise de la gymnastique sur le développement de la poitrine, des muscles et de la force de l'homme, Paris, 1881, p. 15.

Digitized by Google

say, in general, that among 100 persons who practice gymnastics for five months, 76 will show increase of thoracic circumference, 16 a bending of the lower chest and the others will be neither better off nor worse. These figures suffice to show that the benefit of gymnastic apparatus, such as parallel bars, fixed bar, trapeze, rings, and dumb-bells, has been much exaggerated when it is maintained that they develop the muscles which take their insertion over the thoracic cavity, and that the result is useful in facilitating ordinary respiration.

Enlargement of the circumference of the thorax of itself alone is not, in fact, capable of ameliorating the conditions of the organism. Except acute and chronic affections of the lungs and serious deformities in the vertebral column, no physician has ever found a malady, a condition of uncomfortableness and debility produced by insufficiency of the air respired. Double organs, as the lungs, kidneys, cerebral hemispheres, etc., can compensate among themselves, and only one-half is sufficient for living. If one can not affirm positively nor say that that is the case with everybody, I have demonstrated, nevertheless, in a work of mine on respiration[1] that all of us inspire a much greater quantity of air than we have need, and I have marked the quantity habitually inspired beyond what is necessary under the name of *respiration de luxe* (superfluous respiration). The researches of Dr. Roblot demonstrated besides that even in the exercises of walking one obtains dilatation of the thoracic cavity and consequent increase of vital faculty. * * *

VI.

I have carefully studied the modifications produced in the heart during muscular efforts while exercising on the trapeze and parallel bars. Irregularities of rhythm in the beatings of the heart are those most apparent. In the course of a prolonged muscular effort the blood does not circulate freely. I have noticed this in an enlargement of the veins of the neck, congestion in the face, and the purple color of the skin. The cause of this is that we can not concentrate nervous action upon only one group of muscles. When the thing is to make an intense effort, almost all of the muscles of the body, especially those of the thorax, contract themselves, they make venous circulation difficult, we feel ourselves weakened, and are obliged to interrupt an effort, more on account of the constraint of circulation and respiration than weakening of muscular force.

Prolonged muscular contractions, such as often occur in exercises on parallel bars, have in physiology a special name. They are called "tetanic." Besides, everybody knows that tetanus is specially characterized by extended violent contractions. The heart does not beat with usual regularity during intense efforts, and irregularity continues several minutes after one has withdrawn from them.

I will cite an example. Professor Aducco in feats on the parallels went through the exercise of passage of position from arms extended to that of arms bent. After a minute or so of this movement small spots appeared on the surface of his arms like extravasations or petechiæ of a bluish color, such as are produced by slightly asphyxiated blood which remains accumulated by the slackening of venous circulation. These spots sometimes continue for five minutes after exercise on parallels, especially during the first days. When Professor Aducco became somewhat fatigued the trouble of surface circulation became less evident and the spots disappeared sooner.

The enormous difference among various individuals as to aptitude in gymnastic exercises is noticed when we observe the exercises practiced on the horizontal bar by young men of the same class entering the gymnasium for the first time. The simple operation of lifting one's self by the arms shows how much we differ one from another from our birth, and it is to such a degree that while some do not

[1] A. Mosso, La respiration périodique et la respiration de luxe. (R. Accademia dei Lincei, 1885.)

Digitized by Google

climb trees except with difficulty, others move among them as easily as cats. In gymnasia they correct somewhat of the inequalities in development of the muscles and make them more fit for work. But when the exercise is left off, the muscles tend to return to their primitive force and proportions. So it is that, after we have been raised by exercise above the original character limits of the race, by inaction we return to the specific type which marks retrogradation resulting from inaction.

The differences in our being at birth do not depend upon the conditions of social life, for they exist equally pronounced among beasts.

Mullendorf has remarked that birds, even those of the same species, show differences in the weight of the pectoral muscles even in the savage state. Domestic birds which do little flying have these muscles less developed than the wild of the same species. Everybody knows that blacksmiths have very large arms. Moreover, some physicians counsel against the practice of fencing as much as gymnastics, because it alters the symmetry of the shoulders; in fact, the right shoulder becomes higher and larger. All physicians are agreed that when a person becomes lame the leg which is alone to support his weight takes on speedy and abnormal development.

In The Banquet, Chapter II, paragraph 17, Xenophon relates what Socrates said about gymnatics:

"Do you laugh because in taking gymnastic exercise I expect to enjoy better health, or to eat and sleep with better relish, or because I seek that sort of exercise to enable me to avoid undue size of the legs and narrowness of the shoulders, as is the case with those who run long distances, or else great breadth of the shoulders and thinness of the legs, which pugilists have; to the end that, rather than fatiguing the whole body, I may keep it in a state of perfect equilibrium?"

THE ARTIFICIAL PRODUCTION OF NITRATES UPON A WORLD SCALE FOR AGRICULTURAL PURPOSES.[1]

The world's demand for wheat—the leading breadstuff—increases in a crescendo ratio year by year. Gradually all the wheat-bearing land on the globe is appropriated to wheat growing, until we are within measurable distance of using the last available acre. We must then rely on nitrogenous manures to increase the fertility of the land under wheat, so as to raise the yield from the world's low average, 12.7 bushels per acre, to a higher average. To do this efficiently and feed the bread eaters for a few years will exhaust all the available store of nitrate of soda. For years past we have been spending fixed nitrogen at a culpably extravagant rate, heedless of the fact that it is fixed with extreme slowness and difficulty, while its liberation in the free state takes place always with rapidity and sometimes with explosive violence.

Some years ago Mr. Stanley Jevons uttered a note of warning as to the near exhaustion of our British coal fields. But the exhaustion of the world's stock of fixed nitrogen is a matter of far greater importance. It means not only a catastrophe little short of starvation for the wheat eaters, but, indirectly, scarcity for those who exist on inferior grains, together with a lower standard of living for meat eaters, scarcity of mutton and beef, and even the extinction of gunpowder. * * *

I have said that starvation may be averted through the laboratory. Before we are in the grip of actual dearth the chemist will step in and postpone the day of famine to so distant a period that we, and our sons and grandsons, may legitimately live without undue solicitude for the future.

---

[1] Extract from the inaugural address of Sir William Crookes, president of the British Association for the Advancement of Science, at its Bristol meeting, 1898.

Digitized by Google

It is now recognized that all crops require what is called a "dominant" manure. Some need nitrogen, some potash, others phosphates. Wheat preeminently demands nitrogen, fixed in the form of ammonia or nitric acid. All other necessary constituents exist in the soil; but nitrogen is mainly of atmospheric origin, and is rendered "fixed" by a slow and precarious process which requires a combination of rare meteorological and geographical conditions to enable it to advance at a sufficiently rapid rate to become of commercial importance.

There are several sources of available nitrogen. The distillation of coal in the process of gas making yields a certain amount of its nitrogen in the form of ammonia, and this product, as sulphate of ammonia, is a substance of considerable commercial value to gas companies. But the quantity produced is comparatively small; all Europe does not yield more than 400,000 annual tons, and, in view of the unlimited nitrogen required to substantially increase the world's wheat crop, this slight amount of coal ammonia is not of much significance. For a long time guano has been one of the most important sources of nitrogenous manures, but guano deposits are so near exhaustion that they may be dismissed from consideration.

Much has been said of late years, and many hopes raised by the discovery of Hellriegel and Wilfarth that leguminous plants bear on their roots nodosities abounding in bacteria endowed with the property of fixing atmospheric nitrogen; and it is proposed that the necessary amount of nitrogen demanded by grain crops should be supplied to the soil by cropping it with clover and plowing in the plant when its nitrogen assimilation is complete. But it is questionable whether such a mode of procedure will lead to the lucrative stimulation of crops. It must be admitted that practice has long been ahead of science, and for ages farmers have valued and cultivated leguminous crops. The four-course rotation is turnips, barley, clover, wheat, a sequence popular more than two thousand years ago. On the continent in certain localities there has been some extension of microbe cultivation; at home we have not reached even the experimental stage. Our present knowledge leads to the conclusion that the much more frequent growth of clover on the same land, even with successful microbe seeding and proper mineral supplies, would be attended with uncertainty and difficulties. The land soon becomes what is called "clover sick" and turns barren.

There is still another and invaluable source of fixed nitrogen. I mean the treasure locked up in the sewage and drainage of our towns. Individually the amount so lost is trifling, but multiply the loss by the number of inhabitants and we have the startling fact that, in the United Kingdom, we are content to hurry down our drains and water courses into the sea fixed nitrogen to the value of no less than £16,000,000 per annum. This unspeakable waste continues, and no effective and universal method is yet contrived of converting sewage into corn. Of this barbaric waste of manurial constituents Liebig, nearly half a century ago, wrote in these prophetic words: "Nothing will more certainly consummate the ruin of England than a scarcity of fertilizers—it means a scarcity of food. It is impossible that such a sinful violation of the divine laws of nature should forever remain unpunished; and the time will probably come for England sooner than for any other country when, with all her wealth in gold, iron, and coal, she will be unable to buy one-thousandth part of the food which she has, during hundreds of years, thrown recklessly away."

The more widely this wasteful system is extended, recklessly returning to the sea what we have taken from the land, the more surely and quickly will the finite stocks of nitrogen locked up in the soils of the world become exhausted. Let us remember that the plant creates nothing; there is nothing in bread which is not absorbed from the soil, and unless the abstracted nitrogen is returned to the soil, its fertility must ultimately be exhausted. When we apply to the land

Digitized by Google

nitrate of soda, sulphate of ammonia, or guano, we are drawing on the earth's capital, and our drafts will not perpetually be honored. Already we see that a virgin soil cropped for several years loses its productive powers, and without artificial aid becomes infertile. Thus the strain to meet demands is increasingly great. Witness the yield of 40 bushels of wheat per acre under favorable conditions dwindling through exhaustion of soil to less than seven bushels of poor grain, and the urgency of husbanding the limited store of fixed nitrogen becomes apparent. The store of nitrogen in the atmosphere is practically unlimited, but it is fixed and rendered assimilable by plants only by cosmic processes of extreme slowness. The nitrogen which with a light heart we liberate in a battleship broadside has taken millions of minute organisms patiently working for centuries to win from the atmosphere.

The only available compound containing sufficient fixed nitrogen to be used on a world-wide scale as a nitrogenous manure is nitrate of soda, or Chile saltpeter. This substance occurs native over a narrow band of the plain of Tamarugal, in the northern provinces of Chile between the Andes and the coast hills. In this rainless district for countless ages the continuous fixation of atmospheric nitrogen by the soil, its conversion into nitrate by the slow transformation of billions of nitrifying organisms, its combination with soda, and the crystallization of the nitrate have been steadily proceeding, until the nitric fields of Chile have become of vast commercial importance, and promise to be of inestimably greater value in the future. The growing exports of nitrate from Chile at present amount to about 1,200,000 tons.

The present acreage devoted to the world's growth of wheat is about 163,000,000 acres. At the average of 12.7 bushels per acre this gives 2,070,000,000 bushels. But thirty years hence the demand will be 3,260,000,000 bushels, and there will be difficulty in finding the necessary acreage on which to grow the additional amount required. By increasing the present yield per acre from 12.7 to 20 bushels we should with our present acreage secure a crop of the requisite amount. Now from 12.7 to 20 bushels per acre is a moderate increase of productiveness, and there is no doubt that a dressing with nitrate of soda will give this increase and more.

The action of nitrate of soda in improving the yield of wheat has been studied practically by Sir John Lawes and Sir Henry Gilbert on their experimental field at Rothamsted. This field was sown with wheat for thirteen consecutive years without manure, and yielding an average of 11.9 bushels to the acre. For the next thirteen years it was sown with wheat, and dressed with five hundredweight of nitrate of soda per acre, other mineral constituents also being present. The average yield for these years was 36.4 bushels per acre—an increase of 24.5 bushels. In other words, 22.86 pounds of nitrate of soda produce an increase of one bushel of wheat.

At this rate, to increase the world's crop of wheat by 7.3 bushels, about 1¼ hundredweight of nitrate of soda must annually be applied to each acre. The amount required to raise the world's crop on 163,000,000 acres from the present supply of 2,070,000,000 bushels to the required 3,260,000,000 bushels will be 12,000,000 tons, distributed in varying amounts over the wheat-growing countries of the world. The countries which produce more than the average of 12.7 bushels will require less, and those below the average will require more; but, broadly speaking, about 12,000,000 tons annually of nitrate of soda will be required, in addition to the 1,250,000 tons already absorbed by the world.

It is difficult to get trustworthy estimates of the amount of nitrate surviving in the niter beds. Common rumor declares the supply to be inexhaustible, but cautious local authorities state that at the present rate of export, of 1,000,000 tons per annum, the raw material "caliche," containing from 25 to 50 per cent nitrate, will be exhausted in from twenty to thirty years.

Digitized by Google

Dr. Newton, who has spent years on the nitrate fields, tells me there is a lower-class material, containing a small proportion of nitrate, which can not at present be used, but which may ultimately be manufactured at a profit. Apart from a few of the more scientific manufacturers, no one is sanguine enough to think this debatable material will ever be worth working. If we assume a liberal estimate for nitrate obtained from the lower-grade deposit, and say that it will equal in quantity that from the richer quality, the supply may last possibly fifty years, at the rate of a million tons a year; but at the rate required to augment the world's supply of wheat to the point demanded thirty years hence, it will not last more than four years. * * *

There is a gleam of light amid this darkness of despondency. In its free state nitrogen is one of the most abundant and pervading bodies on the face of the earth. Every square yard of the earth's surface has nitrogen gas pressing down on it to the extent of about 7 tons—but this is in the free state, and wheat demands it fixed. To convey this idea in an object lesson, I may tell you that, previous to its destruction by fire, Colston Hall, measuring 146 feet by 80 feet by 70 feet, contained 27 tons weight of nitrogen in its atmosphere; it also contained one-third of a ton of argon. In the free gaseous state this nitrogen is worthless; combined in the form of nitrate of soda it would be worth about £2,000.

For years past attempts have been made to effect the fixation of atmospheric nitrogen, and some of the processes have met with sufficient partial success to warrant experimentalists in pushing their trials still further; but I think I am right in saying that no process has yet been brought to the notice of scientific or commercial men which can be considered successful either as regards cost or yield of product. It is possible, by several methods, to fix a certain amount of atmospheric nitrogen; but, to the best of my knowledge, no process has hitherto converted more than a small amount, and this at a cost largely in excess of the present market value of fixed nitrogen.

The fixation of atmospheric nitrogen therefore is one of the great discoveries awaiting the ingenuity of chemists. It is certainly deeply important in its practical bearings on the future welfare and happiness of the civilized races of mankind. This unfulfilled problem, which so far has eluded the strenuous attempts of those who have tried to wrest the secret from nature, differs materially from other chemical discoveries which are in the air, so to speak, but are not yet matured. The fixation of nitrogen is vital to the progress of civilized humanity. Other discoveries minister to our increased intellectual comfort, luxury, or convenience; they serve to make life easier, to hasten the acquisition of wealth, or to save time, health, or worry. The fixation of nitrogen is a question of the not far distant future. Unless we can class it among certainties to come the great Caucasian race will cease to be foremost in the world, and will be squeezed out of existence by races to whom wheaten bread is not the staff of life.

Let me see if it is not possible even now to solve the momentous problem. As far back as 1892 I exhibited, at one of the soirées of the Royal Society, an experiment on "The Flame of Burning Nitrogen." I showed that nitrogen is a combustible gas, and the reason why when once ignited the flame does not spread through the atmosphere and deluge the world in a sea of nitric acid is that its igniting point is higher than the temperature of its flame—not, therefore, hot enough to set fire to the adjacent mixture. But by passing a strong induction current between terminals the air takes fire and continues to burn with a powerful flame, producing nitrous and nitric acids. This inconsiderable experiment may not unlikely lead to the development of a mighty industry destined to solve the great food problem. With the object of burning out nitrogen from air so as to leave argon behind Lord Rayleigh fitted up apparatus for performing the operation on a larger scale, and succeeded in effecting the union of 29.4 grams of mixed nitrogen and oxygen at an expenditure of one horsepower. Following

Digitized by Google

these figures, it would require one board of trade unit to form 74 grams of nitrate of soda, and therefore 14,000 units to form one ton. To generate electricity in the ordinary way with steam engines and dynamos, it is now possible with a steady load night and day, and engines working at maximum efficiency, to produce current at a cost of one-third of a penny per board of trade unit. At this rate one ton of nitrate of soda would cost £26. But electricity from coal and steam engines is too costly for large industrial purposes; at Niagara, where water power is used, electricity can be sold at a profit for one-seventeenth of a penny per board of trade unit. At this rate nitrate of soda would cost not more than £5 per ton. But the limit of cost is not yet reached, and it must be remembered that the initial data are derived from small-scale experiments, in which the object was not economy, but rather to demonstrate the practicability of the combustion method and to utilize it for isolating argon. Even now electric nitrate at £5 a ton compares favorably with Chile nitrate at £7 10s. a ton; and all experience shows that when the road has been pointed out by a small laboratory experiment, the industrial operations that may follow are always conducted at a cost considerably lower than could be anticipated from the laboratory figures.

Before we decide that electric nitrate is a commercial possibility a final question must be mooted. We are dealing with wholesale figures, and must take care that we are not simply shifting difficulties a little farther back without really diminishing them. We start with a shortage of wheat, and the natural remedy is to put more land under cultivation. As the land can not be stretched, and there is so much of it and no more, the object is to render the available area more productive by a dressing with nitrate of soda. But nitrate of soda is limited in quantity, and will soon be exhausted. Human ingenuity can contend even with these apparently hopeless difficulties. Nitrate can be produced artificially by the combustion of the atmosphere. Here we come to finality in one direction; our stores are inexhaustible. But how about electricity? Can we generate enough energy to produce 12,000,000 tons of nitrate of soda annually? A preliminary calculation shows that there need be no fear on that score; Niagara alone is capable of supplying the required electric energy without much lessening its mighty flow.

The future can take care of itself. The artificial production of nitrate is clearly within view, and by its aid the land devoted to wheat can be brought up to the 30 bushels per acre standard. In days to come, when the demand may again overtake supply, we may safely leave our successors to grapple with the stupendous food problem.

THE USE OF PICTURES IN PUBLIC LIBRARIES.[1]

By Samuel Swett Green.

In Great Britain, in 1845, was enacted a law entitled "An act for encouraging the establishment of museums in large towns."

The well-known law of 1850 is entitled "An act to enable town councils to establish libraries and museums." These museums are defined in a section of the law to be "museums of art and science." Towns in Great Britain may use public money to establish and maintain museums of art and science as well as libraries. These are not provided for in Massachusetts by existing library laws. Arrangements are made in some towns, however, by which art galleries may be housed in the same building as a public library and be under the control of the library board.

[1] The Report of the Commissioner of Education for 1895-96 contains a chapter on Art Decoration in Schoolrooms. In this article, taken from the Eighth Report of the Massachusetts Free Public Library Commission, Mr. Samuel Swett Green, librarian of the free public library of Worcester, Mass., shows the possibilities open to libraries along that line.

Digitized by Google

In Fitchburg, for example, the Hon. Rodney Wallace, in 1885, gave to the city a building to be used for "a free public library, reading rooms, and art gallery, and for no other purposes," on condition that the city government accept it and agree to bear the current expenses. There is a collection of oil paintings in the upper story of that building.

Many public libraries are owners of works of art which have been given to them.

As early as 1869 the Boston Public Library acquired, by gift, the Tosti collection of engravings.

The City Library Association of Springfield has a museum of natural history connected with it, as well as an extensive art collection. This is not a public library, however, controlled and supported by the city, but a private institution, to which the city gives liberal assistance annually, in consideration of the fact that its privileges are extended to the general public without cost.

While it would be out of place to spend money appropriated by a town for a library for buying oil paintings and statuary to form an art museum, it is considered proper to buy photographs and plates, not only bound in volumes, but detached, for the purpose of illustrating subjects treated of in books in the library.

In so far as the writer knows, the Free Public Library in Worcester was the first public library in the country to make a deliberate and large expenditure for photographs, engravings, and other kinds of plates, to use for the purpose of popular education in connection with the daily work of the library. The present librarian became connected with it as a director January 1, 1867, and as librarian January 15, 1871. Soon after his connection with the institution he introduced the plan of buying freely pictures separate from books. These have been bought mainly from the income of a fund established by the will of Dr. John Green, the founder of the reference department, but to a considerable extent also from the city appropriation.

Since 1870 interest in art instruction has grown apace. Instruction in drawing has been given in the public schools. In July, 1871, Mr. Walter Smith, who had been brought here from abroad, was made art director in this Commonwealth. A growing and large interest in making all objects beautiful and in having everywhere tasteful surroundings showed itself in the community generally.

It became very evident to the librarian in Worcester that pictures must be provided if the library was to do the work which might properly be expected of it in fostering the art spirit and in giving it material by means of which it might get exercise. A sufficiently large number of copies of Jones's Grammar of Ornament in its larger form, a copy of L'Ornement Polychrome, and other similar works, were bought, and collections of plates, mainly large photographs representing the work of masters in art, were bought from time to time. This library also became a pioneer in the work of bringing about a close connection between libraries and schools. When these relations were established, it soon became obvious that not only in providing for the newly awakening interest in art, but also affording necessary aid in geography, history, and other studies, large collections of pictures must be acquired. The value of the illustrations in books was recognized, as well as their rapid increase in number and excellence. But here, as well as in instruction in art, more, larger, and better pictures were needed, and these had to be bought as separate plates, and kept in portfolios so that they could be hung on walls.

Not only was the pictorial matter acquired by the library placed at the disposal of teachers, scholars, and the general public in meeting their daily needs, but not infrequently exhibitions were given. Thus early a large collection of good-sized photographs, illustrating the work of Raphael and the development of his genius, was shown. Then followed other exhibitions of photographs of pictures of artists of different Italian and German schools of painting. The experiment was successfully tried of having members of the Worcester Art Society make themselves

Digitized by Google

acquainted with groups of pictures which they undertook to explain to visitors. A lady well acquainted with pictures was hired to come from Boston to be present at one of the exhibitions and enter into conversation with persons interested about the pictures and artists. This plan gave much satisfaction.

When the new library building was added to the older one, in 1890, new facilities were provided for exhibitions. The interior of the new building was planned by the librarian, and arrangements for a hall and art galleries were made. Many exhibitions have been given for the benefit of pupils in the schools. For example, when scholars in the high schools have been studying essays from the Spectator, classes are brought to the library, and photographs of old buildings in London, colored pictures of the exteriors of buildings and of scenes within buildings in the times represented in the writings and other illustrations of London in the time of Addison and of the manners and occupations of its inhabitants are shown to them. If they have been engaged in studying plays of Shakespeare, the plates of the work known as the Homes and Haunts of Shakespeare, in colors and in black and white, are hung on the walls of a hall, together with the illustrations of scenes in the plays of Shakespeare by Darley; and facsimiles of the quartos and folios and works giving representations of the exterior and interior architecture and of the costumes of the time of the dramatist are brought together, and classes, with their teachers, invited to examine and study them.

For pupils in the grammar schools exhibitions have been provided. Thus, when in the school course the civil war of 1861–1865 has been studied, one hundred photographs of bridges, houses, roads, and battlefields (with the dead lying unburied) are placed on the walls of a hall, with Forbes's etchings descriptive of life in the camp during the war, battle pictures in color, and a set of Confederate etchings. All are carefully inscribed with names of places, scenes, etc. (with which the memories of the children are at that time filled); and the principals of the grammar schools are notified that the exhibition is open, and that such boys and girls as desire may come to it between the hours of 4 and 6 o'clock in the afternoon.

Last winter a more elaborate exhibition was held. The colored plates of Catlin, illustrating life among the North American Indians during his residence among them; Thomas Moran's beautiful and striking representations of the scenery in the Yellowstone Park; a set of chromolithographs, such as are used in German schools in teaching physical geography; and Trouvelot's plates, showing how the heavenly bodies look through a telescope, were hung on the walls of a hall. By arrangement with the superintendent of schools, teachers registered their names at his office, and placed after them the dates when they would like to bring scholars to the library. It was announced to the librarian every day, by telephone, what school was coming. Such pupils in a school as desired came to the library, accompanied by teachers, after school in the afternoon, and spent an hour in examining the pictures and in listening to a lecture about them. This exhibition was peculiarly successful, and was very entertaining and instructive to the children.

Another exhibition of a similar character has been planned for the present winter. A course of lectures was given by Dr. G. Stanley Hall to the teachers of Worcester last winter. Some of these were illustrated at the library by bringing together into a room pictorial and literary matter likely to prove useful in teaching the subjects which he was showing them how to teach.

Classes go to the library from the high schools and from grammar schools to look over, in a room by themselves, photographs of classical remains, illustrations of armor, or pictures interesting in connection with other subjects.

Twenty years or so ago geography was taught in the Worcester Normal School by means of lantern slides. The principal of one of the grammar schools in Worcester has 1,500 slides which he uses in giving instruction in his school. For example, he has a series of pictures which he has taken, showing the various points of interest in Concord, Mass. These pictures are shown and the connection of the

Digitized by Google

place with the Revolution and the town's distinguished residents are mentioned and talked about. Interest is thus excited that may lead to extended studies in history and literature. The teacher spoken of has been doing work of this kind for ten years. The superintendent of schools in Worcester has become much interested in the matter, and is endeavoring to have instruction given by slides in other, if not in all, the public schools. Many of the slides are prepared from material in the public library. That institution has skylights and a dark closet for the use of photographers, and large numbers of pictures which teachers desire to copy.

Prof. William M. Davis, of Harvard University, has of late years been very much interested in having instruction given by means of lantern slides; and in No. II of Papers from the Physical Geography Laboratory of Harvard University may be found a list of geographical lantern slides, of great interest, prepared for use in Cambridge public schools by Professor Davis (Cambridge, Mass., Harvard Printing Company).

The first of next month (February, 1898) an exhibition is to be given at the library in Worcester, of especial interest to schools. The Public School Art League, having raised $300 or $400 in small subscriptions by residents of Worcester, has lately been buying objects to be used in decoration of schoolrooms in different portions of the city. Before they are put in the places they are to occupy, they are all of them to be brought to the library for a public exhibition. The library will add a collection of photographs, selected from its stores with particular reference to their desirability for purposes of school decoration; and it is expected that a new interest will be awakened in the community by the display, in providing additional means to be used in furtherance of the good plans of the School Art League.

There has just been hung in a room in the Worcester Library a collection of photographs illustrative of Greek sculpture. There is a large class of ladies studying this subject. It began the study last winter, and is continuing it the present season. The members of the class call at such hours as they please to examine the photographs, and once a week several ladies come and study them for two or three hours. Societies connected with churches that are making fireside travels, Chautauqua circles, clubs for the suburbs of the city, teachers with classes to which instruction is being given in the history of painting, come to the library; they have rooms assigned them and are provided with illustrative matter on such subjects as they have an interest in at the time.

A large number of exhibitions is provided for the general public. Such as have been given in the last few years are described in the annual reports of the library. Examples are: The antiquities of Russia; the remains of Pompeii; Moorish art in Cairo; English, French, and Spanish painting; classical antiquities. Occasionally a deserving local artist is discovered, and is allowed, in connection with an exhibition, to fill a room with his pictures. Several exhibitions have been given in the Worcester Library in conjunction with the Worcester Art Society. Thus, when the new library building was opened, the art society filled the galleries with portraits gathered mainly from homes in the city. As the earlier artists of the country and later painters, as well as the most distinguished living portrait painters, were represented in the exhibition, it gave, to some extent, a history of American portraiture. At another time the art society gave an exhibition of china, and winter before last kept up a continuous exhibition of oil paintings and bric-a-brac for four months. The library assisted by filling a room with photographs of English and Continental cathedrals of large size, and afterwards with representations of the frescoes of Michael Angelo in the Sistine Chapel. The art society spent from $300 to $700 on each of these exhibitions. In connection with the exhibition of china, prizes were given by the art society for ceramic decorations by local amateurs.

A very large use of pictures is being made in the new Forbes Library at Northampton. That institution was opened to the public July 1, 1895, under the care of an experienced librarian, Mr. Charles A. Cutter, who was for twenty-four years librarian of the Boston Atheneum. The Forbes Library had accumulated a considerable sum which could be spent at the start in buying books, photographs, and objects of art, and is provided with an income which will enable it to make valuable additions from year to year. From the second annual report of the library, for the year ending November 30, 1896, it appears that several successful exhibitions were given in that year. One of great interest consisted of mountain photographs owned by the Appalachian Club, giving views of the Alps, the Tyrol, Ætna, and the Caucasus. This was followed by a loan exhibition of photographs taken in India, Japan, and Siam. These belonged to a resident of Northampton, who made the display more attractive by lending to the library a "case full of oriental curiosities—idols, swords and daggers, palm-leaf books, pipes, and the betel-nut apparatus." Besides other exhibitions of material owned by the library and borrowed, it had two furnished by a representative of a large dealer in photographs.

Recently an interesting exhibition has been given in the Forbes Library building of the work of amateur photographers.

"These exhibitions," the librarian states, "have not only given pleasure, which in itself would be sufficient justification, but have broadened their visitors' minds, have supplied some of the advantages of travel to those who could not leave home, have renewed the impressions of those who had been abroad, have increased the knowledge of art, and educated the taste of all who saw them." The library has been invited to join a league of 20 Massachusetts libraries, who will prepare a traveling exhibition, stopping two weeks at each library.

The Boston Public Library, under its present management, is showing a very marked interest in the cause of popular entertainment and education, and is using its great resources and wide and powerful influence efficiently to these ends. In trying to show what use this library is making of pictures, I can not do better than to incorporate here the following letter, just received from Mr. Otto Fleischner, the head of the art department:

THE PUBLIC LIBRARY OF THE CITY OF BOSTON, *January 1, 1898.*

SAMUEL S. GREEN, Esq.,
Librarian, Worcester Public Library, Worcester, Mass.

DEAR MR. GREEN: In answer to your letter of December 19, I give below a partial list of exhibitions of pictures in this library, which I hope will serve your purpose.

We now keep a regular record of all the exhibitions, but have no lists of the first year after the opening of this department.

Our aim is to have it known that students and casual visitors will find something new and interesting, and at the same time instructive, to see on every successive visit to the library. When the walls of the Barton Library, which is mainly used for this purpose, are not occupied by special exhibits, a selection of photographs is put up without a set programme, although a certain order is followed. For instance, the artists of a certain school are shown in sequence, or a collection of landscapes or genre pictures or portraits, interior decoration, etc.

The special exhibitions are arranged with a view to illustrate special events, lectures, courses in the public schools or the Institute of Technology, anniversaries, national and other holidays. For Christmas just past a collection of Nativities of different schools was exhibited, while Easter will be a good season for a collection of Madonnas. For Washington's birthday last year a very interesting loan collection of Washington portraits was put up, and will be repeated this year. Decoration Day is celebrated by a display of a large collection of Brady's war photographs. Patriot's Day, Bunker Hill Day, Fourth of July, are illustrated by maps, views of battles, portraits of generals, etc.

Among the special exhibitions may also be mentioned those in connection with—

Professor Weir's Lowell Institute lectures on Italian art.

Professor Homer's Lowell lectures on Romanesque architecture.

Hopkins's lectures on the history of art to the teachers of the Boston schools, which will be continued this winter.

Industrial arts in connection with the Arts and Crafts Exhibition.

Digitized by Google

Collection (loan) of book plates by Boston artists.
Collection (loan) of historical and rich modern bindings.
Loan collection of original drawings, engravings, and reproductions, showing the methods of book illustration, in connection with the Library Club meeting.
Holbein portraits and other pictures, on the four hundredth anniversary of the artist's birth.
Cabot Centennial; portraits, maps, views, portraits, etc.
Bradford Manuscript; autographs, views, portrait's, etc.
The Constitution, Cuba, Alaska, etc.
Loan collection of original drawings and paintings for book illustrations, etc.

Of course all special exhibitions are announced in the newspapers.

To these exhibitions must be added the permanent display of the Arundel prints in the fine arts room, the collection of solar prints suitable for school decoration, and the Howard Pyle paintings illustrating American historical subjects, both in the juvenile room.

Since last fall these exhibitions have been extended, with gratifying results, to the 10 branches, and several special collections are sent in rotation to the various branches and exhibited for two weeks. The schools in the respective districts are notified, and visit the branch in classes, under the supervision of teachers.

The regular collections of photographs are not used for this purpose, but the library purchased within the last six months a collection of about 2,500 half-tone reproductions from paintings and sculpture (classical picture and sculpture galleries) and about 1,000 gelatine prints (European architecture), which are exclusively used for branches and schools.

The "Classical Picture Gallery" and "Classical Sculpture Gallery," published by H. Grevell & Co., of London, and "European Architecture," published in Chicago, are monthly serials, and are still continued.

A portfolio of a selection of these pictures is sent regularly on the first Tuesday of every month to each branch, where they are either displayed on the walls or used on the tables. These portfolios are also issued to teachers for use in the schoolroom, the portfolios being so arranged that they may serve as easels to show the pictures from the teacher's desk.

An experiment will be made during January to hold a lecture in connection with the exhibitions. This will be done under the auspices of one of the art clubs, who will supply a competent lecturer.

In case the experiment proves feasible, a regular course of lectures will be arranged for the winter.

Very truly, yours, OTTO FLEISCHNER.

Can libraries in small towns avail themselves of advantages which come from ready access to generous collections of pictures?

It will be noticed that the Forbes Library borrowed the pictures for the exhibition of mountain views from the Appalachian Club. Now, this club, it is announced, is ready to lend its photographs to any library that will pay freight and attend to the cost of hanging the pictures. There are persons interested in small towns who have collections of plates and objects of art and other interesting material which they would be willing to lend to libraries. Among others, there are persons born and perhaps brought up in little towns who would be glad to lend collections which they own, or to influence others to lend collections, for the instruction and entertainment of the present residents in the places of their birth. It is understood that the Century Company has sometimes lent the drawings and paintings from which the illustrations in its magazines have been prepared. Other publishers have similar collections which they could perhaps be induced to lend. Arrangements could undoubtedly sometimes be made with dealers to send small lots of pictures to little towns.

Mr. John Cotton Dana, now the librarian of the City Library Association of Springfield, in this State, but until recently the librarian of the Public Library of Denver, Colo., did some inexpensive work while living in the latter city in bringing together and distributing collections of pictures. He had illustrations cut out from illustrated papers and magazines and mounted on stiff paper, distributed them under heads, and arranged them in catalogue drawers. Teachers and others could go to these drawers and select such pictures as they wanted to take to schools or homes. This work of Mr. Dana is described in a recent volume of the "Library Journal."

It is often said that any town, no matter how small it is, may have a unique library. All that is necessary is to start and maintain a movement to bring together every book, pamphlet, broadside, or newspaper that will in any way throw light on the history of the town or the lives of its residents or past inhabitants. It may not only have a mass of local literature, but may add to this a museum of antiquities and other objects which illustrate the history or show the present products and interests of the town. Both of these things have been done in a most admirable manner in the public library of the beautiful little town of Lancaster, in Worcester County. But every town library may have a unique art collection. Poor indeed is a town without amateur photographers among its permanent or summer residents. With little trouble and at no great expense any town library may secure a valuable collection of local photographs. Preserve the remembrance of beautiful trees or groups of trees. The landscape changes from time to time as wood is cut or as alterations are made for utilitarian purposes. Have pictures taken to show how the town looks to-day. Get photographs of all prominent residents and, so far as possible, likenesses of former residents and of persons born in the town who have been important factors in adding to the prosperity of larger places. Take pictures of old houses. If a library, even in a very small town, should do this kind of work systematically and do a good deal of it every year, it would not be long before it would have a valuable and, as stated before, unique collection.

A town library may join a league like the one which the Forbes Library was asked to attach itself to.

Finally, traveling libraries of pictures are available. The Woman's Education Association of Boston has done excellent work in sending to small towns traveling libraries of books. It is now entering on the work of sending boxes of pictures to places where they are desired. It has already done work of this kind.

I will only add that considerable work of this kind is being done in the State of Wisconsin. Attention has for some time been attracted to that State by the excellence of the work which it has been doing by sending boxes of books to sparsely settled portions of the State. In a report recently issued by the Wisconsin Free Library Commission on "Free Traveling Libraries in Wisconsin" there is a very interesting account of good work that is being done by traveling boxes of pictures in Portage County.

CHAPTER XXXVIII.

THE TRANS-MISSISSIPPI AND INTERNATIONAL EXPOSITION, HELD IN OMAHA, NEBR., JUNE 1 TO OCTOBER 31, 1898.

Report of J. C. Boykin, Agent of the Bureau of Education, and Chief Special Agent of the Interior Department.

WASHINGTON, D. C., *February 1, 1899.*

SIR: In making a report of the participation of this Bureau in the Trans-Mississippi and International Exposition, it may be well to give a brief history of the enterprise and a statement of its general features. Without this the bearings and surroundings of our own exhibit can not be well appreciated.

The credit of first effectively proposing an exposition to be held in Omaha is said to belong to Mr. Edward Rosewater, the editor of the Omaha Bee. He had been impressed by the success of the World's Fair at Chicago and by its advantages to that city, and his belief that a similar exposition would have a like effect upon Omaha had been strengthened by the experience of Atlanta, Ga., with its exposition of 1895. A convention had been called in 1895 to consider the commercial condition of the Trans-Mississippi States, and it was expected that steps would then be taken to extend the commercial importance of that section. The time seemed ripe to Mr. Rosewater for advancing his ideas as to an exposition, and he accordingly broached the subject to a number of influential men of the city, and published (November 25, 1895) an editorial in his paper earnestly advocating the idea. The proposition was taken up by the Trans-Mississippi Commercial Congress almost immediately afterwards, and the actual initiation of the exposition was the most important work accomplished by that gathering, its president, Hon. W. J. Bryan, introducing the following resolution:

Whereas we believe that an exposition of all the products, industries, and civilization of the States west of the Mississippi River, made at some central gateway where the world can behold the wonderful capabilities of these great wealth-producing States, would be of great value not only to the Trans-Mississippi States, but to all the home seekers in the world: Therefore,

Resolved, That the United States Congress be requested to take such steps as may be necessary to hold a Trans-Mississippi Exposition at Omaha in the year 1898, and that the Representatives of such States and Territories in Congress be requested to favor such an appropriation as is usual in such cases to assist in carrying out this enterprise.

After the adjournment of the congress, active steps were taken to make the suggestion an accomplished fact. In January, 1896, the Trans-Mississippi Exposition Association was formally organized and incorporated. Its capital stock was fixed at $1,000,000, issued in shares of $10 each. Efforts were begun for securing Congressional and State recognition and, incidentally, appropriations. The sundry civil bill passed by Congress and approved June 10, 1896, carried an appropriation of $200,000 for a Government exhibit, and contained the usual provisions as to notification and invitation to foreign governments to participate and as to the admission of exhibits free of duty. Of the appropriation as it finally stood, $62,500

Digitized by Google

were to be used for the erection of a building and the remainder was to be for the preparation and care of exhibits. The Government exhibit was to be controlled by a board of management consisting of one representative of each of the Executive Departments and one each from the Smithsonian Institution and the Fish Commission.

The passage of this bill made the exposition a certainty. In a few months stock subscriptions were secured in sufficient amount to meet the provisos in the appropriation bill and in the articles of incorporation, and December 1, 1896, a meeting of the stockholders was held and a board of fifty directors was elected. These, in turn, formulated the permanent organization of the association and elected the following officers: Gurdon W. Wattles, president; Alvin Saunders, resident vice-president; Herman Kountze, treasurer; John A. Wakefield, secretary; Z. T. Lindsey, manager department of ways and means; Edward Rosewater, manager department of publicity and promotion; F. P. Kirkendall, manager department of buildings and grounds; E. E. Bruce, manager department of exhibits; A. L. Reed, manager department of concessions and privileges; W. N. Babcock, manager department of transportation.

The final decision as to the location of the exposition was reached March 17, 1897, and the corner stone was laid with elaborate ceremony April 22.

THE GROUNDS AND BUILDINGS.

The site was an eligible one, about 2 miles from the center of the city. It was composed of three distinct "tracts," but these were so situated, and the arrangement was such, that each had its individuality. All were connected by streets and viaducts, and what might have been the cause of inconvenience and lack of harmony under less skillful management, was turned into a positive advantage.

What was known as the Kountze tract was a rectangular piece of ground 670 feet wide and about a half mile long, extending from Sherman avenue (Sixteenth street extended) to Twenty-fourth street. Here was situated the "grand court." A long, narrow lagoon, spread out at one end in the form of a trefoil, was surrounded by the principal exhibit buildings, recalling the court of honor at the World's Fair, the likeness being increased by the extensive use of white staff in construction and decoration. At the head of the lagoon stood the Government building with its gilded dome and impressive columns and sculptured groups. On the south were the buildings devoted to fine arts, liberal arts, and mines and mining, and on the north were those of agriculture, manufactures, and machinery and electricity. All these were connected by colonnades, which added much to the completeness of the plan and proved a positive boon in inclement weather.

THE EXHIBITS.

The exhibits in the Government building were materially different in most respects from those at previous expositions, the plan of the officials being to present fresh collections as far as possible at each succeeding exposition. Where it was necessary to use the same articles the difference in arrangement and decoration was such as to give them an entirely different aspect. If this were not kept constantly in mind the Government exhibits, after a few expositions, might become monotonous. But since the same departments, the same bureaus, and the same functions are to be exhibited every time, the task is not an easy one.

A partial enumeration of the articles shown filled 45 closely printed octavo pages in the official catalogue. From this the scope of the exhibits may be judged.

The Fine Arts Building, or more properly buildings, for it was a double structure, contained a creditable collection of pictures. A feature which added greatly to its usefulness was a series of lectures by the director, Mr. A. H. Griffith, of Detroit, Mich., who in his talks passed from picture to picture and explained their

Digitized by Google

characteristics and those of the schools of art which they respectively represented. In lieu of the usual medals and diplomas, a fund of $5,000 was expended in the purchase of meritorious pictures, the idea being that artists would prefer a sale to any other form of award.

The Liberal Arts Building and the Manufactures Building faced each other from opposite sides of the lagoon. In the former among the most conspicuous exhibits were typewriters, pianos, billiard tables, artificial limbs, gramophones, writing papers, photographs, furs, and jewelry. Prominent exhibits in the manufactures building were of meats, pork and beef products, salt, shoes, whiskies and beer, oils, hats, clothing, watches, stoves, sewing machines, house furnishings, chocolate, etc.

The Mines and Mining Building was filled almost entirely with collective State exhibits of minerals. South Dakota, Missouri, Colorado, Montana, Minnesota, Utah, New Mexico, Wyoming, Oregon, and Nevada made extensive exhibits in this department.

The building devoted to Machinery and Electricity occupied the position on the lagoon opposite to that of the Mines and Mining Building. The display of electrical machines and devices was excellent, but not extensive, and the exhibits of historical telephone and telegraph apparatus were noteworthy. In machinery other than electric the display was meager.

The Agriculture Building presented the appearance that has come to be considered inseparable from a building so named. With the exception of three or four excellent exhibits made by railroads, all the extensive displays were collective State exhibits. Naturally Nebraska and the neighboring States of Iowa, Kansas, and Missouri made the largest exhibits here, but New Mexico, Utah, Texas, Minnesota, Oregon, Oklahoma, North Dakota, Montana, and even Hawaii, were well represented. There was a good deal of sameness in these exhibits, since the States in that section all boast of similar products; but the lumber of Oregon, the flour of Nebraska, the forestry of Montana, the photographs of Hawaii, the wools of Minnesota, and the ingenious pictures and lay figures of the Burlington Railway served to give variety to the building and relief from the profusion of corn and grain.

The Horticulture Building and the Transportation and Agricultural Implement Building were very inconveniently placed, the former beyond the State buildings on the Bluff tract, and the latter almost at the extreme northern limits of the grounds. Neither building, therefore, received its just proportion of visitors on ordinary occasions. As in the Mining and the Agriculture Building, the exhibits of horticulture were largely those of the State commissions. In the department of transportation the railroads naturally occupied the chief space. Powerful engines of the latest type, an elegant Pullman passenger train, refrigerator cars, and a historical engine and passenger car attracted probably the most attention in this section.

The most striking feature of western farming to an eastern man is the extensive use of machinery. So far as the work of the field goes, hand work is practically eliminated in western farming, and it is a fact that the old familiar hand tools are rarely seen. Naturally the display of agricultural machinery at this exposition was, as compared with either Atlanta or Nashville, very extensive, and many articles were exhibited with prospects of profitable sale which would be merely objects of curiosity in most parts of the East and South.

THE INDIAN CONGRESS.

The Indian act of July 1, 1898, carried an appropriation of $40,000 to enable the Secretary of the Interior to assemble representatives of different Indian tribes as a part of the Trans-Mississippi and International Exposition. The purpose of this

Digitized by Google

assembly was declared to be "to illustrate the past and present conditions of the various Indian tribes and the progress made by education, and such other matters as will fully illustrate Indian advancement in civilization."

In pursuance of this provision, an army officer who had been acting as Indian agent at one of the near-by reservations was designated to take charge of the "congress." About 700 Indians, representing 41 tribes, were gathered, and were located on the north tract. They were lodged in "tepees" and "wickiups" of their own construction, and until the close of the exposition were maintained there from the fund named in the appropriation. It was widely advertised that this assemblage would present an opportunity to see the American Indian as a savage, and, as far as possible, primitive conditions were imitated in the encampment, both in dress and in mode of living, though it was apparent that camp life was a novelty to many of the Indians participating. One young Indian came one day to my space in the Government Building and asked to see a certain book of photographs in the Indian Office exhibit. He looked through the book with interest, and finally showed me a photograph of himself. It represented him as standing in front of a neat frame cottage, by the side of a two-horse plow, all his own. In the picture he was clothed in the orthodox civilized garb, but as he stood before me he wore a suit of fringed and beaded buckskin and an elaborate feather bonnet. I asked which of the two was his usual costume, and he replied that he had never worn paint and feathers before, and he only did it then "to show people what it was like." This man had been a Carlisle student, and in the encampment were a number of other pupils and former pupils of the various Government schools. For this occasion, however, they were all "blanket Indians."

From time to time exhibitions were given of primitive dancing, but the sham battles were the great feature of the "congress." As spectacles these were very striking. The performance always began by marching the bands from the different tribes up to the grand stand, where they were introduced to the spectators by an announcer. Then all were massed at the rear of the exhibition space and marched in a solid body over the hundred yards intervening to the grand stand. That march was one of the most impressive scenes of the exposition. The highly colored blankets, the gaudy trappings of the horses, the hideously painted faces and bodies of the men, and the fanciful dress of the women combined to make the sight a memorable one. Such a large number of Indians will probably never be collected in one body again.

At the end of their march across the grounds they dispersed with a volley of musketry and a wild yell, and prepared for the sham battle that was the climax of each entertainment. The "braves" were divided into two parties, and a plan of battle of the familiar dime-novel variety was carried out. The befeathered Indians dashed about the field on their painted ponies, yelling and shouting, now and then ambushing an enemy and depriving him of an artificial scalp lock provided for the occasion, and then, by way of diversion, they would catch a prisoner and burn him at the stake—or, to be more exact, at the electric-light post. The show was very exciting, and the Indians entered into it with the greatest gusto; their own enjoyment was the most entertaining feature.

THE GENERAL EDUCATIONAL DISPLAY.

There was no distinct woman's department at this exposition, as at many of its predecessors, but instead the department of education was confined to a "board of education" composed wholly of women. It was expected that they would have charge of all congresses of philosophic and scientific societies as well as of educational exhibits. The officers of the board were: President, Mrs. Winona Sawyer, Lincoln, Nebr.; vice-presidents. Mrs. Thomas L. Kimball, Omaha; Mrs. Kittie L. Dutton, Hastings, and Mrs. Frank Johnson, Crete; secretary, Mrs. Frances M. Ford, Omaha.

Digitized by Google

The Boys and Girls' Building was erected by the board of education from funds contributed by school children. This was a small structure, with an audience room as its main feature. A series of lectures on cooking was given here, and was the principal use to which the room was put. On one side of this chamber was a room in which needlework and similar articles were sold, and on the other side was a "model schoolroom," which was not a schoolroom at all, but a room containing the exhibits of several schoolbook and supply concerns. In this building, too, was a crêche for the accommodation of young children whose mothers were seeing the exposition.

The educational exhibits proper were scattered. The Nebraska schools and institutions occupied the gallery of the Manufactures Building; the schools of other States were in the gallery of the Liberal Arts Building, while a few technical schools had their material in the gallery of the Mines and Mining Building. It will be seen that no favoritism was shown. All of these exhibits were put upstairs. The galleries were wide and commodious, and save for their inaccessibility were well suited for the purpose. But that inaccessibility was a serious matter, and the same old story of a paucity of visitors must be repeated, though the gallery exhibits in Omaha did fare somewhat better than those in Atlanta or Nashville.

The most attractive of the educational displays was that of manual training from the Omaha High School. Every afternoon during the latter part of the season the manual training teacher, Mr. J. E. Wigman, was there with a class of boys and carried on the regular work of the school for the benefit of visitors. He had a good equipment of lathes and tools necessary for the simpler kinds of woodwork and parquetry, and the work was confined to that. Mr. Wigman is a practical mechanic and insists upon careful and accurate work from his pupils. Many of the "projects" exhibited, particularly the zithers, checkerboards, and Indian clubs, would have been considered excellent work even as coming from journeymen workmen. In fact, the noticeable accuracy of some of the pieces might have been criticised by those manual-training people who hold that such attention to the finished product is out of place in a school of this kind. But the models used and the different principles taught were those usually found, and it did not appear that anything was lost on the educational side because of the constant thought of good workmanship.

The greater popularity of this exhibit than of those around it was due to its recognition of the facts that all experienced exposition men have observed, namely, that visitors demand exhibits in motion, and that persons as well as things are necessary to a successful exhibit.

The Nebraska school exhibit was installed in a series of alcoves and was almost wholly a wall exhibit of class-room work. The general impression conveyed was that the schools of the State are well taught and by approved methods. It is certain that those who selected the material were well acquainted with modern ideas, and that there is enough work done in the State in accordance with such ideas to make a rather extensive and very satisfactory exhibit. The plan of installation was good without being expensive. The monotonous succession of alcoves containing similar work and presenting the same general appearance, and the undue height at which much of the work was placed, probably came from the necessities of the case. The University of Nebraska occupied the greater part of the west end of the gallery with a well-selected and well-arranged exhibit. Schools for the defective classes and private institutions were allotted space in the south gallery.

The collective exhibits of the schools of Missouri, Montana, Oregon, Kansas, and Colorado, and of Los Angeles County, California, were in the gallery of the Liberal Arts Building. None of these exhibits was as extensive as that of Nebraska, and none showed evidence of the expenditure of as much money. The Art Institute of Chicago occupied a small section of this gallery with an exhibit which in

Digitized by Google

arrangement and material was worthy of the institution. The Massachusetts Institute of Technology was represented by a collection of photographs, designs, etc., in the gallery of the Mines and Mining Building.

One of the features of the educational exhibit was the attention given to exhibits of individual pupils. Gold, silver, and bronze medals were offered for individual work in composition, history, penmanship, drawing, industrial training, and nature study. Exhibitors were divided into six classes, according to age, and prizes were given in each class for all the subjects named.

THE TRANS-MISSISSIPPI EDUCATIONAL CONVENTION.

Teachers' conventions in connection with expositions have not often been successful. A crowded city with a single thought—the exposition—is not the place which one would select for the reposeful thought necessary to consideration of weighty questions.

Teachers who come are not in the frame of mind to calmly sit for hours and listen to the reading of solid papers on professional topics. The distractions are too many, and the trend of the surroundings prompt one to active seeing rather than to quiet listening and reflecting. The attendance, therefore, at such conventions in the past has been disappointing. Furthermore, with the public mind fully occupied with one all-absorbing topic it has been difficult to rouse the local interest necessary to a successful convention of more than modest pretensions.

With the full knowledge of all these drawbacks an educational convention was planned early in the history of the exposition. So assiduously and intelligently was it worked up that it is safe to say that in comparison with the extent of the exposition with which it was connected the Trans-Mississippi Educational Convention was the most successful one of the kind that has yet been held. The attendance was satisfactory and the average character of the papers presented was of a high order. The sessions covered three days, June 28, 29, and 30. Those dates were selected because they came just after the close of the schools, before the teachers had gone off on their vacations, and it was reasonable to expect that many might be induced to make Omaha the end of their annual summer trips, and that still others might stop on their way to the National Educational Association in Washington early in July. The result justified these expectations.

The plan of the convention was modeled after that of the National Educational Association meetings. General sessions were held each morning at Boyd's Theater, in the city, and each evening at the Auditorium at the exposition, the entrances of which were so arranged that persons from outside the grounds might attend without passing through the exposition gates. In addition to the general meetings, conferences on special subjects were held in the afternoons at various places in the city. The attendance at some of these was not as great as they deserved, but, on the whole, it was better than could have been reasonably expected. Altogether the convention might be pronounced a distinct success, and that success was due principally to the efforts of the local executive committee, namely: C. G. Pearse, superintendent of city schools, Omaha, chairman; J. M. Gillan, secretary of the board of education, Omaha, secretary; J. H. Dumont, treasurer; W. R. Jackson, State superintendent of public instruction; Victor Rosewater, managing editor Omaha Bee; J. E. Utt, secretary of the Commercial Club.

THE EXHIBIT OF THE BUREAU OF EDUCATION.

The Bureau of Education was originally established for the collection and diffusion of educational information; but it has also been charged by Congress with the administration of the schools of Alaska, and with a limited supervision of the expenditures for land-grant colleges under the Morrill act of 1890. While the first of these is the most important and far-reaching, it is the most difficult to show in an exhibit; the last, while important in itself, is but a small part of the Bureau's

Digitized by Google

work, and does not require very extensive illustration. The work which relates to Alaska has within it the germs of wide development; but up to this time the school system of Alaska can not be said to be comparable in extent or importance with that of either of the States, or with the other work of the Office itself. Nevertheless, the peculiar conditions of education in that Territory, and its population by races so entirely different in habits, customs, and dress from our own, make the Alaskan side of the Bureau's work peculiarly useful for exhibition purposes. About half of the space allotted to this Office, therefore, was devoted to material illustrating the conditions of life and of education in Alaska, while the remaining half was nearly equally divided between the exhibits of land-grant colleges and the statistical and other material intended to "diffuse educational information" of a general character.

The most conspicuous statistical feature of the exhibit was a large wall chart 4 feet wide and 10 feet high, on which was set forth the progress of education in twenty years in the north central division of the United States. In a series of wing frames, near by, were 40 smaller charts showing educational statistics of a miscellaneous character. These were all done in bright colors, with graphic diagrams in great variety, so that the striking appearance of the charts themselves might attract attention to the statistics presented. Many of the charts were of special local interest, though such as could not be easily prepared except in the Bureau of Education. The local sheets were placed conspicuously, in order to strike the attention of the visitor and lead him to examine the others. Two map cases, on the wall, contained eight maps, which showed the distribution of educational agencies and conditions in the United States. They were devoted, respectively, to public schools, secondary schools, colleges and universities, schools of medicine, of dentistry, and of pharmacy, schools of theology and of law, normal schools, public libraries, and illiteracy. The cases used for these maps, as well as the maps themselves, were those used at the two previous expositions, and have been already described in my reports. The remaining wall space was filled with pictures of historical school punishments and of school buildings. The first series of these comprised 20 water colors, by Mr. Felix E. Mahoney, and illustrated spanking, shaking, horsing, the Eton block, standing on one foot, the dunce cap, the bastinado, etc. The other series were also in water color, and were executed by Mr. Spencer B. Nicholls. They showed the development of school architecture, and included the log-cabin school, the interior of the same, a prairie "dugout," the little red schoolhouse, a city school of thirty years ago, and a modern school building.

A set of the publications of the Bureau was placed in a revolving bookcase in a prominent place, and not only showed to casual visitors the variety and extent of the work of the office, but they were frequently used for reference.

The data intended to be read in the exhibit itself were supplemented by a 10-page folder containing facts relating to education, which was gratuitously distributed. The information in this folder was of the sort most likely to be appreciated by general readers, and its distribution was, in my opinion, the most substantial and satisfactory innovation in this exhibit. Eleven thousand five hundred of the circulars were distributed, and though a great many of them were wasted, as might have been expected, I saw repeated evidences of valuable results from the distribution.

The presentation of land-grant colleges consisted of a collection of publications of those institutions and a series of cabinets containing photographs, charts, and drawings illustrating them. There were 12 of the cabinets, and the colleges represented in them were:

The Universities of Arizona, Illinois, Maine, Minnesota, Missouri, Nebraska, Nevada, Tennessee, and Wyoming; Maryland Agricultural College, Massachusetts Agricultural College, Massachusetts Institute of Technology, Michigan

Digitized by Google

Agricultural College, Montana Agricultural College, New Hampshire College of Agriculture and Mechanic Arts, Rutgers Scientific School, Agricultural and Mechanical College of Texas, Agricultural College of Utah, Alabama Normal and Industrial College for Colored Students, Southern University and Agricultural and Mechanical College, North Carolina Agricultural and Mechanical College for the Colored Race, South Carolina Agricultural College for Colored Students, Hampton Normal and Agricultural Institute, and Florida Normal and Industrial College.

As I have said, the Alaskan collection comprised half of the space of the exhibit. In attractiveness and in the number of visitors who were impressed by it, it comprised far more than half. The specimens were collected by Dr. Sheldon Jackson, the general agent of education in Alaska, and a large proportion of them were his own property, which he kindly loaned for the exhibit.

A unique feature of the educational effort in behalf of Alaska is the introduction of reindeer, by means of which it is hoped to transform the natives from a migratory to a pastoral people, and thus make their civilization and education easier. In illustration of this work, a large reindeer with a sled and a lay figure of a native driver were mounted in the most conspicuous position in the exhibit. Near it was a large case containing six lay figures clothed with typical Alaskan costumes, made of fur, fishskin, bird skins, buckskin, etc. Another case showed a collection of birds from Bering Sea mounted on an imitation of Alaskan rocks. A miscellaneous collection of ethnological specimens, consisting of bows, arrows, harpoons, implements, carvings, masks, fish traps, boats, houses, etc., filled four other cases and formed the body of the Alaskan exhibit. The formal work of education was illustrated by photographs of buildings, classes, and teachers, specimens of drawing, penmanship, etc., and by statistics. These articles were shown in wing frames.

In the manner of installation, it can not be said that any specially new devices were adopted. Furniture already on hand was used for the statistical charts, the pictures of Alaskan schools, and for the photographs of land-grant colleges. Three of the cases used for Alaskan specimens had been made for previous exhibits and four were made for this occasion, being designed for the special purposes which they served.

I am, sir, very respectfully,

J. C. BOYKIN, *Special Agent.*

The COMMISSIONER OF EDUCATION.

CHAPTER XXXIX.

FOREIGN UNIVERSITIES AND OTHER INSTITUTIONS OF HIGHER EDUCATION.

I. *Arranged according to date of founding.*
II. *Arranged according to number of students.*
III. *Arranged alphabetically.*
IV. *Arranged according to countries.*
V. *List of polytechnica.*
VI. *List of agricultural, forestry, and mining schools.*
VII. *List of veterinary schools.*

INTRODUCTION.

The authors of "Minerva, Jahrbuch der Universitäten der Welt" (K. Trübner), which is the chief source of information offered in the following lists, say that they have submitted their work at various stages of completion to different professors of the countries mentioned, so that they are assured that their decision as to which of the learned institutions of the world should be regarded as universities is upheld by the most trustworthy authority. They describe their Jahrbuch as a collection of names of teaching bodies, of universities, or similar institutions of the world.

Since this Report of the Bureau of Education contains direct information concerning the higher institutions of learning in the United States, they have been omitted from the following lists, which are devoted exclusively to foreign institutions.

I. *Foreign universities arranged according to age.*

Date of foundation.	Locality.
	Tenth century.
988	Cairo, Egypt.
	Twelfth century.
1119	Bologna, Italy.
1181	Montpellier, France.
1200	Paris, France.
1200	Oxford, England.
	Thirteenth century.
1209	Valencia, Spain.
1222	Padua, Italy.
1224	Naples, Italy.
1233	Toulouse, France.
1243	Salamanca, Spain.
1257	Cambridge, England.
1266	Perugia, Italy.
1288	Coimbra, Portugal.
	Fourteenth century.
1303	Rome, Italy.
1339	Grenoble, France.
1343	Pisa, Italy.
1346	Valladolid, Spain.
1348	Prague, Bohemia, Austria.
1349	Florence, Italy.
1361	Pavia, Italy.
1364	Cracow, Galicia, Austria.
1365	Vienna, Austria.
1367	Fünfkirchen, Hungary.
1386	Heidelberg, Baden, Germany.
1391	Ferrara, Italy.
	Fifteenth century.
1402	Würzburg, Bavaria, Germany.
1409	Leipsic, Saxony, Germany.
1409	Aix, France.
1411	St. Andrews, Scotland.
1412	Turin, Italy.
1419	Rostock, Mecklenburg, Germany.
1422	Parma, Italy.
1422	Besançon, France.
1426	Louvain, Belgium.
1431	Poitiers, France.
1437	Caen, France.
1444	Catania, Sicily, Italy.
1450	Barcelona, Spain.
1451	Glasgow, Scotland.
1456	Greifswald, Prussia, Germany.
1457	Freiburg, Baden, Germany.
1460	Basel, Switzerland.
1463	Nantes, France.
1465	Budapesth, Hungary.
1472	Bordeaux, France (1441).
1472	Munich, Bavaria, Germany.
1474	Saragossa, Spain.
1477	Upsala, Sweden.

NOTE.—The number of students in universities and schools not mentioned has not been ascertained.

III. *Foreign universities, etc., arranged alphabetically, with faculties and number of students.*

1. *Aberdeen, Scotland:* University of Aberdeen, 798 students. Philosophical, theological, law, and medical faculties; library.
2. *Aberystwith, Wales:* University College of Wales, with college at Bangor, 440 students.
3. *Adelaide, Australia:* University of Adelaide, 320 students. Observatory.
4. *Agram, Croatia, Hungary:* Königl. Universität Agram, 564 students. Theological, law, and philosophical faculties; library.
5. *Aix-en-Provence, France:* Facultés d'Aix, 849 students. Law and philosophical faculties; library.
6. *Algiers, Algeria, Africa:* Académie d'Alger, 763 students. Law, medical, scientific, and philosophical faculties; library, observatory.
7. *Allahabad, India:* University of Allahabad. Examining board, 3,423 candidates.
8. *Amsterdam, Netherlands:* Universiteit te Amsterdam, 1,124 students. Law, medical, scientific, philosophical, and theological faculties; library and several institutes.
9. *St. Andrew's, Scotland:* University of St. Andrew's, 236 students. St. Salvador, St. Leonard's, and St. Mary's College.
10. *Angers, France:* Facultés Catholique Libres. Law, scientific, theological, and philosophical faculties; library.
11. *Athens, Greece:* National University, 3,556 students. Theological, law, medical, and philosophical faculties; public library.
12. *Bangor, Wales:* University College of North Wales.
13. *Barcelona, Spain:* Universidad de Barcelona, 1,887 students. Philosophical, law, scientific, medical, and pharmaceutical faculties; library.
14. *Basel, Switzerland:* Universität Basel, 529 students. Theological, law, medical, and philosophical faculties; public library.
15. *Belfast, Ireland:* Queen's College.
16. *Belgrade, Servia:* Serpska Kraljevska Velika Skola, 471 students. Philosophical, law, and technological faculties; library.
17. *Berlin, Prussia, Germany:* Königl. Friedr.-Wilhelms-Universität, 10,300 students. Theological, law, medical, and philosophical faculties: seminary for oriental languages, and eleven other seminaries; library and thirty-six university institutes and museums.
18. *Berne, Switzerland:* Universität Bern, 819 students. Catholic and Protestant theology, law, medical, and philosophical faculties; city libraries.
19. *Besançon, France:* Facultés de Besançon, 197 students. Scientific, philosophical, and medical faculties; library.
20. *Birmingham, England:* Mason College, 960 students. Arts and science, medical and dental faculties; library.
21. *Bologna, Italy:* Regia Università di Bologna, 1,469 students. Philosophical, scientific, law, medical, and pharmaceutical faculties; veterinary and engineers' schools; library.
22. *Bombay, India:* University of Bombay. Examining board, 1,228 candidates; five preparatory colleges.
23. *Bonn, Prussia, Germany:* Rheinische Friedr.-Wilhelms-Universität, 1,743 students. Protestant and Catholic theological, law, medical, and philosophical faculties; library and many institutes.
24. *Bordeaux, France:* Facultés de Bordeaux, 2,144 students. Law, medical, scientific, and philosophical faculties; library.
25. *Braunsberg, Prussia, Germany:* Königl. Lyceum Hosianum, 70 students. Theological and philosophical faculties; library.
26. *Breslau, Prussia, Germany:* Königl. Universität Breslau, 1,488 students. Catholic and Protestant theological, law, medical, and philosophical faculties; library.
27. *Bristol, England:* University College, 521 students (210 women). College faculty and medical school; library.
28. *Brussels, Belgium:* Université libre de Bruxelles, 1,316 students. Philosophical, law, scientific, medical, and pharmaceutical faculties; also polytechnical school; library.
29. *Bucharest, Roumania:* Universitatea din Bucuresti, 1,736 students. Scientific, philosophical, law, medical, and theological faculties; library.
30. *Budapesth, Hungary:* Királyi Magyar Tudomány-Egyetum, 4,407 students. Theological, law, medical, and philosophical faculties; library.
31. *Cadiz, Spain:* Facultad de Medicina (belonging to Seville). Medical faculty; library.
32. *Caen, France:* Facultés de Caen, 598 students. Law, scientific, and philosophical faculties; library.
33. *Cagliari, Sardinia, Italy:* Regia Università di Cagliari, 243 students. Law, medical, and scientific faculties; library.

Digitized by Google

34. *Cairo, Egypt:* Ázhar University, about 7,900 students and hearers.
35. *Calcutta, India:* University of Calcutta, 7,210 candidates, of whom 3,475 passed. Examining board; library.
36. *Cambridge, England:* University of Cambridge, 2,929 students. Schools of theology, law, oriental, classical, and modern philology, music, moral science, history and archæology, astronomy, physics, chemistry, mineralogy, biology, geology, and medicine; library.
37. *Camerino, Italy:* Libera Università degli Studi di Camerino, 234 students. Law, medical, and pharmaceutical faculties, and veterinary school; communal library.
38. *Cape Town, South Africa:* University of the Cape of Good Hope.
39. *Cardiff, Wales:* University of South Wales, 170 students. Philosophical and scientific faculties and department of engineering; library.
40. *Catania, Sicily, Italy:* Regia Università degli Studi di Catania, 902 students. Law, medical, scientific, and philosophical faculties; library.
41. *Christiania, Norway:* Kongelige Frederiks Universitet, 1,200 students. Theological, law, medical, philosophical, and scientific faculties; library.
42. *Clermont-Ferrand, France:* Facultés de Clermont, 257 students. Scientific and philosophical faculties; library.
43. *Coimbra, Portugal:* Universidade de Coimbra, 1,429 students. Theological, law, and scientific faculties; library.
Copenhagen. (See Kjøbenhavn.)
44. *Cordoba, Argentine:* Universidad Nacional. Law, scientific, and medical faculties; observatory.
45. *Cork, Ireland:* Queen's College, 212 students.
Cracow. (See Krakau.)
46. *Czernowitz, Bukowina, Austria:* K. k. Franz-Josephs-Universität, 390 students. Theological, law, and philosophical faculties; library.
47. *Dijon, France:* Facultés de Dijon, 604 students. Law, scientific, and philosophical faculties; library.
48. *Dorpat (Jurjew), Russia:* Kaiserliche Universität, 1,334 students. Law, theological, medical, and philosophical faculties.
48. *Dublin, Ireland:* University of Dublin, 1,128 students.
50. *Dublin, Ireland:* Royal University of Ireland, about 600 candidates. Examining board.
51. *Dundee, Scotland:* University College, 181 students.
52. *Durham, England:* Durham University, 250 students. To this university belong the Codrington College, on the island of Barbadoes, and the Fourah Bay College, in Sierra Leone; also the College of Science, at Newcastle-on-Tyne, which has an enrollment of 1,500 students.
53. *Edinburgh, Scotland:* University of Edinburgh, 2,850 students. Philosophical, theological, law, and medical faculties; library.
54. *Eperies, Hungary:* Evangelische Rechtsakademie, 149 students. Law school.
55. *Erlangen, Bavaria, Germany:* K. Bayerische Friedr.-Alexander-Universität, 1,085 students. Theological, law, medical, and philosophical faculties; library.
56. *Erlau, Hungary:* Erzbischöfliche Rechtsakademie, 81 students. Law school.
57. *Ferrara, Italy:* Libera Università di Ferrara, 77 students. Law, scientific, and medical faculties; library.
58. *Florence, Italy:* R. Instituto di Studi Superiori Practici e di Perfezionamento, 623 students. Philosophical, scientific, medical, and pharmaceutical faculties; library.
59. *Freiburg, Baden, Germany:* Badische Albert-Ludwigs-Universität, 1,641 students. Law, theological, medical, and philosophical faculties; library.
60. *Freiburg, Switzerland:* Katholische Universität, 384 students. Theological, law, and philosophical faculties; library.
61. *Fünfkirchen, Hungary:* Bischöflische Rechtsakademie. Law school, 115 students.
62. *Galway, Ireland:* Queen's College.
63. *Geneva, Switzerland:* Université de Genève, 862 students. Theological, law, medical, philosophical, and scientific faculties; five libraries.
64. *Genoa, Italy:* R. Università degli Studi di Genova, 1,010 students. Law, medical, scientific, and philosophical faculties, and schools of engineering and pharmaceutics; library.
65. *Ghent, Belgium:* Université de Gand, 676 students. Philosophical, law, scientific, and medical faculties; library.
66. *Giessen, Hessia, Germany:* Hessische Ludwigs Universität, 764 students. Theological, law, medical, and philosophical faculties; library.
67. *Glasgow, Scotland:* University of Glasgow, 1,820 students.
68. *Gothenburg, Sweden:* Göteborgs Högskola, 457 hearers.
69. *Göttingen, Prussia, Germany:* Georg-Augusts-Universität, 1,230 students. Theological, law, medical, and philosophical faculties; library.
70. *Granada, Spain:* Universidad de Granada, 1,531 students. Philosophical, law, scientific, medical, and pharmaceutical faculties; library.
71. *Grätz, Styria, Austria:* K. k. Karl-Franzens-Universität, 1,771 students. Theological, law, medical, and philosophical faculties; library.
72. *Greifswald, Prussia, Germany:* Universität, 879 students. Theological, law, medical, and philosophical faculties; library.
73. *Grenoble, France:* Facultés de Grenoble, 476 students. Law, scientific, and philosophical faculties; library.
74. *Groningen, Netherlands:* Rijks Universiteit te Groningen, 428 students. Theological, law medical, scientific, and philosophical faculties; library.
75. *Grosswardein, Hungary:* Jógakademia, 176 students. Law school.
76. *Halle, Prussia, Germany:* Friedr.-Universität Halle-Wittenberg, 1,700 students. Theological, law, medical, and philosophical faculties; library.
77. *Havana, Cuba:* Universidad de la Habana, 671 alumnos and 555 under private tutors. Philosophical, scientific, medical, and law faculties; library.
78. *Heidelberg, Baden, Germany:* Ruprecht-Karls-Universität, 1,202 students. Theological, law, medical, philosophical, and scientific faculties; library.
79. *Helsingfors, Finland, Russia:* Kejserliga Alexanders Universitet i Finland, 2,135 students. Theological, law, medical, and philosophical faculties; public library.
80. *Innspruck, Tyrol, Austria:* K. k. Leopold-Franzens-Universität, 1,009 students. Theological, law, medical, and philosophical faculties; library.
81. *Jaroslaw (or Yaroslav), Russia:* Demidovskij juridiceskij Liccj, 269 students. Law school.
82. *Jassy, Roumania:* Universitatea din Jasi, 420 students. Law, philosophical, scientific, and medical faculties; library.

83. *Jena, Thuringia, Germany:* Sächsische Gesammt-Universität, 815 students. Theological, law, medical, and philosophical faculties; library.
Jurjew. (See Dorpat.)
84. *Kasan, Russia:* Imperatorskij Kazanskij Universitet, 850 students. Philosophical, scientific, law, and medical faculties; library.
85. *Kaschau, Hungary:* Rechts-Akademie, 135 students. Law school.
86. *Kecskemet, Hungary:* Rechts-Akademie, 96 students. Law school.
87. *Kharkov, Russia:* Imperatorskij Charkowskij Universitet, 1,576 students. Philosophical, scientific, law, and medical faculties; library.
88. *Kiel, Prussia, Germany:* K. Christian-Albrechts-Universität, 861 students. Theological, law, medical, and philosophical faculties; library.
89. *Kiev, Russia:* Imperatorskij Universitet, 2,565 students. Medical, law, and philosophical faculties; institutes and library.
90. *Kingston, Ontario, Canada:* University of Queen's College, 589 students. Theological, arts, law, and medical faculties; museum.
91. *Kjöbenhavn (Copenhagen), Denmark:* Kjöbenhavns Universitet, about 2,000 students. Theological, law, medical, philosophical, and scientific faculties and polytechnic institute; library.
92. *Klausenburg, Siebenbürgen, Hungary:* K. k. Klausenburger Universität, 833 students. Law, medical, philosophical, and scientific faculties; library.
93. *Königsberg, Prussia, Germany:* K. Albertus Universität, 733 students. Theological, law, medical, and philosophical faculties; royal and university library.
94. *Krakau, Galicia, Austria:* Jagellonische Universität, 1,427 students. Theological, law, medical, and philosophical faculties; library.
95. *Lahore, India:* The Punjab University, 1,135 candidates, of whom 863 passed. Oriental languages, arts, law, medicine, science, and engineering departments.
96. *Lampeter, Wales:* St. David's College, 125 students.
97. *Lausanne, Switzerland:* Université de Lausanne, 584 students. Theological, law, medical, philosophical, and scientific faculties.
98. *Leeds* (see Manchester), *England:* Yorkshire College, 1,110 students.
99. *Leyden, Netherlands:* Rijks-Universiteit, 816 students. Medical, scientific, philosophical, theological, and law faculties; library.
100. *Leipsic, Saxony, Germany:* Universität, 3,277 students. Theological, law, medical, and philosophical faculties; library.
101. *Lemberg, Galicia, Austria:* K. k. Franzen's Universität in Lemberg, 1,507 students. Theological, law, and philosophical faculties; library.
Liége. (See Lüttich.)
102. *Lille, France:* Facultés de Lille, 1,354 students. Law, medical, scientific, and philosophical faculties; library.
103. *Lille, France:* Facultés Libres. Theological, law, medical, scientific, and philosophical faculties; library.
104. *Lima, Peru:* Universidad Mayor de San Marcos. Theological, law, medical, and philosophical faculties.
105. *Limoges, France:* École de Médécine et de Pharmacie. Medical and pharmaceutical courses.
106. *Liverpool* (see Manchester). *England:* University College, about 1,000 students.
107. *London, England:* University of London, about 5,000 candidates. Examining board; library.
To the university belong:
(1) University College, with philosophical, law, scientific, and medical faculties; library; about 1,500 students.
(2) King's College, with theological, philosophical, and medical faculties; library.
(3) School of Modern Oriental Languages.
(4) College of Preceptors.
(5) Seven medical schools, connected with hospitals.
108. *Louvain, Belgium:* Université Catholique de Louvain, 1,669 students. Theological, law, medical, philosophical, and scientific faculties; library.
109. *Lund, Sweden:* Kongl. Universitet i Lund, 665 students. Theological, law, medical, and philosophical faculties; library.
110. *Lüttich* (or *Liége*), *Belgium:* Université de Liége, 1,424 students. Philosophical, law, scientific, and medical faculties; library.
111. *Lyons, France:* Facultés Libres, 1,514 students. Theological, law, scientific, and philosophical faculties.
112. *Lyons, France:* Facultés de Lyon, 2,198 students. Law, medical, scientific, and philosophical faculties; two libraries.
113. *Macerata, Italy:* Regia Università di Macerata, 255 students. Law faculty.
114. *Madras, India:* University of Madras, about 4,000 candidates. Examining board.
115. *Madrid, Spain:* Universidad Central de España, 6,143 candidates. Philosophical, law, scientific, medical, and pharmaceutical faculties; libraries.
116. *Manchester, Liverpool, and Leeds, England:* Victoria University, about 3,000 students. This institution consists of:
(1) Owens College, Manchester, 1,063 students.
(2) University College, Liverpool, about 1,000 students.
(3) Yorkshire College, Leeds, 1,110 students.
117. *Manila, Philippine Islands:* Real y Pontificia Universidad de Santo Tomás de Manila, 1,144 students. Theological, law, medical, and pharmaceutical faculties; library.
118. *Marburg, Hessia, Germany:* Universität Marburg, 1,172 students. Theological, law, medical, philosophical, and scientific faculties; library.
119. *Marseilles, France:* Belongs to Facultés d'Aix. Scientific, medical, and law faculties; library.
120. *Melbourne, Victoria, Australia:* University of Melbourne. 714 students.
121. *Messina, Italy:* Regia Università degli Studi di Messina, 602 students. Law, medical, scientific, philosophical, and pharmaceutical faculties; library.
122. *Mexico, Mexico:* Instituto Médico Nacional. Medical faculty.
123. *Modena, Italy:* Regia Università degli Studi di Modena, 412 students. Law, medical, scientific, and pharmaceutical faculties; library.
124. *Montauban, France:* Belongs to Facultés de Toulouse, 43 students. Law, medical, scientific, and philosophical faculties; library.
125. *Montevideo, Uruguay:* University, 132 students. Medical, law, and mathematical faculties; library.
126. *Montpellier, France:* Facultés de Montpellier, 1,496 students. Law, medical, scientific, and philosophical faculties; library.

Digitized by Google

127. *Montreal, Canada:* McGill College and University, 1,097 students.
128. *Moscow, Russia:* Imperatorskij Moskowskij Universitet, 4,461 students. Philosophical, scientific, law, and medical faculties; library.
129. *Moscow, Russia:* Duchovnaja Akademija. Theological faculty; library.
130. *Munich, Bavaria, Germany:* K. Bayerische Ludwig-Maximilians Universität, 4,185 students. Theological, law, medical, and philosophical faculties; library.
131. *Münster, Prussia, Germany:* K. Preussische Theologische und Philosophische Akademie, 544 students. Theological and philosophical faculties; library.
132. *Nancy, France:* Facultés de Nancy, 1,001 students. Law, medical, scientific, and philosophical faculties, and pharmaceutical school; library.
133. *Nantes, France:* École de Médecine de Nantes.
134. *Nantes, France:* École Libre de Droit:
135. *Naples, Italy:* Regia Università degli Studi di Napoli, 5,103 students. Philosophical, law, mathematical, scientific, and medical faculties, and pharmaceutical school; library.
136. *Neuchâtel, Switzerland:* Académie de Neuchâtel, 149 students. Philosophical, scientific, theological, and law faculties; library.
137. *Newcastle, England:* The colleges belong to Durham University.
(1) College of Medicine, 201 students.
(2) Durham College of Science, 200 students.
138. *New Zealand:* University, consisting of four colleges.
139. *Nottingham, England:* University College, 1,902 students. Philology, law, and scientific faculties, and school of engineering; free public libraries.
140. *Odessa, Russia:* Noworossijskij Universitet, 581 students. Philosophical, scientific, and law faculties; library.
141. *Olmütz, Moravia, Austria:* Theologische Facultät, 229 students.
142. *Oviedo, Spain:* Universidad Literaria, 235 students. Law faculty; library.
143. *Oxford, England:* University, 3,406 students. Theological, law, medical, scientific, and philophical faculties; Bodleian library.
144. *Padua, Italy:* Regia Università degli Studi di Padua, 1,587 students. Law, medical, scientific, and philosophical faculties, and schools of engineering and pharmacy; library.
145. *Palermo, Sicily, Italy:* Regia Università degli Studi di Palermo, 1,395 students. Law, medical, scientific, and philosophical faculties, and schools of engineering and pharmacy; library.
146. *Paris, France:* (1) Université de Paris, 12,047 students. Protestant theological, law, medical, scientific, and philosophical faculties, and schools of engineering and pharmacy; libraries.
147. *Paris, France:* (2) Facultés libres. Law and philosophical faculties; library.
148. *Paris, France:* (3) Collége de France.
149. *Paris, France:* (4) École Libre de Sciences Politiques.
150. *Paris, France:* (5) École pratique des hautes études en Sorbonne, 233 students. Philosophical and theological faculties; library.
151. *Paris, France:* (6) École nationale des beaux-arts.
152. *Paris, France:* (7) École nationale de chartes.
153. *Paris, France:* (8) École du Louvre.
154. *Paris, France:* (9) École des langues orientales vivantes and other special schools.
155. *Parma, Italy:* Regia Università degli Studi di Parma, 554 students. Law, medical, and scientific faculties, and veterinary and pharmaceutical schools.
156. *Pavia, Italy:* Regia Università degli Studi di Pavia, 1,325 students. Law, medical, scientific, and philosophical faculties; pharmaceutical school and library.
157. *Perugia, Italy:* Università Libera degli Studi di Perugia, 298 students. Law and medical faculties, and pharmaceutical and veterinary schools; library.
158. *St. Petersburg, Russia:* Imperatorskij Universitet, 3,700 students. Philosophical, scientific, law, and oriental languages faculties; library.
159. *St. Petersburg, Russia:* Imperatorskij Wozensio-Medicineskaja Akademja, 750 students. Medical faculty; library.
160. *St. Petersburg, Russia:* Theological Academy, 239 students; also a law school, 300 students, independent of the university.
161. *St. Petersburg, Russia:* Military medical school, 750 students.
162. *St. Petersburg, Russia:* Law Academy, 330 students, and several other special schools.
163. *Pisa, Italy:* Regia Università degli Studi di Pisa, 1,066 students. Law, philosophical, medical, and scientific faculties, and engineering, pharmaceutical, veterinary, and agricultural schools; library.
164. *Poitiers, France:* Facultés de Poitiers, 764 students. Law, scientific, and philosophical faculties; library.
165. *Prague, Bohemia, Austria:* K. k. Deutsche Carl-Ferdinands Universität, 1,336 students. Theological, law, medical, and philosophical faculties; library.
166. *Prague, Bohemia, Austria:* C. k. česk Universitet Karlo-Ferdinandovij, 2,858 students. Theological, law, medical, and philosophical faculties; library.
167. *Pressburg, Hungary:* Jógakademia, 170 students. Law and philosophical faculties; library.
168. *Quebec, Canada:* Université Laval, 231 students. Theological, law, medical, and arts faculties; library and museum.
169. *Recife, Brazil:* Faculdade de direito, 180 students. Law faculty.
170. *Rennes, France:* Facultés de Rennes, 1,063 students. Law, scientific, and philosophical faculties; library.
171. *Rome, Italy:* Regia Università degli Studi di Roma, 1,914 students. Philosophical, scientific, law, and medical faculties; engineering and pharmaceutical schools; library,
172. *Rome, Italy:* A number of colleges supported by the church; also a woman's university with 94 students.
173. *Rostock, Mecklenburg, Germany:* Grossherzogliche Universität, 469 students. Theological, law, medical, and philosophical faculties; library.
174. *Salamanca, Spain:* Universidad de Salamanca, 1,247 students. Philosophical and law faculties; library.
175. *Salzburg, Austria:* Theologische Fakultät, 74 students.
176. *Santiago, Chile:* University with 4 faculties and 1,000 students.
177. *Santiago, Spain:* Universidad de Santiago. Law, medical, and pharmaceutical faculties; library.
178. *Saragossa, Spain:* Universidad de Zaragoza, 966 students. Philosophical, law, medical, and scientific faculties; provincial library.

179. *Sarospatak, Hungary:* Theologische und Rechtsschule, 116 students.
180. *Sassari, Italy:* Regia Università degli Studi di Sassari, 163 students. Law, medical, and scientific faculties; library.
181. *Seville, Spain:* Universidad de Sevilla. Philosophical, law, and scientific faculties; library.
182. *Sheffield, England:* University College (belongs to Oxford University), 450 students; also a medical school.
183. *Siena, Italy:* Regia Università degli Studi di Siena, 231 students. Law and medical faculties and pharmaceutical school; library.
184. *Sophia, Bulgaria:* Wische utschillische w Sophia, 354 students.
185. *Stockholm, Sweden:* Stockholms Högs Kola, 337 students.
186. *Stockholm, Sweden:* Medical Institute, 307 students.
187. *Strasburg, Alsace, Germany:* Kaiser Wilhelms Universität, 1,159 students. Theological, law, medical, philosophical, and scientific faculties; provincial library.
188. *Sydney, New South Wales, Australia:* University of Sydney, 455 students.
189. *Tokio, Japan:* Teikoku, Daigaku, 1,895 students. Law, medical, philosophical, and scientific faculties and school of engineering; library.
190 *Tomsk, Siberia:* Imperatorskij Tomkij Universitet, 336 students. Theological and medical faculties; library.
191. *Toronto, Canada:* University of Toronto, 1,322 students. Philosophical, law, and medical faculties; library.
192. *Toronto, Canada:* Victoria University, 250 students. Arts and theology; library.
193. *Toronto, Canada:* Two medical schools.
194. *Toulouse, France:* Facultés de Toulouse, 1,885 students. Law, philosophical, scientific, and medical faculties; library.
195. *Toulouse, France:* Facultés Libres Catholiques. Theological and philosophical faculties; library.
196. *Tübingen, Würtemberg, Germany:* K. Eberhard Karls Universität, 1,257 students. Theological, law, medical, philosophical, and scientific faculties; library.
197. *Turin, Italy:* Regia Università degli Studi di Torino, 2,551 students. Law, medical, philosophical, and scientific faculties and pharmaceutical school; library.
198. *Upsala, Sweden:* Kongl. Universitet i Upsala, 1,504 students. Theological, law, medical, and philosophical faculties; library.
199. *Urbino, Italy:* Libera Università degli Studi di Urbino, 93 students. Law and mathematical faculties and pharmaceutical and surgical schools; library.
200. *Utrecht, Netherlands:* Rijks Universität te Utrecht, 872 students. Philosophical, medical, theological, law, and scientific faculties; library.
201. *Valencia, Spain:* Universidad de Valencia, 726 students. Law, scientific, and medical faculties; library.
202. *Valladolid, Spain:* Universidad de Valladolid. Law and medical faculties; library.
203. *Vienna, Austria:* K. k. Universität, 5,710 students. Law, theological, medical, and philosophical faculties; library and numerous university institutes.
204. *Vienna, Austria:* Protestantische Theologische Fakultät, 22 students.
205. *Vienna, Austria:* K. k. Orientalische Akademie, 25 students; also Lehranstalt für Orientalische Sprachen, 128 students.
206. *Warsaw, Poland, Russia:* Imperatorskij Warschawskij Universitet, 1,242 students. Philosophical, scientific, law, and medical faculties; library.
207. *Würzburg, Bavaria, Germany:* K. Julius-Maximilians Universität, 1,425 students. Theological, law, medical, and philosophical faculties; library.
208. *Zurich, Switzerland:* Schweizerische Hochshule, 876 students. Theological, law, medical, and philosophical faculties; cantonal and city libraries.

IV. *Foreign universities arranged according to countries.*

Argentina: Cordoba.
Australia: Adelaide, Melbourne, Sydney.
Austria: Czernowitz, Grätz, Innspruck, Cracow, Lemberg, Olmütz, Prague (German), Prague (Bohemian), Salzburg, Vienna.
Belgium: Brussels, Ghent, Liège, Louvain.
Bolivia: (Universities not mentioned in "Minerva.")
Brazil: Recife.
Bulgaria: Sophia.
Canada: Kingston, Montreal, Quebec, Toronto.
Cape Colony: Cape City.
Chile: Santiago.
China: (College of Foreign Knowledge.)
Colombia: (Universities not mentioned in "Minerva.")
Corea: (None.)
Costa Rica: (None.)
Cuba: Havana.
Denmark: Copenhagen.
Ecuador: Quito.
Egypt: Cairo.
England: (See also Ireland, Scotland, and Wales below.) Birmingham, Bristol, Cambridge, Durham, Leeds, Liverpool, London, Manchester, Newcastle, Nottingham, Oxford, Sheffield.
France: Aix, Algiers, Angers, Besançon, Bordeaux, Caen, Clermont, Dijon, Grenoble, Lille, Limoges, Lyons, Marseilles, Montauban, Montpellier, Nancy, Nantes, Paris, Poitiers, Rennes, Toulouse.
Germany: Berlin, Bonn, Braunsberg, Breslau, Erlangen, Freiburg, Giessen, Göttingen, Greifswald, Halle, Heidelberg, Jena, Kiel, Königsberg, Leipsic, Marburg, Munich, Münster, Rostock, Strasburg, Tübingen, Würzburg.
Greece: Athens.
Guatemala: (None.)
Haiti: (None.)
Hawaii: (None.)
Honduras: (None.)
Hungary: Agram, Budapesth, Eperies, Erlau, Fünfkirchen, Grosswardein, Kaschau, Kecskemet, Klausenburg, Pressburg, Sarospatak.
India: Allahabad, Bombay, Calcutta, Lahore, Madras.
Ireland: Belfast, Cork, Dublin, Galway.

Italy: Bologna, Cagliari, Camerino, Catania, Ferrara, Florence, Genoa, Macerata, Messina, Modena, Naples, Padua, Palermo, Parma, Pavia, Perugia, Pisa, Rome, Sassari, Siena, Turin, Urbino.
Japan: Tokio.
Mexico: (Schools of law, medicine, engineering, etc.)
Montenegro: (Theological seminary, not mentioned in "Minerva.")
Morocco: (None.)
Netherlands: Amsterdam, Groningen, Leyden, Utrecht.
New Zealand: One university.
Nicaragua: (None.)
Norway: Christiania.
Orange Free State: (None.)
Paraguay: (National college, not mentioned in "Minerva.")
Persia: (Several colleges, not mentioned in "Minerva.")
Peru: Lima.
Philippine Islands: Manila.
Portugal: Coimbra.
Roumania: Bucharest, Jassy.
Russia: Kharkov, Dorpat, Helsingfors, Yaroslav, Kasan, Kiev, Moscow, Odessa, St. Petersburg, Warsaw.
Salvador: (One university, not mentioned in "Minerva.")
Santo Domingo: (None.)
Scotland: Aberdeen, St. Andrews, Dundee, Edinburgh, Glasgow.
Servia: Belgrade.
Siam: (None.)
Siberia: Tomsk.
South African Republic: (None.)
Spain: Barcelona, Cadiz, Granada, Madrid, Oviedo, Salamanca, Santiago, Saragossa, Seville, Valencia, Valladolid.
Sweden: Gothenburg, Lund, Stockholm, Upsala.
Switzerland: Basel, Berne, Freiburg, Geneva, Lausanne, Neuchâtel, Zurich.
Turkey: (Several colleges, not mentioned in "Minerva.")
Uruguay: Montevideo.
Venezuela: (Universities not mentioned in "Minerva.")
Wales: Aberystwith, Bangor, Cardiff, Lampeter.

V. *Technological schools.*

Aachen (Aix-la-Chapelle), *Prussia, Germany*, founded 1870; 398 students.
Berlin, Prussia, Germany, founded 1770; 3,207 students.
Braunschweig, Germany, founded 1745; 390 students.
Brünn, Austria, founded 1850; 342 students.
Budapesth, Hungary, founded 1856; 1,454 students.
Copenhagen, Denmark, founded 1829; 431 students.
Darmstadt, Hessia, Germany, founded 1868; 1,332 students.
Delft, Netherlands, founded 1864; 428 students.
Dresden, Saxony, Germany, founded 1828; 1,001 students.
Grätz, Styria, Austria, founded 1811; 324 students.
Hanover, Prussia, Germany, founded 1879; 1,247 students.
Helsingfors, Finland, Russia, founded 1847; 220 students.
Karlsruhe, Baden, Germany, founded 1825; 1,071 students.
Kharkov, Russia, founded 1884; 641 students.
Lemberg, Galicia, Austria, founded 1844; 365 students.
Lisbon, Portugal, founded 1837.
London, England, founded 1884; 238 students.
Madrid, Spain, founded 1835; 235 students.
Milan, Italy, founded 1863; 441 students.
Moscow, Russia, founded 1832; 621 students.
Munich, Bavaria, Germany, founded 1827; 1,928 students.
Naples, Italy, founded 1863; 198 students.
Paris, France, founded 1794; three schools, with 377 students.
Oporto, Portugal, founded 1877; 322 students.
Prague, Bohemia, Austria, founded 1800 and 1868; 2 schools, with 1,297 students.
Riga, Russia, founded 1832; 1,370 students.
St. Petersburg, Russia, founded 1828; 4 schools, with 2,129 students.
São Paulo, Brazil, founded 1894; ——— students.
Sheffield, England, founded 1885; 750 students.
Stockholm, Sweden, founded 1798; 348 students.
Stuttgart, Würtemberg, Germany, founded 1829; 947 students.
Turin, Italy, founded ———; 380 students.
Vienna, Austria, founded 1815; 1,682 students.
Zurich, Switzerland, founded 1851; 1,330 students.

NOTE.—Several noted technological schools in Italy and in other countries are connected with universities, hence are not mentioned separately in this list.

VI. *Higher agricultural, forestry, and mining schools.*

[Figures in brackets signify date of founding.]

Altenburg, Hungary [1819], Agricultural Academy; 119 students.
Aschaffenburg, Bavaria, Germany [1844], Forestry Academy; 126 students.
Beauvais, France [1854], Agricultural Institute; 103 students.
Berlin, Prussia, Germany [1806], Agricultural Academy; 588 students.
Berlin, Prussia, Germany, [1860], Mining Academy.
Campinas, São Paulo, Brazil [1887], Agricultural Institution.
Clausthal, Prussia, Germany [1775], Mining Academy; 200 students.
Coopers Hill, England [1885], Forestry Academy.
Copenhagen, Denmark [1858], Veterinary and Agricultural Academy; 370 students.

Debreczin, Hungary [1865], Agricultural Academy; 98 students.
Eberswalde, Prussia, Germany [1820], Forestry Academy; 62 students.
Eisenach, Saxe-Weimar, Germany [1859], Forestry Academy; 24 students.
Evois, Finland, Russia [1859], Forestry Academy; 16 students.
Freiberg, Saxony, Germany [1765], Mining Academy; 276 students.
Gembloux, Belgium [1860], Agricultural Academy.
Grignon, France [1828], Agricultural Academy.
Hohenheim, Würtemberg, Germany [1818], Agricultural Academy; 101 students.
Keszthely, Hungary [1865], Agricultural Academy; 94 students.
Kolozsmonostor, Hungary [1869], Agricultural Academy; 100 students.
Leoben, Styria, Austria [1894], Mining Academy; 222 students.
Madrid, Spain [?], Schools of Engineering, Agriculture, and Veterinary Science.
Moscow, Russia [?], Agricultural and Forestry Academy; 182 students.
Münden, Prussia, Germany [1868], Forestry Academy; 48 students.
Nancy, France [1824], Forestry Academy; 27 students.
Nowaja-Alexandria, Poland, Russia [1892], Agricultural and Forestry Academy; 262 students.
Paris, France [?], Agricultural and Mining Academies; 403 students.
Poppelsdorf, Prussia, Germany [1846], Agricultural Academy; 347 students.
Pribram, Bohemia, Austria [1849], Mining Academy; 109 students.
Schemnitz, Hungary [?], Forestry and Mining Academy; 200 students.
St. Etienne, France [1816], Mining Academy; 20 students.
Stockholm, Sweden [1823], Forestry School; also Agricultural Academy [1811].
St. Petersburg, Russia [1773], Mining Institute; 450 students.
St. Petersburg, Russia [1880], Forestry Institute; 467 students.
Tharandt, Saxony, Germany [1811], Forestry Academy; 100 students.
Vienna, Austria [1872], Agricultural Academy; 352 students.

NOTE.—Other similar higher institutions of learning are connected with universities; hence they are not mentioned in this list of separate institutions.

VII. *Veterinary schools.*

Alfort, France [1766]; 281 students.
Berlin, Germany [1790]; 486 students.
Budapesth, Hungary [1786]; 380 students.
Copenhagen, Denmark [1850]; 370 students
Cordoba, Spain [1802]; —— students.
Dorpat, Russia [?]; 260 students.
Dresden, Germany [1774]; 219 students.
Hanover, Germany [?]; 230 students.
Kasan, Russia [?]; 399 students.
Leon, Spain [?]; 99 students.
Madrid, Spain [?]; 750 students.
Milan, Italy [1791]; 128 students.
Munich, Germany [1790]; 280 students.
Naples, Italy [?]; 230 students.
Stockholm, Sweden [1821]; —— students.
Stuttgart, Germany [1821]; 90 students.
Turin, Italy [?]; 91 students.
Utrecht, Netherlands [?]; 56 students.
Vienna, Austria [?]; 635 students.

CHAPTER XL.

REPORT ON EDUCATION IN ALASKA.

DEPARTMENT OF THE INTERIOR,
BUREAU OF EDUCATION, ALASKA DIVISION,
Washington, D. C., June 30, 1898.

SIR: I have the honor to submit the thirteenth annual report of the United States general agent of education in Alaska, for the fiscal year ending June 30, 1898.

There is in Alaska a school population of from 8,000 to 10,000; of these 1,250 were enrolled in the 18 Government schools in operation during the fiscal year.

Point Barrow.—H. R. Marsh, M. D., teacher; enrollment, 68; population, Eskimo. In September, 1897, eight vessels of the Arctic whaling fleet were caught in the ice near Point Barrow. The quartering in the schoolroom of men from the imprisoned ships and the frequent calls upon Dr. Marsh for professional services interfered with the routine of school work. Dr. Marsh reports: "School opened on September 13 with a good attendance, but before the end of the month the crews of the *Orca* and the *Freeman* were here, and nearly half the village people were sent inland to hunt in order to provide food for the whalers, taking their families with them. In October Captain Mason of the *Jeanie* sent for me to see a sick man, and I was out a week there. I observed the usual Thanksgiving and Christmas intermissions, though tempted to keep school every day. As I had been holding a night school for the sailors during October, November, and December, I felt that I needed the rest and so did not keep school during the holidays. On January 31 such a blizzard raged that not a person came near the house. The next day the whaler *Navarch* drifted in with the ice, and for three days not a child old enough to carry anything was seen in the village. Every one—men, women, and children—went out to the vessel and carried to shore on sleds or on their backs everything on the vessel that was movable. During February the rest of the villagers went inland to hunt. Only six school children remained. I kept school for a few days with them, but soon the boys left to join the parents, and I closed the school."

St. Lawrence Island.—In July, 1894, Mr. V. C. Gambell, of Wapello, Iowa, was appointed to open a Government school on St. Lawrence Island. For three years Mr. and Mrs. Gambell did faithful, efficient work among the half-civilized natives of this barren island, with no communication with the outside world during eight months of the year. In August, 1897, they returned to Iowa in order that Mrs. Gambell might receive necessary medical treatment. Mrs. Gambell's health having been restored, they decided to return to their work on St. Lawrence Island, leaving Seattle May 19 on the sailing vessel *Jane Grey*. Off Cape Flattery a gale was encountered, and at 2 o'clock of the morning of the 22d the alarm was given that the vessel had sprung a leak and was sinking. Twenty-six persons succeeded in embarking in a launch and subsequently reached Vancouver Island and were saved. In ten minutes after the alarm was given the *Jane Grey* sank, taking with her Mr. and Mrs. Gambell and about thirty other passengers. By the death of Mr. and Mrs. Gambell educational work in Alaska has suffered a great loss.

Digitized by Google

Port Clarence (Teller Reindeer Station.)—T. L. Brevig, teacher; enrollment, 50; population, Eskimo. The scarcity of food in the vicinity of the station and the consequent migration of many of the families to summer hunting grounds earlier than usual caused the school to be closed on April 1. On the return of the revenue cutter *Bear* from its Arctic cruise, Captain Tuttle, at the request of Dr. Sheldon Jackson, kindly received on board for passage to Seattle five of the best pupils of this school. Dr. Jackson subsequently took these Eskimo children to Carlisle, Pa., where they were received into the well-known industrial school under the superintendence of Maj. R. H. Pratt, U. S. A.

Unalaska.—Miss M. E. Mellor, teacher, and Miss Ada Mellor, assistant; enrollment, 68; population, Aleut. The following is Miss Mellor's report: "During the summer vacation I took five of our more advanced pupils to the Indian school at Carlisle, Pa., and one to Chicago, to be educated by Mr. P. B. Weare, of that city. During my absence in the States the bishop of the Russian church, who had visited Unalaska, authorized the priest to request me to teach English in the Russian school for one hour each day at the close of my own school hours. This I declined to do for lack of time and strength, and suggested that the priest send the Russian children to the Government school for the afternoon session. After some deliberation this was done. The Russian children were, however, subsequently removed. I called on the priest in regard to the matter, and the only reason he gave for his action was the fact that the teachers of the schools boarded at the Jesse Lee Home—hardly a good excuse, as there is no official connection whatever between the Government school and the Home. The Home is the only place in the village where the teachers can board with comfort. It seems a pity that these 34 children, most of whom are boys, should thus be deprived of the benefits of an English education. Now that the fur trade is diminishing, most of the native men of Unalaska are employed in loading and unloading vessels for the various commercial companies, and a knowledge of English is very essential. It would seem that a law making an education in English compulsory would be of great benefit to the people of Unalaska.

"Various public exercises were held during the year under the auspices of the school, resulting very beneficially to the children, affording pleasure to a large number of persons, and greatly increasing public interest in the work of the school. The first of these was a flag raising, November 6, at the Jesse Lee Home. The school was assisted by the Unalaska brass band, under the leadership of Mr. N. Gray, agent for the Alaska Commercial Company, to whom we were indebted for this inspiring addition to our programme. The arrival of the *Bear*, December 9, while en route to the Arctic with the overland relief expedition to the whalers off Point Barrow, made an unusually bright Christmas possible for the children of Unalaska. Captain Tuttle brought two large Christmas trees from Seattle for the Government school, besides a large donation of Christmas gifts. The latter came from the school children and others in Seattle, collected through the kindly interest of Captain Tuttle and the manager of the Post-Intelligencer. The entertainment was held on Christmas Eve, and was a very happy and successful occasion. The Russian school attended in a body, and after our festivities were over the Christmas trees were given to them to be used in their celebration. On Christmas day, accompanied by one of the girls as interpreter, I visited every house in the village, distributing presents to all the children who could not attend the entertainment on the previous evening. So this year, for the first time, every child in Unalaska was remembered at Christmas. February 22 was celebrated by an appropriate entertainment, the school being assisted by Captain Tuttle and the officers of the *Bear*. The chapel of the Jesse Lee Home, in which the entertainment was held for lack of room in the schoolhouse, was beautifully decorated with flags of all nations, kindly loaned by Captain Tuttle, while a large crayon portrait of Washington, the work of Mr. James C. Blaine, United States deputy

Digitized by Google

marshal, occupied a prominent place above the platform. Captain Tuttle presided, and addresses were made by Captain Tuttle, Lieutenant Berry, and Captain Ferguson. National songs, quotations from Americans of note, incidents in the life of Washington (including a short biography), were some of the numbers rendered by the school children. Instrumental music was given by the orchestra of the *Bear*. Over 200 persons were present, including the priest and the Russian school. Admission was by invitation.

"The closing exercises of the school were held in the evening of June 20, and were very largely attended. Forty-eight dollars and seventy-five cents were contributed for the purchase of books for a school library.

"Of the studies pursued during the year, special attention has been given to English, phonetics, reading, and the reproduction by recital or writing of short stories read and explained to the class by the teacher, also to letter-writing. Interest in the latter has been stimulated by the exchange of letters between the pupils in the school and those who went to Carlisle last summer. Once a week copies of the Youth's Companion, St. Nicholas, or Black and White (a London illustrated paper) were distributed among the older pupils for an hour's independent reading, and invariably the teacher spent the larger part of the time in answering questions. The pupils enjoyed this hour so much that the depriving of individuals of it became a successful mode of punishment for misconduct. Very good progress has been made in arithmetic also. The highest class at the close of the term was working in denominate numbers. One afternoon of each week was devoted to sewing, and, in addition to practicing plain sewing, 30 sleeveless aprons and several boys' shirts were made, the boys being taught sewing at their own request. The introduction of the kindergarten system into the primary department of the school pleased the children and was productive of good results. Taking all things into consideration, this has been the most prosperous year that the school has had since I came to Unalaska, largely due to the fact that my assistant teacher, Miss Ada Mellor, proved herself a tireless worker and a very capable assistant in all the branches of activity for which I had occasion to call upon her. I trust that in the near future the Russian children will become regular attendants of the Government school and enjoy the privileges of the English education which it affords and which they so much need."

Unga.—O. R. McKinney, teacher; enrollment, 40; population, white. Mr. McKinney reports: "On January 4 I organized an evening school which met once a week for literary work. On Washington's birthday the school gave an exhibition which was the most successful in its history. During the entire term the condition of the school has been very satisfactory; there has been no sickness, and our pupils have consequently kept together better than ever before. Our school is very similar to a rural district school in New York or Pennsylvania, about the only difference being that there is never any contention over the affairs of the school. My patrons seem to have perfect confidence in me and have not during the seven years that I have been with them raised any objection or taken exception to anything that I have found it necessary to do. This, perhaps, would not be remarkable if they were ignorant Indians or Aleuts, but considering the fact that they are nearly all intelligent white people it is at least worthy of mention."

Kadiak.—C. C. Solter, teacher; enrollment, 72; population, Russian creoles. Mr. Solter writes: "Most of my pupils have been industrious and have made satisfactory progress. They have done work in drawing and writing of which any school might be proud. A few have made commendable progress in language, history, and geography. We had a Christmas festival, as usual. The house was crowded with visitors; all spent a very pleasant evening and went home happy. It was the only exercise we had to remind us of the meaning of the day. The Russian Church has Christmas services, but their Christmas comes twelve days later than ours. We organized a literary society during the winter, in which all

Digitized by Google

the Americans in the village as well as most of the pupils took part. The exercises consisted of recitations, readings, and music, both vocal and instrumental. The object of the society was principally that the pupils might have opportunities of appearing before an audience and gaining self-confidence thereby. All the meetings were crowded. Many of the Russians who could not understand English came to listen to the music, which was highly appreciated. Our last meeting was held on Washington's birthday, and was the most interesting programme of the season. Our meetings were discontinued later, partly on account of the Russian holidays. Although no exercises of a religious or political character were allowed in our meetings, yet the priest looked with disfavor upon our work, started a society of his own, and in other ways tried to discourage his members from taking part in the exercises. These meetings did much to relieve the monotony of the long winter evenings.

Afognak.—Miss Matrona Salamatoff, teacher; enrollment, 59; population, Russian creoles. This school was unavoidably closed from August, 1896, to September, 1897, during which time the children ran wild; consequently when it was reopened considerable strict discipline was necessary. Miss Salamatoff writes: "The many Russian Church holy days are very detrimental to school attendance. When services were held in the morning I had school in the afternoon and on Saturday mornings in order to make up for lost time. On February 22 we had a patriotic entertainment. I spoke to the pupils about Washington; what the Stars and Stripes mean to us; impressed them with the fact that we are all Americans, and that the President is our ruler.

"I first spoke in English, then in Russian, for the benefit of those who did not understand English. My remarks seemed to make an impression."

Sitka, No. 1.—Miss Cassia Patton, teacher; enrollment, 42; population, white, American and Russian. Miss Patton reports as follows: "The white children of Sitka lead lives more isolated than those of the natives; the water is not to them the highway that it is to the canoe paddlers. There being no roads into the surrounding country, many of the white children have never been out of sight of the village. They have heard of mines all their lives, as the fathers of the majority of them own ledges, yet not half a dozen of them have ever seen a mine, as a mountain trip is no child's play. The great Alaskan industry of salmon canning is known to them only by hearsay, as the nearest cannery is 40 miles distant. A few of the children have come to Sitka from the States, and have acquired much knowledge from observation. How to combine these differences in grades is a problem. Very few of the children have anything to read at home, so I have a small circulating library, which I find of much use. As a preventive of tardiness I read from some interesting book. Our present story is 'Beautiful Joe,' and has caused many of the little ones to hurry to school so as not to miss any of him. Many of the children speak Russian in their homes, and through their religious observances they are connected with the foreign nation whose flag their parents saw lowered from Baranoff Castle. In the schoolroom on every possible occasion we do honor to the Stars and Stripes. We observe Transfer Day in October and Treaty Day in March. I wish that every school in Alaska had a picture of Secretary Seward; then the men and women of the future State of Alaska—the boys and girls of to-day—will see that the father of Alaska is duly honored."

Sitka, No. 2.—Miss Flora Campbell, teacher; enrollment, 170; population, Thlinget. The following is Miss Campbell's report: "All through the winter the people have been constantly going and coming, taking their children with them, in their visits to neighboring villages, so that regularity of attendance has been very much interfered with. In April the Russian New Year festivals are celebrated, during which season there are a number of church festivals. Many of the pupils are members of the Russian Church, and do not come to school during these holy days. During the first part of the year the Russians had school for the

Digitized by Google

natives and built a schoolhouse near ours, expecting to run it in opposition to ours. Another interference with regularity of attendance was the herring industry, in the latter part of April. At that season millions of herring swim along this coast and deposit their eggs, which are not larger than turnip seed. The natives spread branches of hemlock in their course, leaving them in the water one or two days. Then they take up the branches covered with eggs and dry them. Afterwards the dry clusters of eggs are sold or exchanged for furs with natives from the interior.

"The native boys do not have as easy times as do the white boys. The former do all the work about the house, even the cooking. Those who come to school regularly are doing excellent work. I often visit the homes of the pupils. The parents seem to realize the benefit to be obtained from having a knowledge of the English language, yet they are very careless about compelling their children to attend school. Generally speaking, I know that the children are anxious to learn, and seem to be interested in their studies. They have ability and are willing workers. They memorize quickly, but do not like to do mental work. We have many amusing conversations, and there is busy work in sewing, netting, weaving, paper folding, and other kindergarten exercises. They are very backward in using what English they know, especially before strangers. Eight adults attended school. Their progress is slower than that of the children. They are, however, doing well and are interested in their books. The natives are naturally very fond of music, and the pupils derive great pleasure from the songs they learn in school."

Haines.—Miss Frances Willard, teacher; enrollment, 46; population, Thlinget. Haines is near the head of Lynn Canal, and during the greater part of the year thousands upon thousands of men poured through the village on their way to the gold fields of the Yukon Valley. Every able-bodied man and boy, and many women and girls also, left home and spent many months carrying supplies for the miners. Consequently the school was badly interfered with, only the very small children being in attendance. The English learned in the schools stood the natives in good stead in their dealings with the miners.

Hoonah.—Mrs. J. W. McFarland, teacher; enrollment, 141; population, Thlinget. Mrs. McFarland writes: "Our people were later getting settled last fall, owing to the gold excitement, and many tarried at the new mining towns of Dyea and Skagway packing for miners and doing other work. I did not notice, upon their return, that their morals were corrupted in any way. I have not seen an intoxicated native in our village this winter. I am sure that by working for the miners the natives gained a great deal financially, and many came home the proud owners of sloops, schooners, and Columbia River boats. Give the natives of Alaska a chance and they will do work equal to that of the white men. Before Christmas the storekeeper here told me that he had received $2,000 in cash from the natives.

"School opened September 6, and the attendance gradually increased to 141. I anticipated the early rush to the mines, which I knew would come in spring, and toward the close of the term kept school on Saturdays, with a very good attendance. Some of the older boys begged to be allowed the privilege of taking their books with them during the vacation so that they would not forget what they had learned. I am glad to report encouraging progress on the part of those who attended regularly. Little ones of 6 learned to read quite well in Collard's Beginners' Reader, a most excellent book, which I heartily recommend to teachers in Alaska. Our native policeman, Moses, rendered valuable assistance in gathering in the children, especially the boys, who were more interested in coasting than in coming to school.

"On February 14 the man-of-war *Wheeling*, Captain Sebree in command, steamed into the harbor. Governor Brady, Commissioner Tuttle, and Deputy Marshal Kostrometinoff were on board. They visited the school and the governor kindly addressed the school. In speaking to the parents he tried to impress them

Digitized by Google

with the importance of making the children attend regularly. Give us a compulsory law for Alaska and the teachers will see encouraging results from their labors and the children of the coming generation will be, in the fullest sense of the word, stronger morally, mentally, and physically."

Juneau, No. 1.—Miss Lizzie H. Harte and V. C. Gambell, teachers; enrollment, 72; population, white. During the first part of the year this school was in charge of Miss Harte. Owing to failing health Miss Harte resigned her position in January. Until April her place was taken by Mr. V. C. Gambell, who left Juneau for his former position on St. Lawrence Island. It is to be regretted that the exceedingly limited funds at the disposal of this Bureau render it impossible at present to organize at Juneau the high school grade that is desired.

Juneau, No. 2.—Miss Elizabeth Saxman, teacher; enrollment, 40; population, Thlinget. Miss Saxman writes: "My work has been so pleasant that it seems scarcely possible that I have closed my fifth term in Juneau. My school was not as large last term as I would have liked. This is accounted for by the fact that the mission children have had such a siege of sickness. Very few of the village children attended. Although we feel very much discouraged by the closing of the home, as we considered that the link between the village and the school, yet the public school may now mean more to them than it ever has before. There has always been a slight feeling of estrangement between the mission children and the village children, and the latter may now feel that the school is for them and care more about it. I have noticed that the full-blooded native children excel in writing, music, and drawing."

Douglas, No. 1.—Miss Kate Spiers, teacher; enrollment, 46; population, white. Miss Spiers reports as follows: "I find the pupils bright and interested in their work. The progress has been marked and rapid, especially in reading, drawing, and language. The parents are helpful and very willing to render any assistance possible. I am sorry to say that the school does not reach the older pupils. The room is small, and it is impossible to accommodate more than thirty pupils. There is great need of a new building centrally located. Were it not for the parochial school it would be impossible to accommodate the pupils who should be in school. A movement has been made by this school and School No. 2 to establish a school library. An entertainment was given on April 15, and a sufficient sum was realized to assure us a small library for next year."

Douglas, No. 2.—Miss Gertrude H. Spiers, teacher; enrollment, 25; population, white. The following is Miss Spiers's report: "I have just closed my first year's work in Douglas and am glad to be able to report a very successful year. I enjoy comfortable and commodious quarters, but the grounds should be improved and a playground arranged. In the daily work the most successful features have been reading, drawing, and German. Each class has read four or five books, including the Johonnot series, the Seaside and Wayside series, Old Greek stories, and Kipling's Jungle Book. The drawing, in addition to its supplementary use in physiology and geography, has included two lessons per week in sketching from objects. The German class, a fifth grade, has completed the Chicago German Reader, Book I. No attempt was made to teach the grammatical construction, except incidentally. The children enjoyed the work, and insisted on buying their own texts. The patrons and citizens are very loyal to the school and have cooperated very heartily in our library and Christmas entertainments. The only damage to the school property has been done by storms and the heavy blasting. Not even a window has been broken by any of the pupils."

Jackson.—Miss C. Baker, teacher; enrollment, 121; population, Thlinget. Miss Baker reports: "The majority of the natives of Jackson do not return from their summer fishing grounds until late in the season. Accordingly, I went to them, and during the month of September school was held at Hunter's Bay. We used

Digitized by Google

a large boathouse for a schoolhouse, and were quite comfortable. Soon the fish ceased to run; I returned to Jackson and opened school there, thinking that all the people would soon be at home. However, they were unusually slow about returning; the village did not fill up much before the middle of November. Soon after they seemed settled for the winter the Klinquan people invited them to a great 'potlatch.' The majority accepted the invitation and were absent several weeks. Very few children were left in the village. When they returned the Klinquans came with them. Then there were plenty of children, but an epidemic of measles broke out and many children died. After a time the measles ran their course and my schoolroom was full for a short time. In the early spring family after family went to the fishing grounds, until at the end of April I had no children at all. I heard that there was a large number of them at Klinquan, so I followed them and had a very interesting school there during the month of May. Had it not been for the neighboring cannery, I would have had a large school; all who could get employment went to work there. Never since I have had charge of the school have the people been so continually on the move as they have been this year; but they must make their living, and they must go where it can be obtained. I have very little trouble to get the children into school when they are in the village. They are bright, obedient, teachable boys and girls and make very good progress in reading, writing, and arithmetic. Some of the young men told me this spring when they left that if I had the school next year all the young married people were coming to school. I like to see the married natives ambitious, and shall, of course, do all that I can to help them, but I prefer children in school to grown men and women with families."

Saxman.—Mr. J. W. Young and Mrs. M. J. Wakefield, teachers; enrollment, 63; population, Thlinget. Mr. Young writes: "In presenting my annual report I have nothing unusual or sensational to report. We have had a quiet year of work and have made fair progress. I was afraid that after the novelty of the school had worn off that the interest of the natives would diminish, but it seems to be as strong as it was at first. Several things have occurred to draw the natives away from Saxman, the chief of which is the Klondike gold excitement. While the natives from this place did not go into the interior, a large number of them went to Dyea and other points to pack and do other work for the miners. The jealousy between the chiefs of the two tribes that we have been trying to gather here caused some trouble and may result in the withdrawal of the entire Tongass tribe. Our people have been remarkably healthly during the past winter. While other towns had epidemics of measles and the grip, we have been entirely free from them. On the whole, the year has been one of progress in education and civilization, and the future looks bright."

Fort Wrangell.—Miss Anna R. Kelsey, teacher; enrollment, 71; population, Thlinget. Fort Wrangell is situated near the mouth of the Stikeen River and was the disembarking point of those who wished to take that route into the interior. School work was rendered difficult by reason of the inevitable confusion and distraction resulting from the tide of immigration that swept through the hitherto quiet village.

SCHOOLS NEEDED IN THE YUKON VALLEY.

During the past two years, the development of gold mining has attracted into the interior of Alaska thousands of miners, many of them bringing their families with them. In the vast region drained by the Yukon and its tributaries there is not a single school for white children, nor is it possible with the present appropriation of $30,000 to make any addition to the school system. As a result of the influx of population, towns have sprung up at St. Michael, Circle, Rampart, Peavy, Weare, and Eagle, and schools are urgently needed at these points.

Golovin Bay.—N. O. Hultberg, Mrs. N. O. Hultberg, P. H. Anderson, Gabriel Adamson.

Unalaklik.—A. E. Karlsen, Mrs. A. E. Karlsen, August Anderson, Miss Malvina Johnson, David Johnson, Miss Alice Omekejook (Eskimo).

Yakutat.—K. J. Hendrikson, Albin Johnson, Mrs. Albin Johnson.

Kangekosook.—Stephan Ivanoff (assistant).

Kotzebue Sound.—Rock (Eskimo).

PRESBYTERIAN MISSIONS.

The Rev. George F. McAfee, superintendent of school work, Presbyterian Board of Home Missions, has kindly prepared the following sketch of the board's work in Alaska:

Fort Wrangell.—Missionary work was undertaken in Alaska in 1877. Rev. Sheldon Jackson that year visited Alaska and opened a mission school at Fort Wrangell, with Mrs. A. R. McFarland as teacher. Land was secured, buildings were erected, and in addition to the day-school work a limited number of girls were received into the teacher's home and taught domestic industries. This feature was suspended in 1895. Rev. Clarence Thwing, M. D., is in charge of the station. The native church has a communicant roll of 85 and a Sabbath-school membership of 100. A church composed of white settlers was organized in March, 1898, with 23 members.

Chilkat Mission (Haines).—The mission to the Chilkats at Haines was established in 1881, Rev. Eugene S. Willard and wife being the first missionaries. Under their efficient management the work soon became very encouraging. Rev.

Digitized by Google

W. W. Warne and wife now have charge of the mission. The Government school is taught in the mission building. An efficient matron has charge of the home, and 16 boys and girls are there taught the industries. The church membership numbers 23, and the Sabbath-school scholars number 75.

Hoonah Mission.—The mission to the Hoonahs was undertaken in 1881, Rev. and Mrs. J. W. McFarland being in charge. A day school was maintained for a number of years, until the Government assumed control. Upon the death of Mr. McFarland, the widow continued the work until Rev. Alvin C. Austin arrived. The church shows 56 communicants and a Sabbath-school membership of 59.

Jackson.—The Hydah Mission was established in 1881. Rev. J. Loomis Gould was the missionary in charge for fifteen years. A boarding home was maintained for a number of years, both boys and girls being received. This department of the work was closed in 1897 and the pupils sent to the Sitka Training School, where they could have better advantages and be educated at less cost to the board. Miss Christina Baker, the matron, was continued as Government day-school teacher, and Rev. M. D. McClelland relieved Mr. Gould as missionary.

Juneau.—Rev. Eugene S. Willard and wife removed from Haines to Juneau in 1886 and opened a mission. Rev. L. F. Jones is now in charge. The church reports 78 communicants and 62 members in the Sabbath school. During the five years of Mr. Jones's incumbency he has received into the church 72 adult members on confession, baptized 61 children, and celebrated 36 Christian marriages. The work in the boarding home has been very successful, there being 32 boys and girls receiving instruction in various industries.

The white church numbers 31 members, and is under the care of Rev. James H. Condit. The people are moving in the direction of building a new house of worship to take the place of the former "Log Cabin Church," in which they now worship, and a manse will follow.

Point Barrow.—The board opened a mission to the Eskimos at Point Barrow in 1890. Prof. L. M. Stevenson was the first missionary. He was followed in 1897 by Rev. H. R. Marsh, M. D., and wife. The people received the missionaries' instruction readily. The home of Dr. and Mrs. Marsh is the first Christian home ever seen by the natives, and they are quick to imitate the missionaries in all Christian ways. A church organization is soon to be effected and a house of worship built. This is noted as the most northerly mission in the world, being within the Arctic Circle.

Saxman.—The latest mission to be established is Saxman. It is in charge of Rev. Edward Marsden, a native, the first to receive a thorough college and theological course and be fully ordained to Gospel ministry. The work is very promising.

St. Lawrence Island.—Mr. and Mrs. V. C. Gambell were sent to St. Lawrence Island in 1894. They were joyfully received by the natives. Their work for three years accomplished much good, but on account of Mrs. Gambell's health it became necessary for them to return to the States in 1897. Mrs. Gambell's health having been restored, they decided to return to St. Lawrence Island, leaving Seattle May 19 on the sailing vessel *Jane Grey*. Off Cape Flattery a gale was encountered, and at 2 o'clock of the morning of the 22d the alarm was given that the vessel had sprung a leak and was sinking. In ten minutes after the alarm was given the *Jane Grey* sank, taking with her Mr. and Mrs. Gambell and 30 other passengers. This is a sad blow to the work on St. Lawrence Island.

Sitka.—By far the largest, best equipped, and most successful mission conducted by the board in Alaska is the Sitka Mission. It was established in 1880. Boys and girls flocked into the building temporarily provided for the school until it was crowded to suffocation. The school is a training and industrial school for both sexes. From 100 to 200 pupils have been taught there annually since its organization. The boys are instructed in carpentry, blacksmithing, boat-building, shoe-

Digitized by Google

making, and gardening, and show great proficiency as practical workers in these trades. The girls are taught cooking, sewing, laundry work, and how to care for their rooms. So successful are they in acquiring a knowledge of these domestic industries that they are sought after by white families as house servants. The boys and girls come to Sitka Training School from almost the entire region of southeastern Alaska, something like 15 tribes being represented in the school. In order to show how practical is the work and how efficient are the workers, it may be stated that the shoe shop is under the direct supervision of a native who learned all he knows about the trade in the school, and with his helpers, all of whom are pupils, he makes all the shoes worn by the 153 pupils, besides doing a considerable amount of work for outside parties, which provides a small income to the school.

Out of the school work grew the church. Under the wise and faithful administration of Rev. A. E. Austin, so long pastor (and at intervals superintendent of the school), the church reached an enrollment this year of 384 communicants.

A white church numbering 10 members is also ministered to by the pastor of the native church.

Sitka Hospital.—Connected with the mission is a hospital, which is under the direction of Dr. B. K. Wilbur. Dr. Wilbur treated last year 107 in-patients and 119 out-patients, and performed 53 operations. Total of prescriptions made during the year, 3,435. This is one of the most important factors in the work at Sitka.

The enrollment in the Sitka school for 1897–98 was 153, about equally divided between boys and girls.

MISSIONS OF THE PROTESTANT EPISCOPAL CHURCH IN ALASKA.

The Rev. Joshua Kimber, D. D., associate secretary of the Domestic and Foreign Missionary Society of the Protestant Episcopal Church, sends the following statement:

In the Territory of Alaska this church has established missions among the whites at Sitka, Juneau, Douglas, Copper River Country, Numook, Skagway, and Circle City; and among the Indians at Anvik, Circle City, Fort Adams, Ketchikan, Numook; and among the Eskimo of Arctic Alaska at Point Hope.

The whole work is under the supervision of the Right Rev. P. T. Rowe, D. D., assisted by the Rev. Messrs. Campbell, Chapman, Gurr, Prevost, and Wooden; Drs. Driggs and Watt, missionary physicians; and the following ladies: Mrs. Chapman, Mrs. Prevost, Mrs. Selden, Mrs. Watt, and Misses Deane and Sabine, and Miss Proebstel, Miss Edmonds, and Miss Heywood, trained nurses.

In the last report from Bishop Rowe he states that many changes have occurred in the population of Douglas Island, owing to the great attraction of the Yukon. There are, however, nearly 1,000 men employed in the mines, and a splendid opportunity for missionary work presents itself at that place. At Ketchikan the Rev. A. J. Campbell, M. D., established a new station. Four acres of ground were given on condition that a mission and school should be built. The doctor purchased a cabin for $200, and improved it at an expenditure of $175 more, thus providing a commodious, neat, and suitable building for school and church purposes. In January last this missionary baptized 27 Indians, and presented 9 for confirmation by the bishop. In the school there have been gathered 47 children, Thlinkets and Hydahs, who have made wonderful progress in their studies. A few months ago they were heathens, not knowing a word of English; to-day they can sing several hymns, recite the Lord's prayer and creed, and read fairly well. Miss Edmonds is in charge of this school.

At Skagway the bishop, with the assistance of Dr. Campbell, opened a mission some twelve months ago and founded a hospital with the aid furnished by the settlers and others. The building, a log one, contains two rooms—a kitchen below

Digitized by Google

and a ward above—and cost about $2,000. The capacity of the building was soon overtaxed with patients, and an addition had to be built. Bishop Rowe, in his report, stated that for some time he visited the hospital daily, and it was pitiful to see strong men, far from home and dear ones, sick and dying. "As I bent over one man," the bishop wrote, "who died shortly after I lifted his head, he took my cross in his hands, kissed it, and sank back with a look of resignation and peace glowing upon his face."

Dyea, a place of 4,000 people, was visited by Bishop Rowe, and some services held. Leaving that place April 26, 1898, the bishop, accompanied by Mr. Selden, started on the trail to the interior, passing, en route, Sheep Camp, Chilkoot Pass, Lake Lindeman, Lake Bennett, and Rink Rapids, reaching Dawson Saturday afternoon, May 30. Here the bishop, after resting five days, held two services and preached.

At Point Hope Dr. Driggs, missionary physician, is carrying on successful work. The mission services are well attended. There are over 60 children under instruction in the Sunday school.

At Anvik, 600 miles from the mouth of the Yukon, the Rev. Mr. Chapman, with his devoted wife and Miss Sabine and Miss Proebstel, are maintaining, with commendable diligence and fidelity, the arduous duties of that mission. The mission buildings at Anvik consist of a church valued at $1,250, a dwelling house valued at $900, and a schoolhouse valued at $700. In addition to these buildings the mission also owns a schoolhouse occupied by 6 girls of the boarding school, under Miss Sabine; a sawmill worth about $2,000; a storehouse worth $200; a laundry valued at $300, and two small cabins. Mr. Chapman reports that the new schoolroom was opened November 22, and that during the whole winter it was used for daily service as well as for the school. On November 29 the foundation of the new chapel at St. Paul, on the Chageluk Slough, was laid and the walls put up as high as the eaves. The work was done by the volunteered labor of the people of the village and its vicinity. The total attendance at school for the year ending May, 1898, was 4,531, an average of about 24.

At Circle City services and religious instruction among the whites and Indians have been maintained throughout the winter. A very good house and lot adjoining the mission have been purchased and a hospital has been built, the cost of the land being $900, which was paid by the miners. Mrs. Prevost and Miss Deane have earned the good will and hearty praises of all by their services rendered to the sick during the winter. The Rev. Mr. Prevost has charge of the station and Dr. Watt is the medical missionary.

MORAVIAN MISSIONS.

Bethel.—Owing to the scarcity of food in the vicinity of Bethel, the school was closed early in the winter. However, a normal class, consisting of the most promising of the natives, was continued throughout the year.

This station has sustained a great loss in the death of Mr. and Mrs. Weber, who were drowned in the Kuskokwim while returning to Bethel after a winter in the States. In order to reach their post as quickly as possible, and at the same time save expense, Mr. and Mrs. Weber accepted the proposition of a party of prospectors to give them free transportation up the Kuskokwim in return for Mr. Weber's services as interpreter and as pilot. At Good News Bay, south of the mouth of the Kuskokwim, the party transferred from the steamship *Lakme* to the little stern-wheel river steamer. Their supplies were stored in two barges, which were towed astern. While the transfer from the larger ship was being made, Mr. Weber made a hurried trip to the mouth of the river, where he met several of the missionaries, who were waiting for the arrival of their supplies. He handed them their mail, and spent twelve hours in their company, returning to the river steamer on June 26. The start was made on June 27. Soon after their departure

Digitized by Google

the wind increased in violence, blowing a gale from the southeast, making a nasty sea at the mouth of the river. The wreck of the barge containing the supplies was discovered by the natives a few days later. Of the steamer and her passengers not a trace has since been seen.

Carmel.—School was in session for a term of one hundred and seventy-five days, the attendance averaging 28 per day. Several white families have settled in the vicinity of the station in order that their children may attend the school. Carmel was visited by several travelers during the winter; among them were Mr. G. F. Tilton, third officer of the whaler *Belvedere*, wrecked at Point Barrow, and his guide, Mr. Koltchoff, en route to the south. They stayed five days at Carmel and attended the wedding of Mr. and Mrs. Rock.

BAPTIST MISSIONS.

The Rev. C. P. Coe, superintendent of the Orphanage on Wood Island, supported by the Woman's American Baptist Home Mission Society, sends the following report:

Six years ago the Woman's American Baptist Home Mission Society, which has its headquarters at 510 Tremont Temple, Boston, established the only Baptist mission that is now supported in Alaska designed to reach the needs of the natives of that district. The site chosen was Wood Island, a small wooded dot of land in the Pacific, 4 miles long by 2 miles wide. Wood Island is but 2 miles from Kadiak, the largest island in that part of the country. It is located about the middle of the portion of Alaska assigned to the Baptist denomination, which begins at Mount St. Elias, and extends for 1,000 miles or more to the west, ending at the Shumagin Islands.

The workers at present are Rev. Curtis P. Coe, superintendent, and wife; Mr. and Mrs. G. A. Hill, and Miss Hattie Denniston. There are at present 26 children in the home, and at least 50 have received care, attention, and training for a shorter or a longer time since the beginning of the work. These children are collected from extremes of about 1,400 miles, 5 being from Kayak Island and 2 being natives of the Seal Islands.

The children are docile and tractable, and most of them have confessed privately their faith in Jesus, but they have been as timid as other children in making a public confession and asking for baptism. That a large proportion of them are really Christians can not be doubted by those who come in contact with them daily.

Several improvements have been made since the last report that have lessened the labor and added value to the plant. Waterworks were devised so that now there is hot and cold water in the kitchen and cold water in other parts of the house. The water comes from a well on top of a hill and is siphoned to the second story of the mission. A large wood furnace has been constructed which warms several of the rooms; hundreds of rods of fence have been built, and a silo that will hold 50 tons of ensilage, with which to feed our three cows, two calves, and a horse, has been constructed. In all the building, as well as in the ordinary work, the boys have had a large part and have shown their usefulness. The girls have been very helpful in all kinds of housework.

Last spring the Government established a school on the island, which was a cause of rejoicing, and very recently comes the report that we are to have a monthly mail throughout the year instead of being deprived of mail service for five months.

At this location is the only Baptist church and chapel in Alaska, and the only building west of Sitka erected especially as a house of worship by any other denomination than the Greek Catholic.

Mr. and Mrs. Coe left the field in October for the winter for a needed rest. In the month of January the former visited New England and presented to those who have been in the past supporting the work there a detailed account of the

Digitized by Google

past, the present, and the prospects for the future. Much enthusiasm was manifested by the people and almost all of the special needs that were presented were supplied, and an increased interest was awakened in the minds of the people from whom the support must come.

The Woman's Society is asking from its constituency $5,000 annually for the continuance of the work of this the only Baptist work in Baptist ground in Alaska.

THE SWEDISH MISSION COVENANT'S MISSIONS.

The Rev. D. Nyvall sends the following account of affairs at Unalaklik, Golovin Bay, Yakutat, and Kotzebue Sound:

Unalaklik.—At Unalaklik last autumn and winter la grip prevailed. Miss Alice Omekitjook mentions in her letter that 14 died at Unalaklik during October.

During Christmas week the missionaries had the pleasure of entertaining Lieutenant Jarvis and his men. They brought letters from the United States, the first winter mail our missionaries ever received in Alaska. At Unalaklik Mr. Jarvis was met by the reindeer sent him from Port Clarence.

The latest report from Unalaklik is a letter from Karlson, of September 29, 1898, telling that the school at Unalaklik for the winter had commenced with a good attendance. Mr. Ivanoff, from Kangekosook, has been transferred to Unalaklik to teach the school at the last-mentioned place, and Kangekosook at present left.

All our workers at Unalaklik are in great need of rest.

Golovin Bay.—Last winter (1897-98) was hard on the natives, not only through sickness but lack of food. Mr. P. H. Anderson, of Golovin Bay, tells us that he often saw natives chew their skin boats and their shoes in want of food. Most of the school children were more or less supported at the station.

In April Mr. Anderson made a journey with dogs from Golovin Bay to Unalaklik, 125 miles. It took four days, and was a grim adventure in every respect. The home journey was made by reindeer, and proved to be, in comparison, very delightful and pleasant. A greater part of July Mr. Anderson was obliged to spend in St. Michael waiting for the mail, as he expected news regarding his betrothed and her coming.

At a great bargain Mr. Hultberg and Mr. Anderson came in possession of a lot of lumber and other building materials, with which Mr. Anderson has erected a new school building, so much needed. It is 24 feet by 16 feet and 10 feet high. In his latest report Mr. Anderson hoped to get the building ready October 17, so that the school could then commence. We are under obligation to Dr. Jackson for a stove which he bought in St. Michael and presented to the school at Golovin Bay.

Yakutat.—Our missionaries at present at Yakutat are Mr. Albin Johnson and his wife, and Mr. K. Hendrikson, who last summer tried hard to find a shorter and better route over the icebergs to the interior, but after heroic efforts he was obliged to return defeated.

The last reports from Yakutat were letters from Albin Johnson and from K. Hendrikson, dated October 21 and 29, respectively. In his letter Mr. Johnson tells of the baptism of a native woman, and adds that several others were awaiting baptism. We are also told that the natives last summer were unusually successful in their fishing, and consequently were looking forward to the coming cold season with minds free from care. Like reports come also from northern Alaska.

A new building was erected at the station last spring, prior to Mr. Hendrikson's journey inland. The lumber used for that purpose was sawed by the missionaries themselves at our sawmill. In regard to the right of occupancy and use, for the mission, of the land around the station, the missionaries recommend that the said land be surveyed and mapped out by proper officers. The land is recorded in the land office at Sitka in the name of the Swedish mission.

Digitized by Google

Miss Selma Peterson, one of our missionaries of Yakutat, is at present in Chicago, where she has, through the courtesy of the board of directors of the Augustana Hospital, been taking a practical course of training as a nurse at the said hospital free of charge. At present she is at our college preparing herself for examination as a teacher, her intention being to return to Yakutat early next summer and take up the school work at that place.

FRIENDS' MISSION.

Kotzebue Sound.—The following paragraphs are taken from the report of Mr. Robert Samms, one of the missionaries at Kotzebue, which was kindly forwarded by Mr. I. H. Cammack, of the California Yearly Meeting of Friends, which supports the mission in Kotzebue Sound:

After finding it impossible to ascend the river, it was necessary to make a hasty preparation for the winter; this was begun on faith coupled with works. Some boards were on hand, and tools, the ground frozen from 2 feet below the surface to unknown depths, and not enough wood in sight to cook a meal's victuals. The natives were given to understand we would trade for all the logs they would bring; so men, women, and children were soon busy catching driftwood, which was being borne down by the inland freshets. Trading for wood and fish took a good deal of time, as each stick of wood had to be traded for separately, and the fish had to be cleaned. We used our own boat in gathering wood until we could no longer force our way through the mushy ice; we gathered the wood for about 4 miles from our house. We were thus occupied until the ever-increasing cold and shortening days made out-of-door work impossible. The water supply for the mission has made considerable work. For about seven months of the year all the water is procured by melting ice. This has been hauled on sleds from about one-half mile distance, being first dug from under 3 feet of snow and blocked out with an ax.

To keep reasonably free from vermin and disease has required a good deal of washing and bathing. The drifting snow has given us considerable trouble by stopping door and windows, also covering our wood to a depth of 10 feet. Cutting wood for two stoves has been no small task, considering the wood we have to use. The white men that have been here during the winter required some attention, as they were generally worn out and supplies exhausted by the time they reached our mission. Two of the Government relief expeditions to the whalers at Point Barrow reached our house about midnight, and almost fell into the door, exhausted by exposure and hunger. To all these we rendered every assistance in our power. We have made four trips with sled and dogs for wood, going about 10 miles across the sound.

I think the poverty of the natives will always be a source of trouble to the missionaries. So far as we can see at present, the only hope of improving the temporal condition of the Eskimo is in the success of the reindeer project as promulgated by Dr. Jackson. There have been two births and six deaths for the eight months past. At this rate the Eskimo will soon belong to the past. Physically, the Eskimo is well appearing, of the Mongolian cast, about 5 to 5 feet 10 inches in height, with small hands and feet, broad face and high forehead. Doubtless this has been a hardy race, but, like the Indian, the demoralizing influences of bad white people have made them wrecks, both physically and morally. The older generation do not show this deterioration so much as the younger class, whose blood seems to be inoculated with the worst of blood diseases. Intellectually, they are quite promising. They learn rapidly, especially such knowledge as they can turn to some practical account; have considerable liking and talent for music, and are naturally cheerful. Their mode of living prevents their attending school regularly, but seems to add intensity to their efforts in improving what opportunities they have.

Digitized by Google

If the Eskimo has any standard of morals, it is only of the lowest character. Religion he has none, but he is superstitious about everything, and takes without question any absurdities the shamans may choose to make up. The chief business of the shamans is to see that all the superstitions are properly observed, also to appease any evil-disposed spirit that is troubling his people, and last, but not least, to charge well for his services. The Eskimo seems to have no conscience; no such word is found in his vocabulary. He steals, lies, cheats, and murders apparently without a shadow of remorse. His idea of a good man is one who is a successful hunter.

In manner of life, the Eskimo is seminomadic. He has a village where is located his burying ground and winter house. Here he spends the short cold days of winter, repairing his implements and planning for his food campaign. The women find plenty to do dressing skins and making clothing, trade goods, etc. As the days lengthen he carries on more or less hunting until signs of returning summer appear. He then abandons his winter home and goes to the fishing place or trading post.

The main dependence for food at this place is the salmon. All the other fish and the seal taken, though helping out a good deal, would not be sufficient to make up for the loss of the salmon if they should fail to come. Hence the importance of the deer being introduced as soon as possible. The people are generally insufficiently clothed; this the reindeer would remedy.

CONGREGATIONAL MISSIONS IN ALASKA.

[Report for United States Bureau of Education, by Rev. C. J. Ryder, D. D., corresponding secretary of the American Missionary Association for the Congregational churches.]

This mission at Cape Prince of Wales is in western Alaska. The work extends inland from Bering Strait, covering the whole of the peninsula upon which Cape Prince of Wales is the most western point. The American Missionary Association has maintained missionary work since 1890 in this portion of Alaska, which was assigned to the Congregational care in the division of the Alaskan territory among the Christian denominations. Carefully observing the conditions of interdenominational comity and good fellowship, the work has not been pushed beyond the limits of the territory originally agreed upon in conference of the various societies when entering the Alaskan field. The point held by our Congregational mission is a very strategic one. The Eskimo who touch at this point and come in contact with the Christian influence of the mission are scattered widely along the coast, and so carry the impressions of the work to many hundred people out of the reach of any other mission work. So from the interior many Eskimo come to Cape Prince of Wales when hunting and fishing, as this is a natural point of sailing. This gives the missionaries of the American Missionary Association, W. T. Lopp and his faithful wife, large opportunity for reaching those not immediately in the territory of their mission field. Many of the young Eskimo have been reached, and the report of their growth in Christian manhood and womanhood is very encouraging. There was some opposition on the part of the parents and "Un-ut-koots," or magic doctors, but this has been gradually overcome. By the kindly and charitable treatment of these experienced missionaries their work is better understood and gaining a larger influence each year. The practice of medicine in the administration of a few simple remedies during the summer and fall relieved a good many sufferers and wonderfully increased the influence and power of the missionaries. The winter has been a hard one along the coast. The season, with abundant wind and ice, has been very unfavorable for hunting. Mrs. Lopp relieved some of the settlements north of Cape Prince of Wales as long as her supply of flour lasted, which she exchanged for driftwood, which the Eskimo haul down in dog sleds. The living for these poor people was very limited, being confined to an occasional grouse or a few frost fish. Only two small whales were

Digitized by Google

killed during the winter. The walruses furnished considerable food, and the walrus skins were of value. The Eskimo gathered at Cape Prince of Wales are careful observers of the Lord's Day and do not hunt during its hours. Notwithstanding this they have been unusually successful, having killed eight large walruses.

Mr. Lopp has just completed a large cold-storage cellar, or pit, under the storehouse to preserve meat during the summer. He writes: "We are trying to induce the natives to make better cold-storage cellars, so that they will not be compelled to eat half-decayed meat during the summer and fall, and even in the following winter should seals at any time be scarce. It would be extremely nauseating to a 'tenderfoot' to witness natives eating putrid meat."

The Fourth of July was celebrated with enthusiasm at Cape Prince of Wales, under the care of the missionaries. The Eskimo greatly enjoyed it. The weather was splendid, and certainly the lesson of Christian patriotism impresssd upon the natives of this far-away territory must prove useful. The general comment of those who have seen the people at Cape Prince of Wales is that they are of the very best class of natives. The work of the mission school is very marked. The result already obtained is very hopeful.

The little paper published there, called The Eskimo Bulletin, has attracted general attention. A copy will soon appear in the Strand Magazine, of London, as one of the remarkable newspapers of the world.

The great event in the history of the mission at Cape Prince of Wales since it was last reported was the remarkable effort of Mr. Lopp to relieve the whalers who were imprisoned by the ice off Point Barrow. The heroism of the undertaking on the part of Mr. Lopp and his noble wife, who remained at the mission almost alone during his absence, can not be overstated. Lieutenant Berry, who reported the trip of Mr. Lopp, closes in the following words: "Mr. Lopp reached Point Barrow on March 30 with 400 reindeer, which he had driven over the icy wastes as fast as the others could do alone in the dog sleds. His journey shows he had the deer on the run most of the time. Shortly after picking up Lieutenant Bertholf, 34 deer stampeded and were lost, but when the three herders were sent back they found them, and took them all into Point Hope. Mr. Lopp left Point Barrow on his return trip on April 5, and got home to Cape Prince of Wales in thirty-one days, only twenty of which were traveling days, for he met some weather in which he could not travel, and he would not travel on Sunday when he was proceeding on his own account. The lowest temperature that he experienced was 43 degrees below zero; but he told me that was not half so cold as one day when the thermometer was at 40 degrees below zero and it was blowing a blizzard."

From Mr. Lopp's own report to the American Missionary Association we gather the following:

"After a sleepless night Mrs. Lopp and I decided that it was necessary to carry this relief to the whalers and that I must myself go. You can imagine at what cost this decision was made. Separation of family from three to six months, loss of deer, breaking our plans for this year and next; but it was an errand of mercy, and we were glad to have opportunity to show these people that our Government cared for her people and would go to great expense to save a few in distress.

Mrs. Lopp's work.—Mrs. Lopp preferred to remain instead of going to Port Clarence, as was planned at Washington. Netaxite, the herder, and his wife and child lived in the herder's house, near ours, and assisted her in every way possible. She taught a class of more advanced pupils daily and Netaxite taught the primary school, doing fairly well. Our two girls of last year and Sokweena's wife were with Mrs. Lopp. So you see she had a more difficult position, remaining here alone, than those of us who were in the expedition. It was a great trial of our faith, but we have to trust for so many things up here that it seemed

Digitized by Google

natural. While out on the trip we knew we should be remembered by the weekly prayer meeting of our Eskimo Christians here, and I think they feel that their prayers were not unheard.

In the wilderness.—The weather favored us wonderfully. Lieut. D. H. Jarvis, who planned and commanded the expedition, was an ideal, unselfish commander in every respect. The managing of the deer he intrusted to us. It was a new experience for our five herders and two from adjoining settlements and a very doubtful undertaking to attempt to drive 436 deer a distance of 700 miles to reach Point Barrow. All the old Eskimo said we would never reach Point Barrow. Two days after leaving Kotzebue Sound a howling blizzard scattered our deer. We found all but 34 after the storm had subsided and moved on. These 34 were found by the natives and driven in and delivered to us afterwards.

The practical value of a Christian mission at Cape Prince of Wales and the sensible method of conducting such a mission have been abundantly illustrated in this expedition of Mr. Lopp.

Missionary visits.—Mr. Lopp has carried on missionary visits among other stations and reached the Eskimo in their settlements. He has learned the language of the people and speaks somewhat fluently to the Eskimo in their own tongue. Just south of Point Hope service has been held at a whaling station, where several families gathered from up and down the coast to receive the message of good news.

It was certainly a reasonable act of the United States Congress in voting an appropriation to Mr. Lopp and those who went with him in this heroic and hazardous journey for the rescue of these ice-bound whalers. The value of the mission at Cape Prince of Wales has received practical demonstrations in every way possible during this year.

I have the honor to be, sir, very respectfully, your obedient servant,

SHELDON JACKSON.

Hon. W. T. HARRIS, LL. D.,
Commissioner of Education.

CHAPTER XLI.

EIGHTH ANNUAL REPORT OF THE INTRODUCTION OF DOMESTIC REINDEER INTO ALASKA.

DEPARTMENT OF THE INTERIOR,
BUREAU OF EDUCATION, ALASKA DIVISION,
Washington, D. C., December 31, 1898.

SIR: I have the honor to submit to you my eighth annual report on "The introduction of domestic reindeer into Alaska."

The year just closed has been one of more than usual interest. It opened with the Government relief expedition, in charge of Lieut. D. H. Jarvis, of the United States Revenue-Cutter Service, to the whalers in the neighborhood of Point Barrow, Alaska, and with a Government commission to Lapland, Norway, for the procuring of a colony of Laplanders and the purchase of a herd of reindeer trained to harness, to be used in transporting relief to the destitute people in the mining regions of Alaska; also, the establishment of a new reindeer station in the neighborhood of Unalaklik, 60 miles north of St. Michael. It being necessary to send Mr. William A. Kjellmann, the superintendent of the reindeer stations in Alaska, to Norway in charge of four families of Lapps, whose term of service had expired and who according to contract were to be returned to Lapland, Dr. A. N. Kittilsen, the physician and assistant superintendent, was placed in charge of the herd at the Teller Reindeer Station, with Mr. T. L. Brevig as his assistant. Mr. Frederik Larsen (Lapp) was kept with the herd as overseer, and Messrs. John Tornensis and Mikkel Nakkila (Lapps) were kept at the station during the fall of 1897, repairing and making sleds and harness, preparatory to the removal of a portion of the herd to the new station near Unalaklik.

On the last of October Dr. Kittilsen made a trip to Cape Nome, where he received from Antisarlook 53 male, 65 female, and 3 fawn reindeer for the Government, which had previously been loaned and were now being returned. He also secured 4 females and 3 fawns belonging to Tatpan, of Golovin Bay.

In the middle of November a trip was made to Cape Prince of Wales, returning November 28 with 3 head of deer belonging to the Government.

As Tautook, Sekeoglook, and Wocksock (Eskimo) had served their apprenticeship of five years, it was proposed to establish them at the Teller Station with a herd of their own when the Government herd should be taken to the new Eaton Station. Accordingly on December 3 each of the three received, according to contract, 20 females, 3 males, and 2 sled deer. These, together with those previously owned by them and since born in their herds, gave Tautook 77 head, Sekeoglook 59, and Wocksock 50, making a herd of 186 between them. The apprentice Ojello, being quite sick, was left with his family at the Teller Station.

On December 19, leaving Mr. Brevig in charge of the Teller Station, Dr. Kittilsen, in charge of the Lapps and apprentices other than those mentioned as having been left at the Teller Station, started across the country for Unalaklik with 450 reindeer and 40 sleds, arriving at Golovin Bay on the 29th of December. There were 17 in the party, counting women and children. The 7 deer brought from Cape Nome for Tatpan, an apprentice above mentioned, were transferred to the herd at Golovin Bay, and 17 deer belonging to Martin, an apprentice at Unalaklik, were lassoed and taken into the Government herd to be driven to the Eaton Station.

On January 3 the journey was resumed, but two days later a snowstorm of unusual severity was encountered, and the party went into camp, the deer being returned to the neighborhood of Golovin Bay, where the pasturage was more accessible. While in camp, January 10, Lieutenant Jarvis and Dr. Call, of the relief party for the whalers, arrived from the south and asked for reindeer transportation to Port Clarence. Accordingly, on January 12, Dr. Kittilsen, taking two

Digitized by Google

of the apprentices, drove back with Lieutenant Jarvis and Dr. Call to the Teller Reindeer Station, where they arrived on the 19th. Leaving Lieutenant Jarvis to push on to Cape Prince of Wales and Dr. Call to Cape Nome, Dr. Kittilsen, with the apprentices, on January 26, started on their return to Golovin Bay, reaching there February 9. During Dr. Kittilsen's absence Lieutenant Bertholf, also of the Point Barrow relief expedition, had arrived at the reindeer camp near Golovin Bay and induced Frederik Larsen to take five deer and sleds to help him across Kotzebue Sound with provisions for the relief party, claiming that it was impossible to get the goods across the country with dog teams. After arriving at Kotzebue Sound, Lieutenant Bertholf retained the reindeer teams for his further trip to Point Hope, returning Frederik Larsen to Golovin Bay.

On the 13th of March camp was broken and a start made for Unalaklik, which place was reached on the 21st. The spring was utilized in cutting and hauling several hundred logs for the erection of houses at the new station, located near Unalaklik and named "Eaton," in honor of Gen. John Eaton, ex-Commissioner of Education. After the logs had been hauled to their destination, the herd was moved to the foot of the mountains southeast of Unalaklik, where a good fawning place was found.

In April an expedition was made to Golovin Bay to return some provisions which had been borrowed from the Swedish Mission Station during the detention of the herd in that neighborhood the previous winter.

PERSONNEL.

Mr. William A. Kjellmann was continued as superintendent of the stations in Alaska, but being detailed for special duty in returning Lapps to their native country and in procuring a new colony, he was absent from the field until July. Returning from Norway and reaching Eaton Station, he immediately utilized the temporary presence of the large colony of Lapps by dividing them into three parties, one to have charge of the herd, a second party to freight the supplies from the landing place on the coast to the station, and the third party to erect the necessary buildings. This enabled him to make rapid progress in getting the new station in order for winter. When the station was last heard from, arrangements were in progress, by which it was expected that a large number of the Lapps would be distributed along the Yukon River for the purpose of carrying the United States mail, and the smaller number kept in the service of the reindeer stations. During the absence of Mr. Kjellmann, Dr. A. N. Kittilsen was in charge at the Teller Station until December, when he went with the herd and took charge of the new station on the Unalaklik River until the arrival of Mr. Kjellmann. On the arrival of Mr. Kjellmann, Dr. Kittilsen resigned and left for the mines, his place as physician being taken by F. H. Gambell, M. D., of Iowa. Upon the departure of Dr. Kittilsen from the Teller Station, Rev. T. L. Brevig was placed in charge.

With the increase of stations and enlargement of the work, Mr. Hedley E. Redmeyer was also made an assistant superintendent.

Herders.—Messrs. Tornensis, Nakkila, and Larsen, the Lapps that remained in Alaska, continue in the service of the Government. During the trip of myself and Mr. Kjellmann to Norway we secured 113 Lapp, Norwegian, and Finn men, women, and children, who were removed to the Eaton Station, from which they are to be distributed to various localities where most needed.

At the closing of this report it has not been determined how many of them will remain in the service of this Bureau and how many will go into the postal service of the country.

Apprentices.—During the year three of the apprentices, namely, Tautook, Sekeoglook, and Wocksock, of the Teller Reindeer Station, have gone into business for themselves, having served as apprentices for five years (the full term), locating their herd in the neighborhood of the Teller Station. Electoona and Ahlook, from Point Hope, and Ojello, from Point Barrow, with their families, were sent to Points Hope and Barrow to take charge of the herd driven up for the relief of the whalers, or of such portion as was not slaughtered for that purpose. To assist the Eskimo apprentices, Jacob Larsen Hatta, wife, and two children, and Mr. Lars Larsen Hatta (Lapps) were also sent.

This herd was to be divided into two equal portions, one of which was to be loaned to the Presbyterian Mission at Point Barrow, and the other to the Episcopal Mission at Point Hope. Ten of the former Eskimo apprentices have now herds of their own, and are careful and diligent in increasing them. Their herds aggregate nearly 500 head.

BUILDINGS.

The Rev. T. L. Brevig, who arrived at the Teller Reindeer Station in 1894 as teacher, needing a year's vacation, returned to the States last fall. The care of the public buildings thus vacated was given to Dr. Brandon, who in return for the same agreed to care for the buildings and also counsel with the Eskimo herders in the neighborhood.

At Eaton Station substantial log buildings were erected for the superintendent, physician, and herders' families; also for the necessary storehouses.

THE HERD.

The Government herd was driven during the winter from the Teller to the Eaton Station, a distance of about 300 miles.

The 120 reindeer that had been loaned by the Government to Antisarlook in January, 1895, were returned by him last winter, he retaining 160, the same being the increase during the three years that the herd had been in his possession. Seventy-five deer were given by the Government to Tautook, Sekeoglook, and Wocksock, who had finished their term of apprenticeship, and in accordance with the terms of their contract, to enable them to commence an independent herd. One hundred and sixty deer belonging to Antisarlook's herd at Cape Nome and 301 deer belonging to the missionary and Eskimo herd at Cape Prince of Wales were borrowed by the Government, making a total of 461 reindeer for the relief of the ice-imprisoned whalers at Point Barrow. Of these, 180 males were slaughtered for food, the females being kept as a nucleus of a permanent herd at Point Barrow.

At Golovin Bay the union herd, belonging jointly to the Swedish Evangelical Union Mission and Episcopalians, was increased during the year by 99 fawns born. It is expected this winter that the herd will be divided, and the portion belonging to the Episcopalians will be driven across the country to Weare, at the mouth of the Tanana River.

Instructions were left at the Eaton Station to loan 100 head of reindeer to the Roman Catholic Missions on the Yukon River, and send with the herd an experienced Lapp to take the oversight of the herd and instruct the native apprentices in its care and management.

PURCHASING STATION IN SIBERIA.

From the commencement of the introduction of reindeer into Alaska in 1892, it has been my constant study to devise some method for procuring larger numbers of reindeer during the season. During the experimental trip of 1891, two months were spent on the revenue cutter *Bear* in procuring 16 head. The following year 167 were secured, being the largest number purchased within any one year in Siberia. During 1893, 1894, and 1895 the very best that we were able to accomplish in a season was the purchase of from 120 to 125 head. In 1896 a partial agreement was effected with a private party to procure and bring over from Siberia to Alaska reindeer at a fixed price per head, which resulted in a total failure, not one being secured. In 1897, in continuation of the policy of trying different methods for procuring the reindeer, Mr. John W. Kelly, Mr. Conrad Siem, and Mr. A. St. Leger were sent to Siberia to remain during the winter. A small, cheap frame house was erected, and they were furnished with necessary barter goods required for the purchase of reindeer. During the fall their success was such as to encourage the hope that a practicable method had been found of procuring the reindeer in large numbers, several hundred of the deer being purchased and either delivered or placed in herds where they could be reached the following summer during the few weeks that the ice allows the access of ships to the coast, when a vessel would be sent to transport them to Alaska. It appears, however, from the statements of the purchasing agents that during the winter jealousies and feuds broke out among the different native villages which precluded any further trading, and so endangered their lives that the following July they felt compelled to go on board a whaler and leave the station.

Upon my visit to the place early in August I was able to trace and secure but 100 head of the several hundred which had been bought. After the employees had abandoned the station the natives seemed to have appropriated whatever they could lay their hands on, including the deer in the herd. Under the circumstances it was not thought expedient to carry this experiment further, and the station was closed. It is probable that the next method will be to try and arrange with some Siberian firm of standing and character to purchase deer for the Government. Possibly Russians will succeed better in bartering with the natives for deer than Americans. The 161 head of reindeer which I brought from Siberia in August were turned over to Mr. W. T. Lopp, to replace in part those that the Government had borrowed for the Point Barrow relief expedition.

PRIVATE REINDEER ENTERPRISES.

The sudden influx of large numbers of miners into central Alaska, and the difficulty of procuring supplies and provisions at the mining camps, called public attention to the necessity of introducing the reindeer as a factor in freighting and transportation. During the years when the natives had occasion to travel from village to village, their journeys were comparatively short and time was no object, consequently it made no difference whether they were a week or a month on the road, and dog teams served a useful purpose. So during the days of the fur trade the few fur traders in the country, with their homes on the river supplied with provisions by an annual trip of a steamer, could manage to get along comfortably with dog transportation. But in the increased and more rapid development of the country the need of better transportation facilities was recognized. The experiments of the Government had already demonstrated the value of the reindeer, and three or four private enterprises were at once started, the details of which have been difficult to obtain. From newspaper reports I glean that a Mr. G. Lewis, of Montreal, acting in the interest of the Reindeer Transportation Company of Vancouver, shipped 42 reindeer from Norway on the steamship *Hecla*, reaching New York February 1, 1898. They were consigned to a Mr. J. G. Scroggs. Seven died on the trip across the ocean, and 29 in crossing the continent. But 6 lived to reach Skagway, and of those but 2 reached Dawson.

At Skagway I was informed that in November last Mr. David O'Neil, an Arizona miner, before going into the Yukon, visited Norway to procure a herd of reindeer for use at the mines. Not finding in eastern Lapland as large deer as he wanted, he continued up the coast to Tromsoe, then traveled into the interior across Norway and Sweden to Archangel, Russia, on the White Sea; from thence 480 miles northeast to Petchora Bay, Arctic Russia, where he is said to have found reindeer weighing from 500 to 600 pounds, trained both in hauling and packing. He purchased a herd of 2,000 head, costing about $12 apiece. With 34 selected deer he started for Hamburg, Germany, a journey of 1,800 miles across the country. Twenty-three days were consumed in crossing the Atlantic, during which time a number of them died; others died in crossing the continent, so that when Skagway was reached only 1 deer out of the 34 was left, and that one died before he could be gotten off the wharf.

The poor success in transporting the 34 deer so discouraged him that he telegraphed to Russia to sell the remainder of the 2,000 that he had purchased. It is to be regretted that these enterprises were not more successful, as the deer are so greatly needed in Alaska. The failure, however, was not due to any insuperable difficulties in the way of transporting them from Lapland, or to any inability of the reindeer to endure long voyages, as was proven when, a month later than Mr. O'Neil's expedition, the United States commission to Lapland transported 539 reindeer from Lapland, twenty-six days at sea and across the continent to Seattle, with the loss of but 1.

I have been informed that in the above private expeditions sufficient moss was not brought with the deer, but an attempt was made to accustom them to live on hay and grain while en route.

NO DOMESTIC REINDEER IN CANADA.

Last winter, while the Government and private parties were looking to Lapland for reindeer, a report was started, and found credence in some quarters, that it was unnecessary to go to Lapland, as the reindeer could be purchased better in Canada. Not having heard that there were any domestic reindeer in Canada, a letter was addressed to the Hon. George M. Dawson, LL. D., director of the geological survey of Canada, which elicited the following reply:

GEOLOGICAL SURVEY OF CANADA,
Ottawa, May 21, 1898.

MY DEAR SIR: I have your note of May 17, asking about supposed settlement of Lapps and domesticated reindeer in the vicinity of Hudson Bay. The report which has reached you is, however, quite erroneous, as nothing of the kind exists either there or on the Labrador coast, not even in connection with the Moravian missions of the last-named locality.

I am much obliged for the copy of your interesting report on the reindeer, duly received.

Yours, truly,

GEORGE M. DAWSON.

Rev. SHELDON JACKSON,
Alaskan Division, Bureau of Education,
Washington, D. C., U. S. A.

HOW REINDEER WILL SUPPLEMENT THE STEAMBOAT AND RAILROAD IN ALASKA.

The following quotation, which is a clear and concise statement of the value and extent of reindeer transportation, is from a circular prepared by Hon. W. T. Harris, Commissioner of Education. Dr. Harris writes:

Whatever may be the development of transportation by river or by railroad in Alaska, the reindeer will prove a useful auxiliary by rendering possible a ready distribution, even for long distances from the terminus. For instance, the steamers that visit the Upper Yukon unload their goods at the terminal points. From these terminal points in the winter the reindeer can convey provisions and other supplies to the miners 20, 40, or 100 miles or more, as the case may be. If a railroad should be made from Skagway, or from Prince William Sound, or any other point, into the interior, at its terminal point various reindeer expresses make possible the distribution of the freight from the railroad to distant points in various directions from the terminus. They would likewise collect freight for the terminus. Meanwhile the reindeer can not be used as a substitute for the river or the railroad in the carrying of freight, any more than horses or oxen can be used for that purpose, because, while the amount of freight carried by the reindeer in the winter time is considerable, it would take 10,000 reindeer to carry 1,000 tons, while one freight train or one large steamboat might carry the entire amount. It is in the distribution from terminal points and the collection for terminal points that the reindeer will be useful.

Another point of great usefulness is the light work of carrying the mail. Great speed for small loads is the favorable condition. With relays of 25 miles each, the possible speed in winter time of reindeer expresses, carrying a light load of mail, is 200 miles a day. If a route can be found, such as the Dalton trail is said to be, from Haines to Fort Selkirk or Circle City, the relays of reindeer could carry the mail in three days to Dawson City and in four days to Circle City. Return mail should be brought back in the same period. Supposing a railroad should be built to Dawson City or Circle City, the reindeer would not be useful in traversing the country over which the railroad passed, but he would be very useful in connecting the terminus of the railroad in the winter time with places down the Yukon River. Even the military camp at Weare, near the mouth of the Tanana, could be brought into communication with the War Department by reindeer express to Circle City, taking two days for round trip, and from the military camp near the mouth of the Tanana once a month to Point Barrow, requiring four days out and four days back, would keep the whole country in possession of the news regarding the fate of sailors caught in the Arctic seas and the missionaries who live in that remote region. A similar four-days express twice a month would bring the same news from Cape Prince of Wales and the missionary stations north and east of that point, and also those on the lines south and west and those on the Yukon. Another one three days out from the new military post at Weare would give the same information regarding St. Michael and numerous missionary posts south and southeast of that point. During the summer time the boats on the Yukon will bring the great bulk of freight up to the different distributing points.

ESTIMATES AND SUGGESTIONS FOR DISTRIBUTING REINDEER IN ALASKA, AND INDUCEMENT FOR LAPLANDERS TO BECOME SETTLERS AND HERD OWNERS.

The Lapps brought over from Lapland as teachers for the Eskimo apprentices, and also as the basis of the reindeer development in Alaska, are inquiring in what way they, as well as the Eskimo, can secure herds of their own. From the commencement of the instruction of the native men in the management of reindeer, the Bureau of Education has recognized the importance of securing the cooperation of the various missionary societies at work in Arctic and sub-Arctic Alaska.

Again I quote the Commissioner of Education:

It is evident that the missionary stations furnish the only safe centers for the location of herds and the establishment of schools of instruction in the rearing of the reindeer and in the training of them to harness.

As already mentioned, the missions ascertain the capable and teachable youth among the natives. They are able at any time to furnish a list of the natives in their vicinities noted for good character. At each of these stations 20 or 30 youth, selected from a village population of 300 or more, can be put in training as herdsmen and teamsters. No matter how large the Government appropriation should be, therefore, it would be necessary to connect the reindeer instruction and the establishment of permanent herds in northwest Alaska with these missionary stations.

Let small herds be loaned to each missionary station as a Government aid in the nature of an outfit of industrial apparatus. The report of the Indian Bureau shows that the United States Government furnished 10,000 head of stock for the period of 1890–1896 for one Indian agency (the Blackfeet), and that seeds, implement, stock, wagons, harness, in large amounts, have been furnished to other agencies. These donations are certainly more justifiable than donations made to prevent the savage people from starving, for they are given, in the form of apparatus, for the instruction of these peoples in the industrial arts and in the practice of thrift. All these things prevent starvation. Just as in the agricultural colleges of the several States the Government money is used to pay for the stock of the model farm, which is used as the apparatus for the instruction of the pupils, so the reindeer herd is used as apparatus loaned to the missionary stations for the purpose of instruction of the natives. But an average of five years' apprenticeship is needed for the full training of apprentices in the management of reindeer.

Persons who have been brought up to the care of neat cattle and horses or sheep only have not thereby acquired the art of managing reindeer, for this requires special apprenticeship. With the first herd (that of 1892) Siberian herdsmen were procured to give instructions in these arts; but the degree of success was so small that in 1894 five families of Laplanders were obtained to take their place. The Laplanders, being a civilized people and devoid of the superstitions which embarrass the Siberian natives, have attained a higher degree of skill in the management of this animal, and also show greater ability in teaching others what they know. Next after the obtaining of the reindeer the most important point, therefore, is the procurement of skilled herdsmen and teamsters from Norway and Sweden. It is of little use to give a herd of reindeer to a missionary station unless a skilled teacher goes with it.

Digitized by Google

The furnishing of the properly trained Laplander is one of the chief items of expense in the introduction of reindeer into northwestern Alaska. A salary of $500 a year is necessary for each, and the distribution of the herd at the different points on the seacoast and in the interior is possible only in so far as the Government is able to send these experienced herdsmen and teamsters. In the course of eight or ten years there will grow up a supply of thoroughly educated natives, who will render it unnecessary to depend any longer upon Lapland and Finland for teachers. But it is hoped in the meanwhile that there will be some migration from Scandinavia of families of herdsmen and teamsters.

To best accomplish the above, I would respectfully recommend the following general plan, which embodies the suggestions made by Mr. William A. Kjellmann from his own personal experience in the work, both in Alaska and in Lapland, in the latter of which he was born and brought up.

Loan each mission association 100 deer for five years on condition (1) that two Lapp families are kept in charge of the herd, the mission furnishing food, clothing, etc., and the Government paying the salaries for the Laplanders; (2) that at least four native men are kept and trained to the work; (3) that the mission receive 80 per cent of the net increase of the herd and the two Laplanders in charge 20 per cent, this 20 per cent to be held back by the Government in case the Laplanders should not become herders or teamsters; (4) that one of the Laplanders at each station occupied be appointed manager so far as herding and breaking in and the movement of the herd is concerned, the Lapp manager to report yearly to the Government inspector on his visit about the increase and general condition, etc., the mission station also reporting to the inspector.

Estimate of increase from 100 deer in five years.

	Males.	Females.	Total.
Original number	20	80	100
First year's increase	36	36	72
Second year's increase	40	40	80
Third year's increase	60	56	116
Fourth year's increase	80	72	152
Fifth year's increase	104	104	208
Total	340	388	728
Losses during the period			50
Total left			678
Property of the Government			100
Net increase left			578
Eighty per cent goes to mission			462
Twenty per cent to Government or Lapps			116
			578

RELIEF OF THE WHALERS IMPRISONED IN THE ICE NEAR POINT BARROW.

The relief of the whalers imprisoned in the ice at Point Barrow last winter was conducted under the auspices of the Treasury Department, yet as the principal means of relief were the reindeer herds taken from Prince of Wales and Cape Nome and driven over to Point Barrow, and as those herds were a part of the fruit of the work of the Interior Department in introducing domestic reindeer into Alaska, it seems proper that some account of that expedition should have a place in this report.

Through the courtesy of the Secretary of the Treasury and Capt. C. F. Shoemaker, chief of division of Revenue-Cutter Service, I have received copies of the original reports of the officers in command of the relief expedition. From these reports and from other reliable sources I have secured the following account of the situation of the whalers and their relief by the Government expedition in charge of Lieut. David H. Jarvis, of the Revenue-Cutter Service.

On the 8th of September, 1897, the steam whalers *Orca*, Capt. A. C. Sherman; *Jesse H. Freeman*, Captain Humphreys; *Belvedere*, Capt. M. B. V. Millard, and the schooner *Rosario*, Capt. Edwin Coffin, were caught in the slush ice to the eastward of Point Barrow, the northernmost point of the North American Continent.

Early on the morning of the 9th the danger was so great that the captains of the four ships had a consultation as to the best method of working their vessels out of the ice. The young ice was forming fast and a heavy ridge of old ice remained along the coast. The only method of escape seemed to be by blasting a canal

Digitized by Google

through the ice ridge a distance of about a mile and a half. A portion of the crew was at once set at work making cartridges weighing 5 pounds each, of blasting powder, gunpowder, and tonite powder, the latter of which was taken from the darting and shoulder bombs. These cartridges were placed on the ends of long poles, shoved under the ice, and exploded. A thousand pounds of powder were used and three days and nights consumed in making the canal. The remaining men of the crews were employed in sawing and poling the ice out of the canal. The fresh ice, however, formed so rapidly that the steamer *Orca*, in forcing its way through the canal, broke its rudder, and, becoming unmanageable, was taken in tow by the steamer *Freeman*. The captain of the schooner *Rosario* was afraid to attempt the passage through the canal, and hoped that the ice might open and afford the vessel a safe refuge in a lagoon near by. This hope, however, was not realized.

After getting through the canal the three steamers lay to until the *Orca* had repaired its rudder, and then steamed south 45 miles through increasing heavy ice to the neighborhood of Sea Horse Islands, which were reached September 22. On that date the steamer *Orca*, which was in the lead during the breaking and forcing of the ice, was caught between two immense ice floes, which wrenched the stern-post and steering gear completely out of place and hurled the wheel through the pilot house, the officers and crew taking to the ice for safety. Many of the officers and crew passed over the ice to the steamer *Freeman*. Shortly after the *Freeman* herself was caught in the ice jam and all on board took refuge on the ice. The steamer *Belvedere*, which had reached open water, immediately steamed back into the ice and rescued the officers and crew of both vessel. The wind blowing a gale from the westward forced both the old and young ice landward, and nothing was left for the *Belvedere* but to move with it, doing which the ship succeeded in getting into Pearl Bay, the heavy ice grounding outside and making a refuge behind it.

The *Belvedere* now had its own crew of 45 men, the 43 men from the *Orca*, and the 49 from the *Freeman*. Abandoning all hope of getting out of the ice, on the 23d of September the sailors commenced sledding provisions from the ship over the ice to the Sea Horse Islands, a distance of 3 miles. The water was pumped out of the casks to lighten the ship and the bulkheads were torn down for the purpose of making houses on shore. The blacksmith commenced making cooking stoves from the coal-oil drums, and others were set to work cutting a canal through the ice to enable the ship to get in behind the islands for greater safety, all the arrangements being made to winter at that spot. While these arrangements for camping on shore were going on, Mr. Charles H. Walker, fifth mate of the steam whaler *Orca*, volunteered, with a couple of natives, to go across the ice to the steamer *Orca* and save all the provisions they could, agreeing to make a signal upon his safe arrival at the vessel. The *Orca* was lying 12 miles away, with the ice between the two ships full of holes and the pressure of the heavy ice constantly making large cracks in the new ice.

On the 29th of September, failing to see any signals from the *Orca*, Mr. George F. Tilton, with four natives, was sent to learn the fate of Mr. Walker and his companions. After six hours' hard work the ship was reached and Mr. Walker and his men were found well and busy saving provisions. The ship was nearly full of water, and the provisions had to be fished out with long-handled bow hooks. In the meantime both ship and ice were drifting all the time. While engaged in securing the provisions a peculiar tremor was felt, the ship careened slowly over on its side and gradually slid under the ice floe and was soon completely hidden from sight. The men, having escaped to the ice, at once commenced sledding the provisions they had saved to the south sand spit of the Sea Horse Islands, which were about 3 miles to the westward. The moving of the provisions consumed two days. Some Eskimo were secured in the neighborhood with two teams of dogs, and on the sixth day all the food saved from the *Orca* was safely put on the steamer *Belvedere*. While the work of saving provisions from the steamer *Orca* was going on, some Eskimos boarded the steamer *Freeman* to help themselves to the provisions which had been left in that vessel when the sailors took to the ice. While engaged in looting the ship they accidentally dropped a lighted lamp, which set fire to the vessel, and it burned to the water's edge.

On the 3d of October Captains Millard, Porter, and Sherman, after consultation, determined to send to Point Barrow for help. Stephen Cottle, second mate of the *Belvedere*, and the four or five men of the steamer *Freeman* volunteered to go. It was a trip of 65 miles on foot, and it took three nights and two days to make it.

Mr. Charles D. Brower, superintendent of the Liebes Whaling Station, at once dispatched his assistant, Alfred Hopson, with six dog teams, to the rescue of the whalers, arriving at the steamer *Belvedere* on October 7. Forty men with provisions were immediately sent to Point Barrow, some of the men being so sick and feeble that they had to ride the entire distance. The trip was made in four days.

Digitized by Google

Returning to the *Belvedere* on October 13, Mr. Hopson made the trip in twenty-two hours. On the second trip he took 64 men and some provisions to Point Barrow. On the 15th of October the captains reached Point Barrow for a consultation.

Inventories of all the provisions on the *Belvedere*, at Point Barrow, and on the four whalers which were in the ice to the eastward of Point Barrow were made and placed before them. These were carefully gone over, and it was decided that by allowing each man two scant meals a day the provisions could be made to hold out until the 1st of July following. At Point Barrow the officers of the first-named vessels learned that the steamers *Fearless*, Capt. James McKenna, and *Newport*, Capt. G. B. Leabett, were in heavy ice, 5 miles off shore and about 60 miles to the eastward of the point. The steam tender *Jeanie*, Capt. P. H. Mason, was about 75 miles east of the point, and the bark *Wanderer* was about 360 miles east of the point, being within 90 miles of Herschel Island.

During the conference at Point Barrow it was decided to make an effort to send word to San Francisco, and volunteers were called for. Mr. George F. Tilton, third mate of the steam whaler *Belvedere*, and Mr. Charles F. Walker, fifth mate of the steam whaler *Orca*, were accepted for the trip. After every provision was made for their comfort, at noon on October 22 both expeditions left for the States, Mr. Tilton following the coast south of St. Michael and Shelikoff Straits, and Mr. Walker by the way of Herschel Island and up the Mackenzie River by way of the Hudson Bay Fur Company's posts to Edmonton, on the Canadian Pacific Railway, from whence he reached civilization.

Mr. Tilton was accompanied by two Eskimo runners, who had agreed to accompany him as far as Point Hope, which place they expected to reach in about fifteen days. It was on the 3d of January, when between Unalaklik and St. Michael, on Norton Sound, that Mr. Tilton met Lieutenant Jarvis and party on their way north to relieve the whalers, the news of the disaster to the fleet having been previously communicated to them. St. Michael was reached on January 6. Leaving St. Michael on the 16th, a trip of 320 miles, crossing mountain ranges, through a storm that destroyed some of their dogs, brought the party to Andreafski, on the Yukon River. In the winter of 1896–1897 William A. Kjellmann, superintendent of the Government reindeer stations, had made the same trip over the same mountains in the same kind of a storm with reindeer without any loss.

Securing fresh dogs at Andreafski, the journey was continued 180 miles across the portage to the Kuskokwim River. At that point, needing a fresh team of dogs, the traders at the place asked Mr. Tilton $1,000 for them. This would have prevented any further progress of the expedition had not the Rev. John H. Kilbuck, Moravian missionary at that place, loaned Mr. Tilton 13 dogs, provided provisions, and accompanied him as guide for 350 miles on his way to the next Moravian station, which was at Carmel, on the Nushagak River, arriving there on the 22d of February. At this point Rev. John Schoechert, missionary, supplied a fresh team of dogs and accompanied him as guide to Katmai, on Shelikoff Strait, a distance of 400 miles. These unpaid services of the missionaries are instances of the ready help extended to people in similar extremity everywhere by the missionaries. At Katmai an old dory was secured and mended up, in which a passage was made across the dangerous Shelikoff Straits to Kadiak Island. From Kadiak Island passage was secured on the steamer *Albion*, reaching Portland, Oreg., April 8.

While these events were transpiring in the far North it began to be noised abroad that a portion of the whale fleet had been caught and imprisoned in the arctic ice.

On the 3d of November Captain Tilton, of the steam whaler *Alexander*, reached San Francisco and reported that eight whalers were fast in the ice east and west of Point Barrow, and not being provisioned for so long a stay, the crews were in danger of starvation. This news was confirmed on November 5 by the arrival of the whaling vessels *Jeannette*, *Karluk*, *Gayhead*, and *Alice Knowles*. The attention of the President was called to the danger of the whalers, and at a Cabinet meeting held on the 8th of November it was decided to send a relief party at once, and the revenue cutter *Bear*, that had just returned from its usual summer arctic cruise, was ordered to make the necessary preparations and proceed as soon as possible to Bering Sea. It was the purpose that the *Bear* should proceed north until it reached the ice, and then land a party that should go to Point Barrow and take control of the whalers. As no practical plan could be devised to enable the relief party to take provisions with them, it was determined to borrow a herd of reindeer owned by the Eskimo at Cape Nome and a second herd owned by the American Missionary Association at Bering Straits. These reindeer were to be taken by the relief expedition to Point Barrow and, so far as needed, slaughtered for food. The trip being one of great hardship and danger, the Department called for volunteers to man the ship, and finally selected the following officers: Capt. Francis Tuttle, in command of the *Bear*; First Lieuts. D. H. Jarvis and J. H. Brown; Second Lieuts. E. P. Bertholf, C. S. Cochrane, J. G. Berry, B. H

Digitized by Google

Camden, and H. G. Hamlet; Chief Engineer H. W. Spear; First Asst. Engineer H. N. Wood; Second Asst. Engineers H. R. Spencer and J. I. Bryan, and Surgeons S. J. Call and E. H. Woodruff. Lieutenants Jarvis and Bertholf and Dr. Call were designated for the overland trip. Lieutenant Jarvis, who had made eight trips into the Arctic Ocean and was acquainted with the native population along the whole coast, was placed in command.

On the 29th of November the *Bear*, bidding adieu to civilization, steamed out of the harbor of Port Townsend in a blinding snowstorm on its perilous voyage. After a rough passage Unalaska was reached, in a thick snowstorm, December 9. The extra supplies for the whalers that would not be needed until the following summer were sent ashore. Taking on coal and water at Dutch Harbor at 1.35 a. m. December 11, the *Bear* headed north into Bering Sea, in a storm of hail, rain, and snow, its objective point being Sledge Island, where it was hoped the overland party could be put ashore. On the morning of the 13th St. Lawrence Island was passed, but soon after the ship entered mush ice and a little later the floe ice, which was so rapidly solidifying under the influence of the severe cold that at 5 p. m., when within 75 miles of Sledge Island, fearing the vessel would become permanently fast in the ice, the effort to reach Sledge Island was given up and the vessel headed toward Nunivak Island, with a hope of being able to reach Cape Vancouver. This would increase the length of the overland journey 800 miles, but it seemed to be the only point where a landing could be made. Cape Vancouver came in sight on the morning of the 15th, but was surrounded with young ice as far as the eye could see from the crow's-nest of the ship. After working slowly through the ice until the middle of the afternoon it was found that the village shown on the chart did not exist. It was rapidly growing dark, and just as the attempt was about to be given up for the day a village was dimly made out farther up the bay. On the morning of the 16th the ship got underway and made an anchorage near the village of Tununok. The local trader, Alexis Kalenin, and a party of natives were soon on board. They informed Lieutenant Jarvis that they expected to start soon themselves for St. Michael and would pilot his party. Accordingly arrangements were immediately made for landing the expedition and their supplies, This was accomplished with great difficulty, as the ice was running heavily between the ship and shore. Having landed the party, the *Bear* returned to Dutch Harbor, Unalaska, for the winter.

The expedition consisted of Lieutenants Jarvis and Bertholf, Dr. Call, and Mr. F. Koltchoff. The latter was engaged as a guide and to drive the dog teams. Upon reaching the house of the trader it was decided not to start for St. Michael until the 18th, the intervening time being employed in getting everything ready. The start was made early on Saturday morning, the 18th, with four teams and Alexis for guide.

On the evening of the 20th they arrived at Kiyiligamute. At that point, two of the dog teams having given out, the party was divided, Lieutenant Jarvis and Dr. Call pressing ahead, while Lieutenant Bertholf and Alexis and Koltchoff were to wait until they could get fresh teams. Lieutenant Jarvis reached Andreafski on the 24th and St. Michael on the 30th. The second party left on the 22d and reached St. Michael on New Years' Day, two hours after Lieutenant Jarvis had left for the north. Before leaving, Lieutenant Jarvis left instructions for Lieutenant Bertholf to proceed to the head of Norton Sound and transport the provisions across to Kotzebue Sound, while he and Dr. Call went to Cape Nome and Cape Prince of Wales to procure the herds of reindeer at those places. At St. Michael Mr. Koltchoff was discharged, and soon after engaged as guide for Mate Tilton on his return to the States. Great difficulty was met in procuring a sufficient number of sled dogs to enable the party to reach the reindeer. After many hardships, on January 10 Lieutenant Jarvis reached the Government herd en route between Port Clarence and Unalaklik. The next morning arrangements were completed and the party started with reindeer teams from the Government herd for Tsuynok, where Antisarlook and his friends had a herd of domestic deer. After refreshments and rest, Lieutenant Jarvis commenced negotiating for the herd of reindeer at that point. The herd represented to the Eskimo the living of a whole village, and if the herd departed it might mean starvation to themselves before spring, so that there was much point as well as pathos in the answer of Antisarlook's wife when she said: "Tell Mr. Jarvis we are sorry for the people at Point Barrow and we want to help them, but we hate to see our deer go, because we are poor and our people in the village are poor, and in the winter when we can not get seals we kill a deer, and this helps us through the hard times. If we let our deer go what are we to do? Antisarlook and I have not enough without them to live upon."

It seemed like reducing these people to starvation in order to save others, and in giving up their herd of deer for the sake of others it was like giving up their own

Digitized by Google

lives; yet, after consultation among themselves, it was finally agreed to, and Antisarlook was employed to go with his herd. At this place were 138 deer, 22 belonging to the herders. In making the arrangements, as there were 100 cows, Antisarlook was allowed an increase of 85, so that it would require 220 deer to be delivered to him next year to make good the promise of the United States Government to return him a herd of equal size, three having been killed for food for Antisarlook's family.

Having given Antisarlook's wife an order on neighboring stores for food supplies, and leaving Dr. Call to take charge of Antisarlook's herd and drive them up to the Teller Reindeer Station, Lieutenant Jarvis pushed forward to Cape Prince of Wales to get the second herd. While Dr. Call and his party were on their way to the Teller Station they encountered a blizzard so severe that the deer, blinded by the flying snow, turned and trampled over the drivers—however, without serious damage. They were compelled to retreat for three hours, when they found an old fishing hut and climbed in at the window. There they were held by the storm for three days, with only food sufficient for two days, and a long trip still before them.

On the 25th they made another start and reached the station on the 27th, just as a fresh blizzard was commencing. Lieutenant Jarvis reached Cape Prince of Wales on the 24th of January. On delivering to Mr. Lopp his mail, and explaining to him the necessity and object of the expedition, he had no difficulty in securing the herd of 301 deer at that place, with the agreement that 432 deer should be returned to them by the Government the following season. It was also agreed that Mr. Lopp and his herders should accompany the expedition, in charge of the reindeer. Arrangements had been made, and it was proposed that Mrs. Lopp and the children should go to the Teller Reindeer Station, from 60 to 75 miles distant, to remain with the Rev. and Mrs. Brevig; but the discomforts of the trip were so great, and she had such entire confidence in the affection of the Eskimos, that she concluded to remain at home, being with her children the only English-speaking persons in a community of 500 Eskimos.

On the 29th of January Dr. Call and party left the Teller Station and crossed the mountains, where they expected to form a junction with Lieutenant Jarvis and the reindeer herd from Cape Prince of Wales. The weather was thick and unpleasant, the barometer sinking rapidly, but, being in need of haste, the party pressed on through the storm and the mountains as best they could. Passing over the mountain range they were met by a storm so severe that they had to go into camp, and no sooner was the tent erected and covered with sleds to hold down the canvas, than it was drifted over with snow so deep that the following day it took them two hours to dig their way out. In the meantime the deer were scattered by the storm, and it was noon of February 1 before they were able to gather the herd together again. In the afternoon of February 2 a junction was made with Lieutenant Jarvis and the herd. The following day a start was made with 435 reindeer, of which 18 were broken to harness and reserved for transportation purposes.

On February 6 Lieutenant Jarvis and Dr. Call pushed on ahead for Sineraget, a village on the coast, en route for Point Hope, leaving instructions for Mr. Lopp to follow with the herd and meet him at Pitmegea, just north of Cape Lisbon. The route lay along the northern part of Cape Prince of Wales peninsula, about 15 miles from the coast, where deer moss was plentiful, to Cape Espenburg.

On the 12th of February Lieutenant Jarvis and Dr. Call reached Cape Espenburg, and although the ice on Kotzebue Sound was broken and piled up in a manner to deter an effort to cross it, they concluded to make the attempt and succeeded in crossing the sound to Cape Blossom, 50 miles away. Near Cape Blossom was the missionary station of the Friends, occupied by Mr. and Mrs. Robert Samms and Miss Hunnicutt. Here Lieutenant Jarvis met Lieutenant Bertholf, who had crossed from Norton Sound with 1,000 pounds of provisions, reaching the mission station on the 10th of February. After resting a few days, Lieutenant Jarvis and Dr. Call left on the 15th for Point Hope, leaving Lieutenant Bertholf to await the arrival of Mr. Lopp and the herd and then to follow northward.

On February 16, Mr. Lopp, with the deer, reached Cape Espenburg and held a consultation with reference to the possibility of driving the deer and taking the sleds across the broken ice covering an arm of the Arctic Ocean from Cape Espenburg 40 miles to Cape Krusenstern. After much hesitation it was decided to make the attempt. During the first day the reindeer made 30 miles; in many places the attendants had to cut a road over hummocks of broken ice. The second day food gave out for the drivers, and of course there was no moss for the deer on the ice. The reindeer, remembering that they had left fields of moss behind them, continually broke loose to return over the ice. This made it very difficult driving, and they were out the second day and all the second night, without food,

Digitized by Google

before reaching land again at Cape Krusenstern. There, receiving a letter from Lieutenant Jarvis informing him that Lieutenant Bertholf with supplies was at Cape Blossom, Mr. Lopp, leaving the herd, went to meet Lieutenant Bertholf.

Loading the supplies on reindeer and dog teams, a start was made for the herd at Aneyok village, which was reached on the 19th. The deer having rested, a start was made on the 21st, following along the coast as far as the mouth of the Kevuleek River, where Mr. Lopp, with the deer, was to proceed inland, leaving Point Hope to the westward. Lieutenant Bertholf, taking a team, proceeded direct to Point Hope, reaching there on March 2. Finding a considerable store of provisions at Point Hope, Lieutenant Jarvis instructed Lieutenant Bertholf to remain there and take charge of any whalers that might be sent down during the winter. Lieutenant Jarvis and Dr. Call, having made all necessary arrangements at Point Hope, left on March 4 for Point Barrow. Lieutenant Jarvis had instructed Mr. Lopp to meet him at Petmegia, just north of Cape Lisbon. When Lieutenant Jarvis reached the place of meeting, all that was visible above the snow was a wooden cross, with this inscription: "Letter between boards; arrived here March 7; look out for the train." Just below the board, stuck in the snow, was a second board, on which was written: "Deer meat here."

On the 13th of March they reached the camp vacated by the herd that morning, and on another cross found a note reading: "Will try to find better moss on the inside of the lagoon. Leave here March 13." During the 14th a storm of unusual severity raged, thermometer registering 40 degrees below zero. The same storm continued through the 15th and was worse on the 16th. To add to the distress and danger of Lieutenant Jarvis, his dog teams had nothing to eat. About noon on the 17th a party of natives were discovered, who brought a note from Mr. Lopp stating that he had left there that morning, and soon after the herd was seen on the horizon, moving over the rolling white hills. Lieutenant Jarvis pushed his team ahead to overtake the deer 10 miles away. Arrangements were made to meet Mr. Lopp at Icy Cape. Arriving there on the 22d in a fearful storm, nothing was seen of the herd, which during the storm had passed within a mile of the camp. On the next day a board was found with the message: "Arrived here 1 p. m. Tuesday, March 22. Think we are passing Icy Cape. Find meat in the mouth of the cache. Think sledge deer will hold out. Find better moss on the inside of the lagoon." This was welcome news to Lieutenant Jarvis, for it meant that he could save his dog teams from starvation.

At noon on March 26 Lieutenant Jarvis, looking over the ice, exclaimed: "There is the first of the imprisoned fleet," as he caught sight of the tall mast of the *Belvedere*, 12 miles away.

Point Barrow was reached by Lieutenant Jarvis on March 29, and the herd of reindeer arrived on the 30th, safe and sound.

Thus successfully ended a trip of 2,000 miles through the desolations of an arctic wilderness in midwinter, over an unknown region, and among many wild tribes. The narrative of the trip is a story of bravery, good generalship, heroic endurance, and interpositions of Divine Providence—a trip only equaled by that of Mates Tilton and Walker, who went out with the news, and the return trip of Mr. Lopp to his home at Bering Straits.

Turning over the herd to Lieutenant Jarvis at Point Barrow, Mr. W. T. Lopp, taking a dog team, started on his return trip to his own home at Cape Prince of Wales. As provisions had been left for himself and the dogs in caches along the way, he was able to travel light. On his return trip he reached Point Hope April 19, left on the 23d, and reached Cape Prince of Wales on May 5, thus having, together with his herders, driven a herd of reindeer over the bad roads of snow and ice, through a country but little known, in the middle of winter, dragging all his provisions with him, a distance of 700 miles, and returning to his home the same distance, in the remarkably short time of three months and two days.

It has frequently been said during the efforts to introduce domestic reindeer into Alaska that the Eskimos could not be taught their care and management, and that they would never take to herding reindeer, but on this remarkable trip it must be remembered that the herders and drivers were all Eskimos who had learned their business as apprentices at the Government training station for reindeer, and that without this herd of reindeer food could not have been taken to the whalers, and without the trained Eskimo the reindeer could not have been driven across the country. This striking object lesson should forever set at rest the assertion that the Eskimos will not take to the raising of reindeer if a chance is given them.

From Cape Prince of Wales to Point Barrow the expedition found abundant pasturage for the reindeer. It passed through numerous villages of natives, who were greatly interested in the herd of reindeer, not only as a matter of curiosity, but because they appreciated the benefit that a herd of domestic reindeer would

Digitized by Google

be to them and their people. Wherever they went the natives questioned Lieutenant Jarvis with regard to the possibility of their securing some reindeer for themselves and their children. If the deer were to be had in sufficient numbers, hundreds of the Eskimo men would gladly serve an apprenticeship of five years in order to get a start in reindeer raising.

In this connection it is appropriate to call public attention to the influence of the mission schools in making arctic Alaska safe for the transit of white men. In 1890, when the Congregational Mission was established at Cape Prince of Wales, no whaler had dared drop anchor in the neighborhood of that village for ten years; and the placing of missionaries there was considered by the captains of the whalers as a foolhardy undertaking. The missionaries were placed there, and now ships can anchor and their crews go on shore with safety.

When, in 1881–1883, Lieutenant Ray, United States Army, was placed in charge of the international polar expedition at Point Barrow, a turret was built at one corner of his house and armed with cannon to protect his party from the natives. Now the Presbyterian Mission has so civilized the natives that no fortified habitation is necessary. Under the influence of the Presbyterian missionary the natives not only provided the shipwrecked sailors with food from their own scanty supply, but also with necessary fur clothing. The influence of the missions made possible Lieutenant Jarvis's heroic trip unarmed.

After the departure of Mr. George F. Tilton, October 22, to carry the news to the States, Dr. H. R. Marsh, Presbyterian missionary at Point Barrow; Mr. Charles D. Brower, agent of the Liebes Whaling Company, and Mr. McIlhenny, a scientist making an arctic collection, the three leading white residents of the point, immediately set themselves to provide for the welfare of the shipwrecked whalers that had been thrown upon their hands. Mr. Brower at once arranged to issue rations from his stores to the men; the Eskimos were sent into the surrounding country to get wild game, both for themselves and the suffering whalers; Dr. Marsh gave his time and medical services to saving the men from scurvy and other diseases that would otherwise have caused the loss of many lives; all the houses in the place were put at the disposal of the wrecked men, each one taking into his own home all that could be accommodated.

During the latter part of November, when it seemed that starvation awaited them, small herds of wild deer were seen on the rolling hills to the south of the village, a thing that had not been known for many years, so that the natives were able to procure for the use of the community 12,604 pounds of deer meat, 8,692 pounds of fish, and 2,506 pounds of wild fowl, with some 2,500 to 3,000 pounds or more of meat in the country, which was afterwards brought in by the deer men and sledges, under the direction of Lieutenant Jarvis. Some of this meat was hauled a distance of 230 miles. This unusual and providential supply of deer meat kept the party alive until the arrival of Lieutenant Jarvis with his herd of domestic reindeer. During the remainder of the winter 180 deer were killed from the domestic herd.

On the 29th of July, 1897, the steam whaler *Navarch* was caught in the ice about 2 miles west of Point Barrow and carried by the ice pack to the northwestward. On August 3 the ship was abandoned, the crew taking to the three boats, which were dragged for three days over the ice and then abandoned, each man taking such bread as he could carry. After going a little farther they met with open water, and were finally compelled to return to the ship, 18 miles distant.

On the 11th of August 29 of the crew deserted the vessel for the shore. On the evening of the eighth day from the ship coming to the pack they got upon a small cake of ice, which drifted them inshore for three days, and on the 22d of August they were seen and picked up by the steamer *Thrasher*, having had nothing to eat for eight days but ice and boot soles, only 16 of the 29 living to be rescued.

On the 14th of August Captain Whitesides and his wife and six of the crew left the vessel, dragging a small canvas canoe with them. After many dangers and great hardships they succeeded in reaching the shore, and three days later were discovered and picked up by the revenue cutter *Bear*. Nine of the vessel's crew refused to leave the whaler, deeming it safer to remain on board than to risk the journey over the ice; seven of these, however, later made the attempt to reach the shore and were saved. Two of the sailors refused to leave the vessel and have never been heard from. Very strangely, however, the *Navarch*, which had been caught in the ice in July and abandoned, after making a trip by itself into the far north drifted back into the neighborhood of Point Barrow four different times, the last time to within 2¼ miles of the shore and was caught and held firmly by the ice. Each time that she approached the village, wrecking parties were sent across the ice to secure the coal and provisions which had been left on the steamer when she was abandoned six months previously. This coal was of the utmost service during the winter, as the driftwood along the shore had been used up and

Digitized by Google

the coal supply was very short. After all the provisions and nearly all the coal had been removed, about 4 o'clock on the evening of September 3 the vessel was seen to be in flames and burned to the water's edge, the fire having been started by two of the sailors, who received their punishment later, when during the winter there was not fuel enough to keep them comfortable.

Upon his arrival Lieutenant Jarvis made a tour of inspection and found that there were 100 men quartered at the village, 76 of whom were crowded in the old building formerly occupied by the Pacific Steam Whaling Company. At the request of Lieutenant Jarvis, Dr. Marsh, Professor McIlhenny, and Mr. Brower consented to an increase of the number already quartered upon them; in the meantime a storeroom had been sufficiently emptied of provisions so that a number of them could be placed in that. This made them more comfortable. There being much suffering on account of scanty and insufficient clothing, Lieutenant Jarvis secured a large amount of fur clothing from the Eskimos, which was freely contributed from their stores for the use of the men. Lieutenant Jarvis took command of the station, issued rations, communicated with the various ships, sent out parties of native hunters, which brought in supplies of wild meat, and so controlled matters that when the *Bear* was finally able to reach the place and take off the men they were found in much more comfortable circumstances and healthier condition than could have been expected.

The schooner *Rosario*, after wintering safely, was crushed in the ice July 2. Captain Neuth, of the *Jeannette*, who was sick, was brought down on the *Bear*. A petty officer of the *Orca* had committed suicide by drowning early in the spring. In June Phil Mann, of the whaler *Jessie Freeman*, had dropped dead of heart failure. Gray, of the steamer *Jeanie*, had died of the dropsy. A Siberian and a Japanese attached to the fleet had also died.

There being indications that the ice was breaking up in Bering Sea, the cutter *Bear* left its winter quarters at Unalaska and Dutch Harbor on the 14th of June, and sailed north for Point Barrow.

On the 19th, to the north of St. Lawrence Island, heavy ice was encountered, slowly working its way through which the ship reached St. Lawrence Bay, Siberia, on the 22d, and the following day reached Cape Prince of Wales, where an interview was had with the missionary, W. T. Lopp, who gave the captain a full account of the condition at Point Barrow while he was there. Learning that there was a scarcity of clothing among the whalers, Captain Tuttle turned back and steamed over to St. Michael, where a supply was laid in. Returning to Bering Straits and passing into the Arctic Ocean, Point Hope was reached July 15 and Point Lay on the evening of the 18th. Off Icy Cape the heavy drift ice prevented further progress northward, and compelled the *Bear* to anchor off Point Lay. Another fruitless effort was made on the 22d, and also on the 23d, to force the vessel through the ice. On the 25th, the ice opening a little, an effort was made to reach Wainwright Inlet, but before doing so the fog shut down so thick as to compel the ship to anchor.

On the 27th another start was made, and by pushing through the heavy drift out to sea they were able to reach the station at Cape Smyth on the morning of the 28th. On the 29th 93 officers and sailors were taken on board.

While waiting for the crew of the *Rosario*, which was 8 miles away, the *Bear* was subjected to a terrible ice jam and nearly crushed. There was a high ridge of shore ice between the cutter and the shore, behind which, in open waters, the three whaling vessels—*Fearless*, *Newport*, and *Jeanie*—were safely at anchor, but all access to which was closed by the ice, so that the *Bear* could not get in. A strong southwester had set in, drifting the ice floes with great force against the *Bear*, which was caught between them and the ridge of shore ice, and the staunch vessel came near being cut to pieces. A sharp ledge of ice under water abreast the engine room pushed in the sides of the vessel until the floor of the engine room was bent up fully 6 inches. In this jam the cutter was kept for two weeks, until August 17, when it got out by blasting through two ship's lengths of ice.

Getting afloat, sufficient coal and provisions were given the whalers to enable them to reach other supplies, and the *Bear* started on its return to civilization. A stop was made at Point Hope on the 20th, where it was found that the schooner *Louise J. Kenney* had been forced on the beach by the ice on the previous day. Her officers and crew were taken on board.

After making several stops the *Bear* arrived at St. Michael on the 25th of August, and reached Seattle on the 13th of September, where a congratulatory telegram was received from the Secretary of the Treasury extending thanks to the officers and crew for the successful issue of the work of the overland expedition for the relief of the ice-bound whalers.

It remains for a grateful country, that rewarded the heroes of Manila and Santiago with promotions, to see that Lieutenant Jarvis be not forgotten. Had not

Digitized by Google

the events of the Cuban war distracted the attention of the nation, this wonderful trip of 2,000 miles overland, north of the Arctic Circle, in midwinter, would have filled the columns of the newspapers on this continent and in Europe. Occurring at a time when other events claimed the attention of the public, it is no less deserving of its reward.

COMMISSION TO LAPLAND.

On the 23d of December, 1897, I was directed by the Secretary of the Interior to report to the Secretary of War for temporary duty in connection with the duties enjoined by the act of Congress approved the 18th of December, entitled "An act authorizing the Secretary of War, in his discretion, to purchase subsistence stores, supplies, and materials for the relief of people who are in the Yukon River country, to provide means for their transportation and distribution, and making an appropriation therefor;" and on the same date (December 23) I received written instructions from the Secretary of War to proceed at once to Norway and Sweden and purchase 500 reindeer, broken to harness, with sleds, harness, and drivers for hauling supplies into the Yukon Valley and transport the same to the United States.

Lieut. D. B. Devore, U. S. A., was appointed to accompany me as disbursing officer.

On the evening on the same day I left for New York, and on the following day held conferences with the managers of the several trans-Atlantic steamship companies centering in that city with reference to the transportation of the reindeer and Lapps to the United States.

In the spring of 1894, acting for the Bureau of Education, I had brought to the United States seven Lapp families to take charge of the domestic reindeer that the Government had commenced introducing into Alaska from Siberia and to teach the natives the management of the same. These families came under a three years' contract, at the expiration of which they were to be returned to Lapland, if they so desired. The limit having been reached in 1897, four families asked to be returned to their homes, which was done, and Mr. William A. Kjellmann, superintendent of the reindeer stations in Alaska, was sent in charge of them, with the double purpose of not only conveying them safely to their native country, but also to procure a number of Lapps who would come to the United States with the expectation of making it their permanent home and engage in the raising and training of reindeer in Alaska. Consequently, when this unexpected demand of the Government for reindeer and Lapps arose, in accordance with the directions of the Secretary of War, I telegraphed Mr. Kjellmann from New York of the changed conditions and instructed him to engage and send out all the assistants he could use to expedite the purchase of reindeer and the securing of Lapp colonists.

On the evening of December 24 Lieutenant Devore and myself took passage on the steamship *Lucania*, of the Cunard Line, and early Christmas morning were on our way to Liverpool, which we reached at noon December 31. Upon the arrival of the steamer we were met by representatives of the White Star Line, who wished to bid for the transportation of the reindeer. After a conference with them we took the train to London. On New Year's morning I received a telegram from Mr. William A. Kjellmann, agent of the Department of the Interior, who had reached Norway, asking for funds. This was in answer to the telegrams from the Secretary of War to proceed at once to purchase reindeer.

The Lapps, who alone have the reindeer for sale, are a semicivilized people, unaccustomed to commercial methods. They have no confidence in a "promise to pay." A would-be buyer must show his money, and at least make a partial payment at the time of purchase. Hence Mr. Kjellmann could accomplish but little until he had funds in hand.

Although it was New Year's Day, we found that the banks would be open during the forenoon, and Lieutenant Devore and myself proceeded to visit the leading bankers and telegraph companies of London, but, strangely, no one could suggest any method of getting money to Mr. Kjellmann sooner than by sending a check by mail. As there was a prospect of considerable delay in chartering a steamship, we decided in the afternoon that Lieutenant Devore should remain in London and secure a steamer and that I should push on to Lapland with money for Mr. Kjellmann.

January 3 I learned at the office of the Atlantic Transport Steamship Company that the department of agriculture of the English Government, to protect English cattle from the foot-rot which had broken out in southern Sweden among some of the cattle, had recently issued a circular forbidding the introduction into England of any stock from Norway and Sweden. Not only was stock of all kinds forbidden

Digitized by Google

to land in England, but ships carrying such stock to other countries were to be quarantined twenty-one days before being allowed to load other cattle to return to England. As this threatened to greatly increase the expense and the difficulty of chartering a ship, I proceeded to the American embassy, where it was suggested that I visit the British department of agriculture and talk over the matter unofficially with the officer in charge, and find out if any official action would be necessary. I found that the officer wanted was the first assistant secretary of agriculture. He took much interest in the proposal to procure reindeer to relieve the destitute miners in the Yukon, and suggested that we secure a steamer not engaged in the cattle trade and take the reindeer direct from Lapland to America, which suggestion was afterwards carried out.

Leaving London on the evening of January 3, I reached Christiania, Norway, on the morning of the 6th.

At 10 a. m. I presented the American consul, Mr. Henry Bordewich, of Minnesota, a letter from Secretary Sherman to American officials in Sweden, Norway, and Denmark, to render all possible aid in securing reindeer. In company with the consul, a call was made upon the secretary of the interior of the Norwegian Government, who gave me a circular letter to the Norwegian officials in Lapland requesting them to extend all assistance in the enterprise.

On the morning of January 7 I took the train for Trondhjem. After leaving Hamar the train crosses over from the vicinity of Lake Mjosen to the valley of the celebrated River Glommen, along whose winding banks it gradually ascends until the high mountain levels are reached in the neighborhood of Roros, on a dreary and inclement plauteau, 2,060 feet above the water. This is a famous region for reindeer moss.

At midnight I reached Trondhjem, and taking an omnibus was soon settled at the Grand Hotel. On January 8, as soon as the banks were opened, I made a deposit of $1,000 for Mr. Kjellmann, which was telegraphed to Alten, Lapland, to his credit.

Owing to its nearness and accessibility by rail with the mountain plateaus, Trondhjem is one of the best markets in Norway for procuring reindeer moss. A few weeks previously Mr. Kjellmann, while en route to Lapland, visited the traders and farmers in the neighborhood and arranged for several hundred tons of moss to be delivered at Trondhjem. I now completed that purchase of moss, and arranged with Mr. E. A. Tönseth's commission house for its reception and shipment upon the steamer that was to be chartered to carry the reindeer, and which would call at that harbor for the moss.

At midnight, upon the arrival of the train and mail from Christiania, the steamer *Vesteraalen* sailed for Tromsoe.

At 5 a. m. January 11 I reached Tromsoe, and, transferring from the steamer *Vesteraalen* to the *Sigurd Jarl*, at 7 a. m. the steamer was on its way to Hammerfest, which place we expected to reach the same evening, but the sea was so rough and the snow squalls so blinding that we did not get there until 2 o'clock the following day.

About 2 o'clock in the afternoon of January 12 we dropped anchor in the harbor of Hammerfest, the most northern city in the world. At this season of the year the sun is not visible from November 18 to January 23. The city is lighted with electric lights. It carries on a busy trade with Russia and also with Spitzbergen.

As soon as the ship dropped anchor I was transferred by rowboat directly to the steamer *Nor*. This was one of the small steamers which makes side trips up the fiords, the special route of the *Nor* being the Alten Fiord, at the head of which lies the village of Bosekop, which was my destination.

Soon after my arrival I was handed a number of telegrams with reference to the work in hand.

On Sunday morning, January 16, Mr. Kjellmann arrived from the interior, having been delayed two days on the mountains, where he was lost in a blizzard, riding nearly all Friday and Saturday nights and the intervening day without sleep. He reported the welcome information that the 500 trained reindeer that had been ordered, together with sleds, harness, and 50 drivers, had been secured. He had sailed from New York December 1, 1897, and reached Bosekop, Lapland, on the 23d.

While passing through Washington, November 30, he had a conference with the Commissioner of Education and the general agent of education for Alaska, at which time he was informed that possibly Congress would make an appropriation for the relief of the miners in the Yukon Valley, and if so he might be called upon to purchase reindeer and procure drivers for the same; in view of which he was directed while en route to make such inquiries that if telegraphed to procure deer he could do so with but little delay. Therefore, on his arrival, December 12, at Aalesund, the first port reached in Norway, he telegraphed to various centers

Digitized by Google

where it was thought reindeer moss could be had in quantity, the replies to be sent to him at Trondhjem, which place he reached the next day. Arriving at Trondhjem, he found that the only place where the moss could be had in abundance was at Roros. Accordingly, on the 14th he took the train to Roros, and on the 15th went around among the farmers investigating the supply. Finding that a sufficient quantity of moss could be had, he arranged with Mr. A. Skjerdingstad, a local merchant, to procure and ship 250 tons, if it should be wanted. On the 16th he returned to Trondhjem, and on the 18th took the mail steamer *Vesteraalen* for Tromsoe, where he arrived on the 21st. Transferring to the connecting steamer, Hammerfest was reached on the 22d. At Hammerfest he received a cablegram of December 22, from the Secretary of War, asking if 600 reindeer could be purchased. Leaving Hammerfest on the morning of the 23d of December, that evening brought him to Bosekop, at the head of Alten Fiord, which was to be his headquarters.

Upon arriving at Bosekop he received the cablegram of December 23 from the Secretary of War, directing him to purchase 500 reindeer, etc. On the morning of December 25, before leaving New York, according to instructions from the Secretary of War, I cabled him to hire all the help he needed to expedite matters and to send out in different directions. Consequently, borrowing 1,000 kroners, on December 29 he hired Mr. Per Rist and sent him to Kautokeino, 112 miles over the mountains, and on the 31st Mr. Samuel Kemi (both Lapps, returned from Alaska), who was sent to Enare, Finland, 265 miles distant, and Mr. Carl Suhr to Sjus Javre, 101 miles, to bargain for trained reindeer, sleds, and harness. The same day he wrote Mr. A. Paulsen, a merchant at Karasjok, and arranged with Mr. O. Kjeldsberg, another merchant, to advance money for the purchase of moss. Having set matters in motion, he was compelled to wait at Bosekop for funds. While thus waiting he closed by telegraph a contract with Mr. A. Skjerdingstad to deliver 900 horse loads of reindeer moss at the Roros depot—500 loads at 7 kroner per load and 400 loads at 8 kroner per load—to be delivered to me or to my order.

Upon arriving at Trondhjem, January 8, I arranged that the moss should be shipped to Mr. E. A. Tönseth, commission merchant, at Trondhjem. I have already referred to the unsuccessful efforts made in London to forward money to Mr. Kjellmann, and that it was not until I reached Trondhjem, January 8, that I succeeded. Receiving this money on the morning of January 9, Mr. Kjellmann left the same forenoon with reindeer team for Kautokeino to meet and receive the reports of the several men that had been sent in advance to make contracts. Reaching Kautokeino on the 11th, he found his lieutenants waiting for him with the welcome news that the whole number of reindeer, sleds, and harness were secured. On the 12th Mr. Kjellmann signed contracts with 23 Laplanders as drivers and on the 13th started on his return to Bosekop to report progess to me and secure additional funds for further payments. Encountering a blizzard in crossing the mountains and losing his way, he did not reach Bosekop until the 16th. Securing from me additional funds, on the 18th Mr. M. Kjeldsberg, and Mr. Per Rist were sent to Maci and Kautokeino to complete payments and bring the reindeer, sleds, and harness, with the drivers and their families, to Bosekop for shipment. On the 19th Mr. Kjellmann left for Sjus Javre to do the same thing for that section. On the 21st Mr. Carl Suhr was dispatched from Sjus Javre to Bautajok, 162 miles, and Mr. Samuel Kemi to Enare, to assemble and move to Bosekop the reindeer, drivers, etc., procured at those places.

Having started his lieutenants, Mr. Kjellmann himself left Sjus Javre on the 21st for Karasjok, where, on the 24th, he contracted with the drivers and paid for the reindeer which had been secured by Mr. A. Paulsen.

Final settlements having been completed, Mr. Kjellmann started on the 25th to return to the coast, reaching Bosekop on the 28th, in the midst of a furious storm, the most severe of the winter. That storm, which had been raging almost without cessation for three weeks, piling the snow in great banks along the fences, filling lanes full above the fence tops, and obliterating all evidences of roads or tracks in the open country, had been gradually increasing in severity until, on the 26th, 27th, and 28th of January, it had turned into a blizzard, culminating on the 28th in the worst day of the season. The hotel at Bosekop, a strong log building with a substantial stone foundation, in a sheltered spot, trembled under the furious blasts of wind and snow. At midday houses a block away could not be seen through the driving snow. All traffic was suspended in the street; and yet on the mountains, where the cold was much greater and the wind swept with the force of a hurricane, were four herds of reindeer, and between one and two hundred men, women, and children in open sleds, facing the blizzard as, on different roads and widely separated sections, they were centering into Bosekop. While anxious lest they should be detained by the storm and perhaps some of the children perish, I received a call from the mayor (landsman) of the village. Inquiring what were the pros-

Digitized by Google

pects of the Lapps getting through, he shook his head, saying that nothing could face that storm for any length of time and live. And I doubt whether any other race than the Lapp, that was cradled in the snow and inured from childhood to hardship, could have done so, or any other animal than the reindeer have brought them safely over the storm-swept and trackless mountains.

About noon, going to a window and with a knife scraping off the frost in order to get sight of a thermometer hanging outside, I saw faintly through the whirling snow a solitary reindeer coming up the street, and soon after could make out a sled with a man incased in ice and snow. It was Mr. Kjellmann, his great fur coat covered with snow and his face and whiskers incased in a mask of ice.

Toward evening a Lapp arrived, announcing that Mr. Mathis Rira, with a band of 90 deer, had arrived from Maci and gone into camp in the mountains back of the village. And on the afternoon of January 31 we were cheered by the safe arrival of the other three bands. Driving out with reindeer teams 7 miles to the crossing of Alten River, we met Mr. Carl Suhr and Mr. Samuel Kemi, with 4 men and 114 head of deer, from Bautajok, 165 miles distant. They were sent into camp on the east side of Alten River. Returning to Bosekop, we were met by a messenger announcing that Mr. M. Kjeldsberg and Mr. Per Rist, from Kautokeino, with 44 Lapps and 252 head of deer, had arrived and gone into camp.

While we were rejoicing in their safe arrival another messenger came with the news that Mr. A. Paulsen, with 29 Lapps and 90 deer from Karasjok, had also arrived and gone into camp outside of the village. The three parties, starting from places a hundred miles apart and journeying by different routes, had reached the rendezvous within a few hours of one another.

On February 1 the little village of Bosekop awoke from its Arctic night to unusual stir and activity as the Lapps and deer came pouring in long lines over the hill into the village, filling up Market square. The hundreds of Lapps, in their bright-colored, picturesque national dress, those that were going away and those that had come to see them off, greeting old friends and meeting new ones, the unpacking of sleds and preparations for embarkation, all made a picture never to be forgotten. All was bustle and excitement. By night everything was ready for the arrival of the steamship, and the first part of the expedition—the purchase of reindeer, sleds, and harness, together with the securing of competent drivers—was an accomplished success. The greatness and extent of this success is heightened by the environment.

First. If we had not needed deer trained to harness we could have bought a whole herd, and thus secured over 500 head in one transaction; but needing only trained ones, they had to be picked up in small lots of three and four out of a herd—perhaps four from the first herd visited, then five or six out of the second herd, 15 or 20 miles away, and then two or three from a third herd located on an almost inaccessible mountain off the usual line of travel. The seven men that had been out buying ranged from the ocean eastward across northern Norway to the edge of Russian Finland. This aggregated 3,000 miles of reindeer travel.

Second. This 3,000 miles of reindeer sledding had been made in a region from 3 to 4 degrees of latitude north of the arctic circle and during the arctic night, when the sun does not appear above the horizon from November 18 to January 23; 3,000 miles of sledding through long reaches of unsettled forests, over storm-swept mountains, and along the edge of dizzy precipices in the darkness of night.

Third. This 3,000 miles of travel had been made in the middle of the arctic winter, when fearful storms are of frequent occurrence. The mountain passes crossed and recrossed during January are as difficult and dangerous as the Chilcat Pass of Alaska.

Fourth. The hindrance arising from heredity and the custom of centuries was great. If we had gone into wide-awake and intelligent New England and proposed to a laboring man to break up his home, settle his affairs, and start in two weeks with his family to travel in midwinter, in an open sled, from 100 to 200 miles to take a railroad to Alaska, he would have said to us "the time is too short." Much more, then, is the time considered too short when we come to the nonprogressive Lapps, whose ancestors have occupied the same country from the beginning of their history, whose young people have never been found among the emigrants flocking from all nations to America, who beyond all other nationalities have clung to their ancestral homes, and ask them to break up their homes, dispose of their property, settle their affairs, visit parents or other near relatives perhaps for the last time on earth, and be ready in two weeks to start for the end of the earth. And all this was accomplished within a month from the time the appropriation was made by Congress.

In the meantime Lieut. D. B. Devore had chartered the transport steamer *Manitoban*, of the Allan Line, Glasgow. Sailing from Greenock, Scotland, January 16, she arrived at Trondhjem January 23 for the purpose of loading up the moss

Digitized by Google

which had been gathered there for the use of the reindeer herd. A severe storm detained the vessel at Trondhjem until the 29th, when she sailed, reaching Bosekop on February 2. Learning that the steamship had arrived, I went on board, and arrangements were quickly consummated for loading the Lapland reindeer. A large barge was taken over to the ship, upon which was built a platform, from which a gangway was erected to the ship. The reindeer were brought over from the shore to the barge in rowboats, and from the rowboats led up the gang plank directly into the ship. That the deer might be loaded more compactly and to prevent their being injured during the trip, their horns were sawed off within an inch of the flesh. During the first day 300 deer, 200 sleds, and considerable baled moss were loaded on the steamer. The work was pushed vigorously all day until 7 p. m., when the tired men refused to work longer, even for extra pay.

On the morning of February 3 work was resumed at 6.30 o'clock. The day was bitter cold, with a light wind blowing from the mountains. By 10 o'clock all the deer that were in the place had been sent off to the ship, but there was still a herd of 140 that had not come in from the mountains, where it was awaiting the arrival of the ship. Extra men were sent to assist in lassoing them, and as fast as they were brought to the barge their horns were sawed off, and they were rushed aboard the ship. By 6 p. m. the deer were all on board, the balance of the sleds were sent aboard, and also the harness packed in large casks. The drivers and their families went on board during the evening. About midnight I removed from the hotel to the ship, and at 4 a. m. on Friday, February 4, the anchor was hoisted and we were off for New York.

The officers of the steamship *Manitoban* were Capt. Andrew E. Braes, Chief Officer James Buchanan, Second Officer Charles S. Cheeper, Third Officer Robert M. McMaster, Fourth Officer D. O. Hagan, Chief Engineer John Stett, Second Engineer Mr. Day, Surgeon Wolf. We had on board 539 reindeer, that cost on an average $10 each; 418 sleds, at $3.60 each; 511 sets of harness, at $2.50 each. There were also on board 43 men, 16 women, and 19 children, Lapps; 15 men, 3 women, and 7 children, Norwegians; and 10 men, Finns; making 78 Lapps, 25 Norwegians, and 10 Finns, or 113 emigrants. Of the women, 16 were married, 6 of them recently. Among the Lapp men was a Mr. Samuel Johannesen Balto, who accompanied Nansen in his famous trip across Greenland, for which he received a silver medal from Oscar II, King of Sweden and Norway. There was also in the company Johan Petter Stalogargo, a Finn, who has the distinction of being the northernmost mail carrier in the world, having for eight years carried the mail on his back to North Cape, Norway, traveling on skis (Norwegian snowshoes). Among the 68 men were 13 who had had experience in carrying the mail with reindeer teams across the mountains and canyons and plains of arctic Lapland. (For a detailed list of colonists see Appendix, pp. 105, 106.)

Mr. Kjellmann and myself were the only cabin passengers. Lieutenant Devore returned to the United States by way of Trondhjem and London. The first two days out we had a fair wind and smooth sea, but on February 8, when off the coast of Ireland, we encountered a heavy head wind, which lasted for nine days, increasing in violence from day to day until on February 15 it had reached the proportions of a gale. On the 14th one of the lifeboats was wrenched from the davits and so badly stove in on deck that it had to be broken up. Some of the 2-inch plank bolted together around the cattle pens on the hurricane deck were wrenched apart and broken in pieces, and the 130 reindeer in pens on that deck were drenched with the seas that broke over them, and for nine days and nights they were not dry once.

On the 15th the ship's figurehead was torn from the iron prow and swept out to sea, and heavy iron stanchions were broken off, while sea after sea swept the deck. The danger of being washed overboard was so great that the men were not allowed on deck, and the reindeer were of necessity left without food. Toward evening, there being a lull in the storm, the deer were fed. Captain Braes, who has been at sea for forty-two years, and his first officer, twenty-four years, testify that in all their experience they never encountered anything worse. The deer proved to be good sea travelers, learning to balance themselves with the rolling of the ship, and to rest by lying down the same as if they had been on their native pasture. The loss of one deer by death out of 539 was a very small thing; that death, however, was not due to the sea voyage, but to injuries received in fighting. The same might have occurred if they had been running at large on land. Whenever during the journey we encountered a snowstorm, the snow was carefully gathered from the decks by the Lapps in pails and carried to the pens for the use of the reindeer, and they ate it with avidity. The men were organized into gangs, with overseers, for the feeding and care of the deer upon the trip.

On February 27 our eyes were gladdened with the welcome sight of land off New England, and that evening we dropped anchor inside of Sandy Hook.

Digitized by Google

February 28, after the visit of the quarantine officers, the ship slowly steamed up to the cattle yards of the Pennsylvania Railroad in Jersey City, where the deer were immediately unloaded from the ship, and the following day loaded into cars that were waiting for them, and on the afternoon of March 1, in two sections, were started across the continent by way of the Pennsylvania, Wisconsin Central, and Great Northern railways to Seattle. At New York they were placed in charge of Lieutenant Devore, U. S. A., who accompanied them to Seattle, while I returned to Washington, D. C.

On the 10th of March I was detailed by the Commissioner of Education, under instructions from the Secretary of the Interior, to proceed to the Pacific coast and resume charge of the Lapps and the reindeer, which would be turned over to me by the officers of the Army in charge.

Leaving Washington on March 11, I overtook the reindeer herd at Seattle, Wash., on the 16th of March, where they were being loaded, under direction of Maj. W. R. Abercrombie, U. S. A., on the bark *Seminole*. They had been in Seattle nine days, while awaiting transportation to Alaska. To save the moss brought over from Lapland for the sea voyage from Seattle to Alaska the deer were taken to one of the city parks of Seattle and placed on the grass. As the result of the change of diet four died while there and eight others after leaving Seattle.

In accordance with a telegram from the Secretary of War to Brigadier-General Merriam of March 16, 1898, 40 of the Lapps, mainly women and children, were left at the Fort Townsend Barracks, to be sent later by sea to Alaska via the Aleutian Islands and St. Michael. Mr. Regnor Dahl, a Norwegian, acquainted with the Lapp language, was placed in charge of this colony, subject to the authority of Capt. William W. Robinson, jr., U. S. A. Mrs. Dahl was made matron and Dr. F. H. Gambell physician. The remaining 57 men, in charge of Mr. William A. Kjellmann, superintendent of the Government reindeer stations in Alaska, were sent on the *Seminole* with the reindeer, to drive the portion of the herd, turned over by the Secretary of War to the Secretary of the Interior, overland from Haines Mission into the Yukon Valley. As sickness in his family would prevent Mr. Kjellmann from accompanying the party longer than to see them started from Haines Mission inland, Mr. Hedley E. Redmeyer was appointed superintendent of the overland party. As some of the Lapps were sick with measles, Dr. Hermon F. Titus, a physician of Seattle, was employed to accompany the party as far as Haines, Alaska, at an expense of $300.

The *Seminole* left Seattle at midnight, March 10, in tow of the steam tug *Sea Lion*, and reached Haines Mission on the afternoon of the 27th. There were no barges at that place, and Captain Brainard, U. S. A., went to Dyea and returned with a barge, upon which the reindeer, sleds, and moss were landed on the beach during the 28th. Brigadier-General Merriam, commanding the Department of the Columbia, had sent instructions to the commanding officer at Dyea for tents and camping outfit, to be in readiness for the Lapp drivers, who were expected to proceed from Haines, on the coast, to Circle City, on the Yukon, a distance of over 1,000 miles, the longer portion of the way through an unknown region. Owing to the irregularity and unreliability of the mails in that section, the instructions, which were mailed at Skagway, did not reach the officer at Dyea, 6 miles distant, for nearly a week after they were due. This compelled the holding of the reindeer at Haines Mission for a week, and as there was no moss at that point, they were fed on dried alfalfa (the only forage to be had), which weakened them.

On March 29, two days after the arrival of the herd at Haines, an unusually early thaw set in, taking the ice out of the Chilkat River, rendering the trail to the moss fields on the head waters of the Thleheena (a tributary of the Chilkat River), where it was proposed to pasture the reindeer preparatory to driving them across the country to the Yukon Valley, for the time being impracticable. If transportation had been ready at Seattle as expected, thus saving the nine days' time lost at that point, and the necessary provisions for the Lapp drivers had been waiting their arrival at Haines, the reindeer herd could have been driven without any great loss either to Dawson or Circle City. But the above delays were disastrous. With unsuitable food, the deer grew weaker and weaker, until on March 31, three days after the arrival, they commenced dying. On March 31 two died; April 1 four, April 2 three, and April 4 three.

On the 3d of April the Lapp attendants found some moss above timber line on a mountain on the peninsula 12 miles south of Haines, and on April 15 the whole herd was driven to pasturage, reaching it on the 6th, ten days after their arrival at Haines. Eight died on the road, being five on the 5th and three on the 6th.

On the 4th of April, in accordance with instructions from the Secretary of War to the commanding general of the Department of the Columbia, Capt. B. Eldridge, U. S. A., divided the herd, reserving 200 head for the War Department, and turn-

Digitized by Google

ing over 326 head to the Interior Department. The herd, however, was by this time in such a weakened condition that it was not separated, and later on so many died that the 140 head that survived were left in charge of the Interior Department.

After driving the herd to temporary pasturage on the mountain the Lapps returned to Haines and proceeded to make up their rations and supplies—which had at length been received—into bundles of the proper size for packing, it being the plan to remove the camp from the beach 50 miles inland to the commencement of the moss pastures of the interior.

On the 8th of April, with a portion of the supplies loaded into native canoes and the balance strapped to the backs of the Lapps, they started up the Chilkat River, reaching Klukwan village at 11 o'clock Saturday night, where they remained in camp over Easter Sunday. On Monday morning, the 11th, they took up their march for the mouth of the Thleheena River, where the supplies were left in a temporary camp.

As many of the reindeer had died and more were dying from the effects of the starvation at Haines, it was concluded to be unnecessary to send as many men as was originally intended to Circle City. Accordingly 15 were detailed for the overland trip and left with their supplies at the camp on the Thleheena. The remainder returned with Mr. Kjellmann down the Chilkat River to Haines, arriving at noon on the 12th. They were immediately sent to round-up the herd and start them for the Chilkat Valley to the moss pasturage at the head of Thleheena River.

While on pasture 1 deer died on the 7th of April, 6 each on the 8th and 9th, and 5 on the 10th. As the small pasture that had been found soon gave out, the death rate increased to 10 on the 11th.

On the 12th the herd was gathered together and an effort made to drive them slowly north up the Chilkat Valley toward the abundant and permanent moss fields at the head of the river. They were so weak, however, that many lagged behind, and the herd became scattered along the 12 miles between the camp and Haines.

On the 13th the strongest deer reached camp opposite Haines, and Mr. Kjellmann received instructions from Captain Eldridge and Captain Abercrombie to keep the whole herd there until it should be determined whether any portion of the herd was in condition to accompany the military expeditions. Accordingly they were detained at that point until the 15th, during which days 14 died on the 12th, 22 on the 13th, 26 on the 14th, 28 on the 15th, and 34 on the 16th. On the night of the 15th the military expeditions sailed from Haines for Prince William Sound without waiting further on the reindeer.

Permission being granted, on the 16th of April the Lapps commenced collecting the herd and driving them northward. During the day a second band of deer overtook the first. Uniting the bands, the Lapps with the second band were returned to gather up more of the straggling deer.

On the morning of the 18th, while en route, a little moss was found on a steep mountain side. Camp was immediately made and all hands sent to pack the moss down in sacks to the deer.

On the 19th Mr. Kjellmann returned to the peninsula south of Haines, where the balance of the herd left on the 15th had remained. Finding that they were still too weak to be moved, he took a few of the stronger ones and on the 20th he overtook the first party on the Chilkat River. Joining the two parts of the herd into one, he sent back to the peninsula five men to care for the weak animals that had been left there and to try to move them slowly to the top of the mountain. The balance of the men were employed in cutting trees, gathering moss from the trees and rocks and carrying it to the main herd on the Chilkat River.

On the 24th, taking an Indian guide and 30 of the men, each pulling a sled loaded with rations, Mr. Kjellmann proceeded up the Thleheena Valley. He found the snow soft and deep and the weather rainy, so that very slow progress was made.

On the 27th he reached the moss fields on the north summit of the Chilkat or Thleheena Pass, about 50 miles from Haines. The moss was in great abundance and of the best quality. The rations were soon unloaded, the sleds reloaded with moss, and a start was made to return to the herd. When about 10 miles from the summit the moss was unloaded and a man sent down the valley to start the herd at once to the moss, the sleds returning to the summit for a second load. The men were now divided into two gangs, one drawing moss for the herd and the other pulling the sleds loaded with the rations for the men that were to make the overland journey.

On the 6th of May the 185 reindeer reached the north summit and were turned loose in the moss field to recover their strength. Forty-three deer were still left in the Chilkat Peninsula, making 228 alive at that date, out of 526 that were loaded at Haines.

Digitized by Google

The death roll from starvation was as follows:

Date.	Number.	Date.	Number.	Date.	Number.	Date.	Number.
Mar. 31	2	Apr. 10	5	Apr. 20	8	Apr. 30	2
Apr. 1	4	11	10	21	9	May 1	1
2	3	12	14	22	11	2	2
3	0	13	22	23	9	3	1
4	3	14	26	24	5	4	1
5	5	15	28	25	3	5	0
6	3	16	34	26	2	6	0
7	1	17	25	27	3		
8	6	18	28	28	1	Total	296
9	6	19	10	29	3		

As the herd would need to remain for some time at that point, and the care of the same was assumed by Mr. Redmeyer, Mr. Kjellmann, taking 43 of the men, returned to Haines, where he securely stored the sleds, and on the 15th of May embarked for Port Townsend, reaching that point on the evening of the 18th. Telegraphing to Vancouver Barracks for orders, he received instructions from Assistant Adjutant-General Davis to take his party to Fort Townsend, which he did, and left them in charge of Mr. Regnor Dahl.

After the departure of the men on the 8th of April for the Chilkat Pass, there being nothing further that I could do at that end of the line, I took boat on April 10 at Skagway, Alaska, reaching Seattle on the 15th, and Washington, D. C., on the 23d of April.

After the departure of Mr. Kjellmann from Mountain Camp, May 6, Mr. Redmeyer attempted to move the herd, but upon going 3 miles found they were too weak to travel any farther, when he again went into camp, which he named "Camp Pleasant," and where he remained until May 22. He then had 164 reindeer, which were all that had survived of the 185 that had reached Mountain Camp May 6; and of these a number were so weak that they could not digest the food, which was abundant around them. This still further reduced the number, until on September 1 there were 144 left, all of which, except three, had recovered their strength and health and were in good condition.

On May 22 Camp Pleasant, 53 miles from Haines, was left for the north. The snow was melting and was very soft, so that they could only travel at night when there was a crust. This necessitated so many delays that Mr. Redmeyer was forced to the conclusion that he would be unable to reach Circle City until late in the fall, and that the rations which he had with him would not suffice for the whole party for so long a time. He therefore again divided his men, sending eight of them, in charge of Mr. O. Paulsen, south to Seattle to join the others at Fort Townsend and be sent by steamer around by sea to St. Michael. He retained six with himself. The overland party then consisted of Hedley E. Redmeyer, Per Johannessen Hatta, Per Nilsen Siri, Klemet Persen Boini, Anders Alasken Bahr, Hans Andersen Siri, Emil Kjeldberg.

On September 27 the herd had reached the neighborhood of Hutchie Valley, at which time there was probably sufficient snow to enable them to again use sleds, after which Mr. Redmeyer expected to make more rapid progress on their way to Circle City. At Circle City Mr. P. C. Richardson, the contractor for carrying the United States mails up and down the Yukon Valley, expected to purchase the deer and employ them for carrying the mail.

On May 17 I left Washington on my return to the Pacific coast to look after the transportation of the Lapps from Fort Townsend to the reindeer headquarters near Unalaklik, Alaska, reaching Seattle, Wash., June 3.

On the 26th of May, 1898, the Secretary of War advised the commanding general of subsistence, at Vancouver Barracks, Wash., that, under instructions from the Secretary of the Interior, I would take charge of the reindeer recently bought in Lapland and turned over to the Department of the Interior by the War Department, conduct them to Alaska, and receipt for transportation and supplies for the herders, and supervise the payment of the salaries of the latter from the relief fund through the War Department. Accordingly, upon my arrival in Seattle, my first attention was given to securing transportation for the Lapps and their supplies. There was so great a demand for vessels to carry the large number of miners wishing to go to Alaska, together with the unusual quantities of freight, necessitated by the large emigration, that much difficulty was encountered in securing transportation.

However, on the 7th of June, after receiving bids as low as $9.75 per ton for freight on sailing vessels, an agreement was made with Mr. T. F. Townsley by which the rations for the Lapps were to be taken from Seattle to Unalaklik,

Digitized by Google

Alaska, on the steamship *Del Norte*, at the rate of $16 per ton, ship measurement, the usual rate for the same on well-established lines being from $50 to $60 per ton. Previous to signing the agreement I ascertained from the marine insurance agencies that the steamer was seaworthy. The steamer was to have sailed June 17, but, owing to various complications in which the Government was not interested, did not finally get away until June 28. It being necessary to take a few of the Lapps to a part of the coast of Alaska only reached by the *Del Norte*, 12 of them, including the 8 who had arrived from Haines Mission, were taken on board the steamer with a passage rate to Alaska of $40 each.

On June 8 I received word from Mr. Dahl, in charge of the Lapps at Fort Townsend, accompanied by the certificate of the visiting physician, that the two children of Johan Olesen Pulk, who were among those who had been sick with the measles while crossing the Atlantic, had developed a scrofulous affection that would very soon necessitate their being kept separate from the rest of the party, thereby destroying the service that their parents might otherwise render the Government. Under the circumstances it seemed best to return them to Lapland, and arrangements were made by which they started on the 10th of June on their return trip.

On the 12th of June, in compliance with telegraphic instructions from Major-General Merriam, dated June 5, 1898, Lieut. Henry C. Cabell, first lieutenant, Fourteenth United States Infantry, shipped to me from Dyea, Alaska, per steamship *Utopia*, all the relief supplies remaining unsold. The larger portion of these supplies was used by Major-General Merriam in rationing the Lapps to the 31st of January, 1899, and the excess of butter and bacon from the relief supplies over and above the amount required for the rations was subsequently (July 8), by direction of the War Department, turned over to the Interior Department for the use of the Lapps. The Dalton sleds belonging to the relief expedition not being needed, were not received by me, but were retained by General Merriam.

Arrangements were made with the Seattle Hardware Company for shipping the remainder of the Lapps on the schooner *Louise J. Kenney*, at the rate of $30 each for second-cabin passage, the Lapps furnishing their own provisions.

On the 21st of June the Laplanders were loaded on the schooner, when it was found that, unknown to me, the purser had taken on board 35 miners, which overcrowded the vessel and rendered it liable to seizure by the United States authorities for disregard of the emigration laws.

Going over to Port Townsend from Seattle, I removed from the vessel 30 Lapps with 6 children, and brought them to Seattle, where I secured a $30 rate (the same as paid on the *Kenney*) for them on the steamship *Navarro*, leaving 27 Lapps and 8 children on board of the schooner *Kenney*, which sailed on the evening of June 22 for Alaska.

On the *Navarro* Dr. C. P. Dolan was engaged as physician for the Lapps for the trip, at a cost of $43, and on the steamer *Del Norte* Dr. William J. Toussant was employed as physician for the Lapps during the trip, at an expense of $5. On the schooner *Louise J. Kenney* medical attention was given the Lapps by Dr. F. H. Gambell, their regular physician.

The steamship *Navarro* reached St. Michael on July 27. A day or two afterwards the same place was reached by the steamer *Del Norte*. The Lapps on the *Navarro* were transferred to the *Del Norte*, and on July 30 were landed at Unalaklik in the immediate vicinity of the reindeer station, the schooner *Louise J. Kenney*, with the first party of Lapps, having arrived on the 29th. Arrangements are in progress with the United States mail contractor for the Yukon Valley by which it is hoped the larger number of the Lapps will be distributed along the Yukon Valley as they shall be needed, for the purpose of carrying the United States mail.

NATURALIZATION OF THE LAPPS.

As an evidence of the purpose of the Norwegians and Lapps recently brought over from Lapland to become permanent citizens, the following persons have taken out their first naturalization papers: Magnusi Kjeldsberg, Johan Eira, Wilhelm Basi, Lauritz Stephansen, Johan Hilmar Hansen, Karl Johan Sacariasen, Ole M. Rapp, Alfred Hermansen, Ole Olsen Bar, Jeremias Abrahamsen, Isak Johannesen Hatta, Isak Salamonsen Nakkila, Per Andersen, Samuel Johannesen Balto, Nils Persen Sara, Nils Klemetsen, Lauritz Larsen, Otto M. Leinan, Hans Samuelsen, Ole G. Berg, Thoralf Kjeldberg, Peder Berg, Ole Johansen Stenfjeld, Karl Ove Suhr, Japeth Lindeberg, Ole Krogh, and Johan Petter Stalogargo.

The Lapps are well satisfied with their new home, and promise to make a very valuable and important addition to the population of Alaska and the development of its resources.

In my estimation, next to the discovery of gold the most important event commercially in the history of Alaska during this year is the importation of this

Digitized by Google

colony of Lapps. Experience is rapidly demonstrating that the only possible efficient transportation service in Alaska must be through the use of reindeer, and this necessitates the trained and expert drivers of reindeer found among the civilized Lapps and Finns. The 68 men that were brought over by this expedition are all picked men and expect to be permanent settlers of Alaska. They hope ultimately to have herds of their own and raise and train reindeer to sell to the transportation companies. Their success will naturally attract others of their people and render permanent the establishment of the reindeer industry in Alaska.

In this connection I make acknowledgments of the assistance rendered in the movement of the Lapps and reindeer by Brig. Gen. Henry C. Merriam, U. S. A., commanding the Department of the Columbia; also to Capt. W. W. Robinson, jr., U. S. A., at Seattle; Capt. B. Eldridge, U. S. A.; Capt. D. L. Brainard, U. S. A.; Capt. William R. Abercrombie, U. S. A.; Lieut. W. S. Graves, U. S. A., and especially to my associate, Capt. D. B. Devore, U. S. A., who shared with me in the perplexities, difficulties, and hardships encountered in Lapland.

TRIP TO SIBERIA.

Having landed the Laplanders with their rations on the beach a mile and a half below the village of Unalaklik, the steamer *Del Norte* raised anchor and sailed for Golovin Bay on the evening of August 1. Entering the bay on the morning of the 2d about 8 o'clock, the steamer went aground. Here we remained for twenty-four hours. Taking a small boat, a visit was made to the village and Swede mission station, and arrangements were made for landing the supplies for the mission and reindeer stations, which was successfully accomplished that afternoon.

Getting afloat about midday on the 3d, a start was made for the Teller reindeer station, which was reached on the morning of the 4th. The station was visited and inspected and we pushed on to St. Lawrence Bay, Siberia, which was reached on the morning of the 6th. Going ashore, I found that the station had been abandoned by the party in charge on the 3d of July. A conference was had with the natives and notice was sent to the owners of reindeer herds to drive their animals to the coast convenient for the ship. Then taking up anchor, we sailed out of St. Lawrence Bay around to the south side of South Cape. On Sunday, the floating ice coming in so thickly as to endanger the safety of the vessel, the captain shifted his anchorage inside of the bay. The following days were consumed in securing 100 reindeer, which had been previously purchased by the party in charge, and 61, which were purchased on the spot.

Having secured all the deer that was possible at the time and taken on board the furniture from the station and placed the houses in charge of one of the natives, the ship sailed for Cape Prince of Wales, reaching there on the night of the 10th of August. The surf being too rough for landing the deer, the vessel continued on her course into Port Clarence, where they were landed on the 11th at Teller reindeer station and placed in charge of Frederik Larsen, a Lapp herder, who was directed to drive them across the country and turn them over to Mr. W. T. Lopp, in charge of the American Missionary Association station at Cape Prince of Wales. These deer were for the purpose of returning in part those which had been previously borrowed from that station by the Government and sent overland to Point Barrow, to be slaughtered for food for the whalers that were imprisoned in the ice and out of provisions. The Rev. T. L. Brevig, who was in charge of the buildings, being desirous of spending the winter in the States, the custody of the buildings was given to Dr. Brandon, a physician and miner, who intended wintering at that place. Mr. Brevig and family coming on board of the steamer, we sailed on the night of the 12th for St. Lawrence Island, reaching there on the night of the 13th. The fog was so dense, however, that we were unable to find the village until the following morning.

On the 14th Mr. W. F. Doty, who had agreed to take for one year the school previously taught by Mr. V. C. Gambell (who was lost at sea while returning to his station in May), together with his annual supplies, was landed on the beach, and in the evening the steamer sailed for Unalaklik, which was reached on the 16th. Two days were spent in unloading supplies and arranging the affairs of the Eaton reindeer station. On the night of the 18th the *Del Norte* sailed for St. Michael, reaching there early in the morning of the 19th. On the 21st I was able to go on board the steamer *Roanoke* and start for Seattle, reaching there August 30. Leaving next day on the railway, Washington was reached on the 6th of September, 1898, thus closing a travel of 31,801 miles since the 23d of December, 1897.

Very respectfully, yours,

SHELDON JACKSON,
United States General Agent of Education in Alaska.

The COMMISSIONER OF EDUCATION.

CHAPTER XLII.

INSTITUTIONS FOR HIGHER EDUCATION.

GENERAL STATEMENT.

The year under consideration, it is generally conceded, has been a prosperous one for the universities and colleges of the country, although the latter part of the school year was attended with considerable excitement and a loss of students caused by the war with Spain. The reports of the presidents of some of the institutions show that quite a number of students left college before the close of the year to render service in their country's behalf. Notwithstanding the general prosperity of the higher institutions as a class, it is necessary to record the suspension of the following institutions for women: Synodical Female College, Florence, Ala.; Elizabeth Aull Female Seminary, Lexington, Mo.; Evelyn College, Princeton, N. J.; Mary Sharp College, Winchester, Tenn.; and Staunton Female Seminary, Staunton, Va. Pierre University, East Pierre, S. Dak., has been moved to Huron, S. Dak., and its name changed to Huron College. Three other institutions. formerly doing college work are now classed as secondary schools.

NEW HOME OF COLUMBIA UNIVERSITY.

One of the noteworthy events of the year was the removal of Columbia University from its former home in the heart of New York City to its new home. On the 4th of October, 1897, the university formally began its work of education in the new buildings which had been in course of preparation for it since the purchase of the site on Morningside Heights in March, 1892. In order to give some idea of the cost of the material equipment of a modern institution for higher education the following statement concerning the cost of the land, buildings, equipment, etc., of Columbia University on Morningside Heights is taken from the report of President Low, made to the trustees on October 3, 1898:

Cost of land	$2,000,000.00	
Legal expenses	3,637.95	
		$2,003,637.95
Library:		
Construction	1,100,542.09	
Equipment	97,037.38	
		1,197,579.47
Schermerhorn Hall:		
Construction	457,658.17	
Equipment	35,786.35	
		493,444.52
Fayerweather Hall:		
Construction	274,113.67	
Equipment	14,645.43	
		288,759.10
Havemeyer Hall:		
Construction	516,488.62	
Equipment	53,474.86	
		569,963.48

Digitized by Google

Engineering building:		
Construction	$284,075.50	
Equipment	20,325.47	
		$304,400.97
University building:		
Construction	842,887.85	
Equipment of power house and connections	115,578.52	
Equipment of gymnasium	39,399.24	
		997,865.61
Vaults:		
East	30,382.79	
West	37,316.40	
		67,699.19
Old buildings—repairs and equipment:		
West building	10,252.67	
College Hall	5,113.34	
		15,366.01
Insurance		3,754.40
Outside street work		133,367.81
Improvement of grounds and incidentals		403,373.75
Total		6,479,212.26

Even with this large expenditure of funds the university still needs dormitories, a chapel, a building for the college, a dining hall, an academic theater, and a building that shall be the headquarters of the social life of the students.

COLLEGE DORMITORIES.

While the larger number of institutions for higher education provide homes for their students, there are still a few of the universities that have not yet met this need. In these cases the students are compelled to seek rooms among the private homes or boarding houses of the cities in which such institutions are located. The University of Pennsylvania is one of the institutions which has but recently provided these facilities. The dormitory system, opened in 1896 and costing nearly $100,000, provides accommodations for nearly 400 students, and in 1897-98 all of the rooms were occupied. Concerning the advantages of the dormitory system, the provost, in his last report, says:

> The transformation which your board has made during the past four years has brought about an entirely new life, hitherto unknown at the university. For the first time there is a community of student life which has not become selfish or personal, and which, I believe, runs no risk of becoming either; indeed, that life is a robust one, and will more and more make itself felt. This identification of the student body with the University of Pennsylvania, of which they are more and more proud, is becoming contagious. It is observable in every throb of the great heart of the whole university. That it is due largely to the influence of Houston Hall, and to the establishment of the dormitories, with their individual "home" system and self-government, is evident to us all.

The provost pleads for the means of extending the dormitory system.

Columbia University, on moving into its magnificent new home, still finds itself without the means of offering homes to its students. President Low in his last report says:

> The time is at hand when the trustees must determine their policy in regard to dormitories upon the new site. The demand for them, as the sentiment reaches me, is almost universal, both among young and old. Some want them for the sake of what they call college life; others for the sake of securing that effect in education that is born of the community of scholars. * * * The wants of the student are few and simple. He is well content with a small room if it be clean. Neither does he need costly finish nor luxuriousness of furniture in any building which he is to occupy. What he does want is convenience to the university, a clean and well-kept room, plain but good food, and surroundings that lend themselves to study.

Digitized by Google

President Schurman, of Cornell University, emphasizes the need of dormitories by that institution. In his report for 1897-98 he says:

No provision is made by Cornell University for the social life of the men students. The women have a beautiful home in Sage College. But for the men there is nothing. In the absence of halls of residence for students Greek letter fraternities have sprung up; but, cordially as these are to be welcomed, they can not take the place of university halls, for they rest on an entirely different, and indeed antagonistic, principle. A residential hall is open to every student; a fraternity house is closed to all except the few who are invited to become members. The one is democratic, the other selective. Hence, if one looks deep enough, it will be apparent that the more fully developed the system of Greek letter fraternities at a university, the greater is the need of residential halls. And if, in addition to such halls, there were a dining hall in which the men from the fraternity houses and men from the public halls took their meals together, the arrangement would make for democracy and fraternity and tend to eliminate cliquishness and social sectarianism. If, furthermore, there were a club or common room contiguous to the dining hall, to which students might resort after meals, and in which they might associate during the intervals of relaxation, enjoying together the amenities of social intercourse, the plan would be a well-nigh ideal one. And how much education and culture—social, intellectual, moral, and political—the students would derive from one another, created, as it were, from the mere circumstance of their coming together! This inexhaustible potency is at present entirely lost at Cornell University, though it is of the highest value in the education of young men.

The president states that while the university has many other needs, he desires at this time "to accentuate the importance, for the spirit of the university as well as for the life and culture of its students, of a great system of halls of residence, with the conjoined features of a dining hall and clubhouse." The alumni have already taken steps to raise $150,000 for an alumni hall to be used as a clubhouse.

CONTINUOUS SESSIONS.

West Virginia University, at Morgantown, W. Va., has followed the example of the University of Chicago and has abolished the three months' vacation in summer. The scholastic year is divided into four quarters of twelve weeks each, with recesses of one week between quarters.

NEW COURSES OF STUDY.

The University of Chicago and the University of California have established colleges of commerce, whose organization and courses of study are described elsewhere in this report.

The Graduate School of Railway Mechanical Engineering was authorized by the board of trustees of Cornell University, in June, 1896, and was organized in February, 1898. The courses in this school will have special relation to the design, the construction, the operation, and the test trials of locomotives and other kinds of machinery employed in railroad operation.

The New York State College of Forestry, at Cornell University, established by an act of the legislature of the State of New York, approved March 26, 1898, was opened for instruction in September, 1898. The legislative act provides for the purchase and use of 30,000 acres of land in the Adirondack forests as a demonstration area, and that the College of Forestry "shall conduct upon said land such experiments in forestry as it may deem most advantageous to the interests of the State and the advancement of scientific forestry, and may plant, raise, cut, and sell timber at such times, of such species and quantities and in such manner, as it may deem best with a view to obtaining and imparting knowledge concerning the scientific management and use of forests, their regulation and administration, the production, harvesting, and reproduction of wood crops and earning a revenue therefrom." The college was organized by the appointment of Dr. B. E. Fernow, chief of the Division of Forestry of the United States Department of Agriculture, as director and professor of forestry, and of Filibert Roth, B. S., of the same division, as assistant professor of forestry and forest manager. There have bee

Digitized by Google

arranged a full four-year course leading to a degree of Bachelor of the Science of Forestry, a one-year special course, and a one-term synoptical course. The four-year course is planned to give a thorough knowledge of all branches of the profession and to prepare men to manage and administer forest estates for private owners, or for the State or National Government, and also to teach the profession in the colleges which are likely in the near future to establish chairs of forestry science and practice. This course comprises in its first two years the basal or preparatory studies of mathematics, natural science, engineering, political economy, etc., its last two years being devoted to the purely professional subjects. The one-year special course is planned for farmers, lumbermen, and others not desiring a general scientific training, but wishing to acquire such technical and practical knowledge of forestry as will enable them to manage more intelligently and economically their own woodlands. Finally, the one-term synoptical course will meet the requirements of students of political economy and others wishing to make a brief survey of the subject of forestry as a matter of general education.[1]

The School of Library Science, which had been conducted at Armour Institute of Technology, Chicago, Ill., since September, 1893, was transferred to the University of Illinois in September, 1897, and offers a four years' course of study leading to the degree of Bachelor of Library Science. Two years of the course are devoted to general university studies, and the last two years to technical library work.

RATIO OF STUDENTS TO POPULATION, 1872-1898.

The following tabular statement, giving the number of students in higher education to each 1,000,000 persons in the United States from 1872 to 1898, shows a very substantial increase for each class of students represented. As would naturally be expected, by far the greatest increase is shown in the column devoted to graduate students, the ratio having increased from 5 students in 1872 to 74 in 1898. The first column of students includes all undergraduate, collegiate, and technical students in universities and colleges for men and for both sexes, in colleges for women, Division A, and in schools of technology:

Number of students in higher education to each 1,000,000 persons from 1872 to 1897-98 (based on the number of students in the colleges of the United States).

Year.	Undergraduate collegiate and technical students.	Graduate students.	Law students.	Medical students.	Theological students.	Total.
1872	573	5	49	142	83	852
1873	739	5	52	176	93	1,065
1874	749	7	61	182	102	1,101

[1] Report of President of Cornell University for 1897-98.

Digitized by Google

STATISTICAL REVIEW, 1897-98.

Students.—The total number of students reported in collegiate, graduate, and professional departments of institutions for higher education and in professional schools for the year 1897-98 is 144,477, of which number 43,419 were enrolled as professional students pursuing studies in law, medicine, and theology, leaving 101,058 students reported as pursuing studies in the liberal arts and in technology. In this number are 5,514 graduate students, not including graduate students in professional departments, who remained at the various institutions for advanced study and research, an increase of almost 600 students over the number for the preceding year. The number of resident graduate students at certain institutions during the year was as follows:

Institutions.	Students in graduate departments.	Graduates in professional departments.	Total number of graduate students.
University of California	165	84	249
Leland Stanford Junior University	106	.....	106
University of Colorado	21	.....	21

The continued increase in the number of graduate students is one of the most encouraging features in the system of higher education. An examination of the catalogues of the various universities and colleges shows that a considerable number of professors and instructors obtain leaves of absence for the purpose of pursuing advanced studies and thus become better qualified for their teaching duties. That a very large proportion of the persons who obtain advanced degrees enter the teaching profession is shown by the occupations of persons who have received their degrees from the institutions which furnish such data.

During the year 1898 there was published a catalogue of the Graduate School of Harvard University from 1873 to 1898, containing the names, addresses, and occupations of 1,011 different persons who have received degrees from the school. The information contained therein has been carefully summarized in the report of the dean of the Graduate School to the president of Harvard University for the year 1897-98, from which the following extracts are taken:

Recipients of higher nonprofessional degrees from Harvard University (on examination), 1873-1898.

Of the 212 men who received the doctorate 171 are or have been teachers, chiefly in colleges. Sixteen are classified as scientists; 6 are clergymen, but 5 of them are or have been also professors in colleges or theological seminaries; 6 are lawyers or are in public life, and 7 are still continuing their studies, as a rule, in Europe.

Of the A. M.'s who are not also Ph. D.'s it is found that 72 are lawyers, 13 physicians, 61 clergymen, 12 journalists or authors, 7 librarians, 19 scientists, 28 in business, and 316 teachers.

The catalogue shows—not counting private tutors, assistants in college work, and a few doubtful cases—331 teachers in colleges (211 professors and 120 instructors) and 103 teachers in secondary schools.

The catalogue of Johns Hopkins University for 1897–98 contains the names of 439 persons who have received the Ph. D. degree. Of this number 382, or about 87 per cent, are or have been engaged in teaching, and 4 are still pursuing their studies.

The reports for 1897 and 1898 of Dr. Nicholas Murray Butler, dean of the School of Philosophy of Columbia University, contain the names of 51 recipients of higher degrees who are engaged in teaching. This list is very incomplete and does not include any of the graduates from the other graduate schools. In the report for 1897 Dr. Butler states that a majority of the candidates for higher degrees under the faculty of philosophy look forward to the teaching profession.

Residence of college students.—Tables 3 to 11 show the number of students from the several States attending the colleges of the United States, and the States and geographical divisions in which they attend college. From these tables it may be seen that of the 90,488 students included in this investigation, 33 are from Cuba, 17 from Hawaii, 5 from Porto Rico, and 751 from other foreign countries. In Table 4 are given the number and proportion of students attending college in the States and geographical divisions in which they reside. This table shows that a larger proportion of California students attend the colleges of their own State than do the students from any other State in the Union, and that the North Atlantic division leads all other divisions in holding the students from their respective sections of the country. Table 5 shows the number and proportion of students attending the colleges of the several States who are drawn from the localities in which such colleges are situated.

Degrees.—The number of degrees, excluding degrees in law, medicine, theology, dentistry, pharmacy, and veterinary medicine conferred in 1897–98 may be found in Tables 20, 21, 22, 28, 33, 39, and 40 of this chapter. There were conferred 12,150 bachelor degrees, of which number 8,256 were received by men and 3,894 by women.

Digitized by Google

Of the total number, 6,557 were A. B. degrees. The Ph. D. degree, on examination, was conferred on 267 men and 37 women. The number of honorary degrees reported as having been conferred during the year is 632, being 159 less than the number for the preceding year. The protests against the practice of conferring the degree of Ph. D. as an honorary degree seem to be having some effect, as the number of such degrees reported in 1897-98 is but 15, which is 50 per cent less than the number granted in 1896-97.

Property.—The total amount of money invested in universities, colleges, and schools of technology, as reported by the institutions, is $311,842,428, which is about $16,000,000 more than the amount reported in 1896-97. The endowment funds amount to $133,576,967, and the remainder represents the value of grounds, buildings, machinery, apparatus, and libraries used for instruction and research.

Income.—The total income of these institutions is reported as $25,963,242. Of this amount, $9,738,718 was derived from tuition fees, $6,414,363 from endowment funds, $6,498,338 was appropriated by the General Government and the various States and municipalities, and the remainder was received from miscellaneous sources. The receipts from endowment funds amount to an income of 4.8 per cent on the amount invested.

Benefactions.—The amount of gifts and bequests reported as having been received during the year is $8,204,281.

The summarized and detailed statistics concerning the institutions for higher education are given in the following pages:
